

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE AMERICANA

Neu Brandenburg, noi-brân'dén-boorg, Germany, a town of the grand-duchy of Mecklenburg-Strelitz, 20 miles northeast of Neu Strelitz near Lake Tollense. It was founded in 1248, and retains its picturesque mediæval ramparts and gateways. Its chief edifices are the Belvedere palace, and a 13th century Gothic church. It has manufactures of pianos, machines, paper, etc. Pop. (1900) 10,560.

Neu-Lauenburg, noi low'én-boorg, formerly DUKE OF YORK ISLAND, an island of the Bismarck Archipelago (q.v.) off the west coast of New Mecklenburg.

Neu Pommern, noi pôm'ern. See **NEW POMMERNIA**.

Neuchâtel, né-shâ-têl, or **Neuchâtel**, Switzerland, the name of a canton, town, and lake. (1) The canton in the west of the country, bounded by the cantons of Bern and Vaud, the lake of Neuchâtel, and France, has an area of 312 square miles. It lies in the midst of the Jura Mountains, four chains of which, running from northeast to southwest, traverse the canton, and are separated by elevated, longitudinal valleys. The greater number of the numerous streams which water the canton flow into the Rhine; several are feeders of the Lake of Neuchâtel mentioned below. Chief of the minerals is the asphalt of Val de Travers. Grazing is extensively attended to; wine, absinthe, fruits, hemp, and flax are produced. The manufactures are important; the principal are lace, cotton, clocks, and watches; a considerable industry is also carried on in cutlery, mathematical and philosophical instruments, chintz, and other cotton stuffs. The famous Neuchâtel cream-cheeses, however, are made, not in this canton as popularly supposed, but in France, at Neuchâtel-en-Bray, a small Norman town, 25 miles southeast of Dieppe by rail. Neuchâtel was an independent principality as early as 1034. After various changes of masters it came into the hands of the old French family of Longueville (1504), which became extinct in 1707. The king of Prussia, as heir of the house of Orange, was then called to the sovereignty by the states of Neuchâtel, and his title was confirmed by the Treaty of Utrecht. In 1806 Prussia ceded it to France, and the emperor conferred it on Marshal Berthier, afterward Prince of Neuchâtel-Wagram. By the Peace of Paris it was restored, with additions, to Prussia. In 1814 the principality was received into the Swiss Confederacy, and it was the only canton with a monarchical government, which it preserved till 1848. The religion is Protestant (Reformed). The language is French; but German is also spoken. Neuchâtel furnishes 960 men to the army of the Swiss Confederacy. Pop. (1900) 126,279.

(2) The capital, Neuchâtel, is 24 miles west of Bern, on a steep slope above the northwest shore of Lake Neuchâtel. It has an old Gothic church of the 12th century; many charitable institutions; a gymnasium or college, containing a valuable natural history collection found-

ed by Professor Agassiz, a native of the town, etc. It has various manufactures and an extensive trade. Pop. (1901) 20,843.

(3) The Lake of Neuchâtel (Neuenburgersee), 1,420 feet above sea-level, is 25 miles long, from three to six miles wide, with a maximum depth of 472 feet. The Thiele serves as its outlet, and carries its waters into the neighboring Lake of Bienné, and thence into the River Aar which communicates with the Rhine. The lake is plentifully supplied with fish; steamers ply on its waters between Neuchâtel, Morat, Yverdon, Estavayer, etc.

Neuendorf, noi'én-dôrf, **Adolph Heinrich Anton Magnus**, American musician: b. Hamburg, Germany, 13 June 1843; d. New York 4 Dec. 1897. He came to the United States when 12, was educated in the public schools and pursued a course in music. At 15 he made his début as a pianist, and the next year he led a chorus and played in an orchestra. In 1864 he was musical director of the German Theatre, Milwaukee, Wis., and in 1865 he conducted the German grand opera in New York. He founded the Germania Theatre in 1872 and managed it for 11 years; he assumed the leadership of the Philharmonic Society of New York in 1878, and later became director of the Metropolitan Orchestra. Among his compositions are: 'The Rat Charmer of Hamelin' (1880); 'Don Quixote' (1882); 'Prince Waldmeister' (1888), etc.

Neuhof, noi'hôf, **Theodor von**, **BARON**, German adventurer, King Theodore I. of Corsica: b. Metz 1686; d. London 11 Dec. 1756. His father was a Westphalian noble in the French service; the son became page to the Duchess of Orleans; fought in the French and in the Swedish armies; was employed by Count Goertz and then by Alberoni on diplomatic errands; married Lady Sarsfield, whom he deserted, having stolen her diamonds; lost all his property in Law's schemes; went to Florence in 1732; and there intrigued with some Corsican revolutionists, at whose invitation he landed in Corsica in 1736, with arms and equipment furnished by the Bey of Tunis, and was proclaimed king. He was at first successful against the Genoese, who, however, were reinforced by the French during Neuhof's absence in Holland; and he was defeated upon his return in 1738. After the withdrawal of the French in 1741, he made several attempts in 1743 to recover his kingdom and in 1749 retired to England, where he was jailed for debt, and was released in 1756, thanks to a subscription raised by Horace Walpole. His son, Colonel Frederick Neuhof, an English officer, wrote 'Mémoires pour Servir à l'Histoire de Corse' (1768). Consult Fitzgerald, 'King Theodore of Corsica' (1890).

Neuilly, né-yê, or **Neuilly-sur-Seine**, sûr sâ, France, a town in the department of Seine, suburban to Paris, immediately north of the Bois de Boulogne. The fine 18th century level bridge by Perronet, across the river here, is an attractive feature, and the town is noted for

its benevolent institutions, parks, and a handsome residential section built chiefly on the site of the historic royal castle and park of Neuilly, destroyed during the revolution of 1848. Neuilly also has factories of several Paris establishments for the production of domestic commodities.

Neumann, noi'män, Franz Ernst, German physicist and mineralogist: b. Joachimsthal 11 Sept. 1798; d. Königsberg 23 May 1895. He studied at Berlin, and became professor at Königsberg in 1828. His work in physics was of the greatest importance and he is reckoned the father of mathematical physics in Germany, and the founder of the modern theory of mineralogy by reason of his studies of the optical relations of crystals. He published a law of electro-dynamics different from that of Ampère and from Grassmann's; determined the diffusivity of soils and of metals; and studied reflection and refraction of light, induction currents, specific heat, etc. He contributed to various scientific journals. Many of his lecture courses were edited and published by his pupils; among these are 'The Theory of Magnetism' (1881), 'Introduction to Theoretical Physics' (1883), 'Theoretical Optics' (1885), 'Theory of the Potential' (1887), and 'Capillary Attraction' (1894). Consult the biography by Volkmann (1896).

Neumann, John Nepomucene, Roman Catholic bishop of Philadelphia: b. Prachatitz, Bohemia, 28 March 1811; d. Philadelphia 5 June 1860. He was educated at Budweis and Prague; took orders; came to America as a missionary in 1836; engaged in work near Niagara for four years; in 1840 entered the Redemptorist Order; and became assistant pastor of St. James' Church, Baltimore, in 1842. He was again busied in mission work in Pennsylvania, Maryland and Virginia; was appointed superior of the Redemptorist Convent in Pittsburg, where he built the church of St. Philomena; returned to Baltimore in 1847 as provincial of the Redemptorists in America; established the Sisters of Notre Dame in this country; and in 1851 became bishop of Philadelphia. He went to Rome in 1854 and assisted in the definition of the dogma of the Immaculate Conception. Bishop Neumann was a man of culture and of administrative ability. Consult the 'Life' by Berger (translated into English by Grimm, 1884).

Neumann, Karl Friedrich, German Orientalist: b. Reichmansdorf, Bavaria, 22 Dec. 1798; d. Berlin 17 March 1870. He was educated at Heidelberg, Munich, and Göttingen, and after travels in India and China (1829-30) from which he returned with a great number of Hindu and Chinese books, was professor of Oriental languages at Munich 1831-52. He was a Liberal in politics, a circumstance which finally cost him the loss of his professorship. Among his many works are 'Mémoires sur la Vie et les Ouvrages de David Philosophie Arménien' (1829); 'Asiatische Studien' (1837); 'Geschichte der Vereinigten Staaten von Nordamerika' (1863-6); 'Hoen Schein, or the Discovery of America by Buddhist Monks' (1874).

Neumann, Karl Gottfried, German mathematician, son of F. E. Neumann (q.v.): b. Königsberg 7 May 1832; he studied at Königs-

berg, became instructor of mathematics at Halle in 1858, was made professor at Basel in 1863 and at Tübingen in 1865, and since 1868 has been professor at Leipsic. His publications and special studies have been in the field of mathematical physics (following his father) and in higher analysis. Among his books mention should be made of 'The Mechanical Theory of Heat' (1875), 'Hydrodynamic Studies' (1881), 'Some Points in Mathematical Physics' (1893), 'Newton's Law of Attraction' (1896).

Neumayer, noi'mi-er, Georg, German meteorologist: b. Kirchheimbolanden, Bavaria, 21 June 1826; d. May 1909. He was educated at the University of Munich and went to Australia under the auspices of Maximilian II. and there founded the Flagstaff Observatory at Melbourne, where he made valuable magnetic observations. He returned to Germany in 1864 and promoted the German-African Company and organized several expeditions to the North and South Polar regions. He was long connected with the hydrographic bureau at Berlin and in 1876 became director of the Marine Observatory at Hamburg. He wrote: 'Die Beobachtungsergebnisse der deutschen Stationen im Systeme der internationalen Polarforschung' (with Börgen, 1886); 'Atlas des Erdmagnetismus' (1891); 'Anemometer-Studien' (1897); and 'Auf zum Südpol' (1901).

Neumayr, noi'mir, Melchior, Austrian geologist: b. Munich 24 Oct. 1845; d. Vienna 29 Jan. 1890. He was educated in his native city and at Heidelberg, becoming docent at the latter university in 1872 and full professor of geology there in 1880. He traveled extensively in the Carpathian Mountains, the Alps, Italy, Dalmatia and elsewhere in southern Europe, studying the Jurassic formations. He published 'Die Stämme des Tierreichs: Wirbellose Tiere' (1890); 'Erdgeschichte' (1885-7); etc.

Neumes, nūmz, in music, (1) signs or characters in early music indicating tones or phrases. A large number of these characters were used, being more or less complicated in form and meaning. This was the first step toward a graphic musical notation. (2) Melodic phrases sung to a single syllable, more particularly at the end of a sentence or clause. (3) Modulation of the voice in singing. See MUSIC; MUSICAL NOTATION.

Neumünster, noi'mün-stēr, Germany, a town in the Prussian province of Schleswig-Holstein, on the Schwale, 17 miles by rail southwest of Kiel. It is a well-built, busy manufacturing centre, producing principally woollens, and also leather, paper, ironware, soap, etc. Pop. about 30,000.

Neuquen, nā-oo-kān', Argentina, a territory in the western part of the republic, bounded on the west by Chile. Its area is 42,345 square miles. The main range of the Andes Mountains crosses the western part from north to south, and numerous short ranges extend throughout the territory. The Rio Negro and its largest tributaries have their rise in Neuquen, and the Rio Colorado is on its northern boundary. The principal occupations are mining silver and cattle-raising. The population is mostly Indians, but since 1884 a number of Chileans have settled in the territory. The

NEURALGIA — NEURASTHENIA

capital is Chocoma in the northern part. Pop. about 18,000.

Neuralgia (Greek *neur*, nerve + *algos*, pain), severe paroxysmal pain, either along the course of one or more sensory nerves, or at the place of their distribution. In neuralgia proper no definite lesions are discoverable. Sometimes there is reason to believe that inflammation of the sheath of the nerve is the starting-point. Not infrequently there are well-defined points of tenderness (ascertained by palpation) over the affected nerve, especially where it emerges upon the skin from a bony groove or opening. Sometimes with the pain there is a twitching of adjacent muscles. Radiation of pain, neuralgic in character, to nerve-branches other than those affected is quite common. Dental caries, for example, may produce supra-orbital neuralgia, and uterine disease, occipital neuralgia. Neuralgic pains are described by the sufferers as cutting, burning, boring, lightning-like, crushing, etc. After a neuralgic attack the part affected has a feeling of discomfort and bruising. There is frequently also a sense of exhaustion, with a desire to sleep. If there are repeated attacks of neuralgia, pallor of the skin, followed by intense redness, by hyperæsthesia, or by loss of tactile sensibility in the part affected, horripilation and other evidences of vasomotor disturbances are not uncommon. The disease may attack any part of the body, but is most common in the face. When involving the facial branches of the fifth pair of nerves (the trifacial nerves) it is popularly called *tic-douloureux*. There are severe flashes of pain over the eyebrows, in the eyes, nose, lips, chin, teeth, etc.

Neuralgias affecting various parts of the body are named in accordance with the part affected. Sciatica, for example, is neuralgia of the sciatic nerve, the pain extending down the back portion of the thigh and into the calf of the leg. Enteralgia is neuralgia of the bowels; gastralgia, of the stomach, angina pectoris, of the heart; intercostal neuralgia, of the intercostal muscles; and myalgia of the muscles in general. The presence of neuralgia, especially with repeated attacks, usually indicates a weak state of the general system, which may follow long-continued fevers. The disease may occur during the progress of various acute affections. The causes of neuralgia are various: poor blood and malnutrition, pressure of a tumor upon a sensory nerve, irritation of the nerve from the swelling of an adjacent part, exposure to cold and wet, fatigue, mental emotion, the abuse of tea, coffee, and alcohol, etc. The treatment varies with the nature of the different cases. Hot applications and anodyne liniments are often of value. As the pain is severe, persons affected are too often tempted to resort to narcotics for relief. Such drugs should not be used without the advice of a physician.

Neurasthenia (from Greek *neur*, nerve + *asthenia*, weakness), a condition of nervous debility or exhaustion; popularly called nervous weakness, nervous prostration, etc. The term is now generally applied to a disordered condition of the nervous system manifested by various symptoms. It was originally used in 1879 by Dr. George M. Beard. Nervousness, so called, is manifested chiefly by undue sensitive-

ness to external impressions. It frequently precedes or progresses into nervous prostration. The distinction between hysteria (q.v.) and neurasthenia is not always plain, for the two affections frequently merge into one another. Neurasthenia is not a disease; it is a neurosis, a functional derangement, usually lasting a considerable time, but generally recovered from under proper hygienic and medicinal treatment. No morbid anatomical changes are at present known. The disorder is caused sometimes by various functional and organic affections of the body, but in these instances there is probably a pre-existing basis of functional perverted action of the nervous system. Neurasthenia so produced is known as symptomatic. When certain symptoms predominate, distinctive terms are sometimes used; for example, in acoustic neurasthenia, symptoms of deafness; in gastric neurasthenia, weak digestive action, gastric pain (nervous dyspepsia); in cardiac neurasthenia, palpitations, irregular action of the heart, precordial pain, etc., symptoms simulating heart-disease; and in cerebral neurasthenia, despondency, irritability, moodiness, sleeplessness, restlessness, and confusion of mind, especially in relation to figures.

Neurasthenia is about as common among men as among women, and occurs usually between the ages of 20 and 50, when worry and work are maximal. Signs of a neurasthenic tendency are sometimes seen in young people (of a neuropathic or neurotic diathesis); namely, oversensitiveness, precocity, insomnia, chorea, somnambulism, and night-terrors. In girls especially there are also headache, backache, anemia, and lassitude. Sometimes neurasthenia marks the beginning of mental disease, such as melancholia. The causes of neurasthenia may be classified as predisposing (such as heredity and a neurasthenic tendency), and exciting or acquired. Mental irritability and the loss of self-control in parents are causes. So also gout, syphilis, rheumatism, and chronic alcoholism are conditions that transmit neurasthenic tendencies. Improper mental and physical training of children, and too much coddling are often responsible for the affection. Among the exciting causes are: injuries; severe mental and physical work for a length of time beyond the individual's power of endurance; worry, especially if associated with lack of rest, of pure air and of suitable food; and the excessive concentration of the thoughts upon one's self. So common has neurasthenia become in the strenuous, competitive life of America, especially in cities, that it is sometimes spoken of as "the American disease." Most individuals naturally have more nervous force and energy than is required for the ordinary necessities of life; while neurasthenia appears most frequently among those not in robust health and who are particularly susceptible to nervous impressions, quick, versatile, sensitive, and perhaps talented persons. Still persons of strong physical and mental powers, by reason of dissipation, overexercise, overeating and drinking, late hours, etc., may unduly tax their reserve supply of nervous energy, and sooner or later exhaust the nervous system and bring on mental and physical bankruptcy. The habit of high-pitched and rapid conversation and the use of exaggerated language, the ready willingness to call oneself

"nervous," the very common and unjustifiable use of the terms nervousness and nervous prostration, all tend indirectly to debilitate the nervous system and pervert its action. The use of the term "nervous" is an excuse for failure to do one's duty is too common. So used, it means weak-mindedness, the loss of self-control. "Nerveless" is a better term which has been suggested for such cases.

The symptoms of neurasthenia are many and various. The individual may appear to be in perfect health, but frequently has a worried look. There may be irritability of temper, fatigue without adequate reason, poor sleep, with exhaustion on waking, headache, with sense of weight or constriction, impaired memory, want of appetite, constipation, various forms of muscular weakness, muscular tremors and contractions, an uncertain gait, a feeling of weariness, giddiness, pain along the spine (spinal irritation) and in the joints, hyperæsthesia, or paræsthesia (numbness and tickling), sexual emissions, and defects of sight and hearing. There is no capacity for sustained work. The recognition of mental and physical weakness causes the individual affected to become self-conscious, to distrust others, to have a feeling of isolation, to prefer solitude, to exaggerate trifling impressions, to dread the dark, and to suspect contamination from food, touch, etc.

Treatment of this obscure nervous disorder requires considerable time and the care of a kind but firm physician and nurse, who have the confidence of the patient. The co-operation of the patient should be elicited in the plans for recovery. If possible, the change from familiar scenes and surroundings, from the tumult and cares of city life to the country, to life in the open, in the woods, by the seashore or in the mountains, should be effected. Complete rest (see RAST CURS), physical and mental, is the leading factor in the treatment. Travel, massage, electricity, induced sleep, carefully selected food, the removal of exciting causes, such as gout, lithæmia, and uterine disease, are all remedial and curative measures of importance in this affection.

Neureuther, Eugen Napoleon, German artist: b. Munich 13 Jan. 1806; d. there 23 March 1882. He began his studies at the Munich Academy, continued them at Paris (1830) and going subsequently to Rome (1838) fell under the influence of Cornelius (q.v.). In 1848 he was put at the head of the design department in the Royal Porcelain Manufactory at Nymphenburg, a position which he held until the sale of that establishment in 1856. He was engaged from 1868-77 as professor of design in the Royal Institution of Industrial Art. His brilliant versatility is shown in his skill as a house decorator, etcher, painter and industrial designer. He designed the border illustrations for Goethe's 'Ballads and Romances' (1829-40); he published 'Souvenir du 27, 28, 29 July 1830-1831'; and 'Bavarian Shepherd's Song with Illustrations' (1834). In 1835 he painted scenes from Wieland's 'Oberon' for the royal palace at Munich. For the *édition de luxe* of Herder's 'Cid' he produced 70 illustrations. His etchings after Mottmann's frescoes are admirable, and among his oil paintings are to be found in the Schack Gallery at Munich: 'Portia's Dream'; 'The Dying Nun'; 'The

Villa Mills'; 'The Villa Malta'; and a scene from 'Hermann und Dorothea.' He also furnished designs for the School of Industrial Art, and decorated the ceiling of the staircase and the cupola of the Polytechnique at Munich with graffito painting.

Neuridine, a ptomaine having the chemical formula $C_6H_{11}N_3$, which is formed during the putrefactive decomposition of flesh, appearing usually on the second day, and disappearing again on the fourth day. It also occurs in the fresh human brain, whence the name (Greek, "nerve"). Neuridine is a non-crystalline substance with an offensive odor, readily soluble in water, but insoluble in alcohol and in ether. According to some authorities it is intensely poisonous, while according to others it is not at all poisonous when pure.

Neurine, **Choline**, or **Sincaline**, a basic chemical substance having the empirical formula $C_6H_{11}NO_2$, or the constitutional formula $(CH_3)_3C_6H_2OH.NOH$. It occurs in putrefying flesh, in the fly agaric, in ergot, in beet-root juice, and in the actively-growing parts of numerous plants. It may be prepared by boiling pigs' bile or ox-brain with baryta. Neurine is a syrupy body with markedly basic properties and a strongly alkaline reaction. It is poisonous, and may be converted by oxidation into muscarine (q.v.), to which substance the poisonous qualities of the fly agaric are commonly ascribed.

Neuritis (N. Lat. from Greek *νεῦρον*, nerve + *itis*, a suffix denoting inflammation), inflammation of a nerve. Multiple neuritis is the inflammation of several nerves together. Varying with the cause, neuritis is traumatic, gouty, leprosy, endemic, alcoholic, etc. The disease may be acute or chronic, primary or secondary. It results from an inflammation, swelling, and thickening of the nerve-sheath and its prolongations. They may be associated with inflammatory and degenerative changes of the substance of the nerve. The principal symptoms of the disease are persistent burning pain, more or less severe, and a tenderness in the course of the nerve and at the points of its distribution. These are followed by or associated with muscular weakness or paralysis, numbness—loss of sensibility or hyperæsthesia—and atrophy of muscles. The causes of the disease are various; for example, injury to a nerve, as in dislocations and fractures; extension of inflammation from a neighboring part, poisoning by lead, arsenic, mercury or alcohol (see Poisons); gout, syphilis, cancer, diphtheria, and infection. The simpler forms of the disease are usually recovered from, under treatment, in a few weeks, although recovery may be imperfect. In severe forms death may occur in from a week to ten days, from paralysis of the inspiratory muscles, or after several weeks from exhaustion due to continuous pain and bed-sores.

Neuroglia, the connective tissue found in many parts of the nervous system, differing very materially in its general structure from that found in other organs, wherefore it has received its special name. It is also sometimes designated as spider-cells, because of the many-branched processes which the cells possess.

Neurology, that branch of science which treats of the structure and functions of the nervous system. It deals with that system under

NEURON—NEUTRAL NATION

all its aspects of form and condition, both in health and in disease, but especially with its pathological states, its hygiene, and its medical treatment. See **NERVOUS DISEASES**; **NERVOUS SYSTEM, EVOLUTION OF THE**; **NERVOUSNESS**.

Neuron. See **NERVOUS SYSTEM, EVOLUTION OF THE**.

Neuropt'ara, the order of "nerve-winged" insects, so-called by Linnaeus from the abundant supporting rods or "nerves" which ramify in a network throughout the wings. Since its establishment the original largely artificial group has been much restricted by the separation from it of large divisions. Typical *Neuroptera* have two pairs of large, equal, richly netted-veined, membranous wings, strong biting jaws, conspicuous, many-jointed antennae, a free prothorax and a complete metamorphosis. This order is of relatively slight economic importance, but the eight or ten families include many common and interesting American insects. See **ANT-LION**; **CONYALIS**; **DOBSON**; **LACEWING**; etc.

Neuro'sis (Greek *neuros*, nerve), an affection of the nervous system indicated by disordered sensation, volition, or mental expression, without any recognized lesion of parts, and sometimes without a discoverable adequate cause. Many abnormal conditions are now considered as neuroses; some of them result from nervous dyspepsia, shown by belching and eructation, by spasm and atony of the stomach, due to increased or decreased peristalsis, etc. Cardialgia and cardiospasm (functional disturbances of the heart) may produce such conditions. They are variously described, and include accident-neurosis, a neurosis following a severe injury; traumatic neurosis, following a severe wound; cyclist's neurosis, following excessive bicycle-riding; alcoholic neurosis, due to overuse of alcoholics; occupation-neurosis (see **OCCUPATION, HYGIENE OF**), indicated by spasmodic manifestations when attempting to perform movements peculiar to the employment of the individual, as the cramps of writers, milkers, etc.; and angioneurosis, a neurosis of the blood-vessels of a part. Herpes zoster is spoken of as a vasomotor neurosis, an exanthematous angioneurosis.

Neuro'tic. As an adjective, this term signifies having relation to the nerves. Physicians speak of neurotic individuals or subjects, neurotic ulceration, neurotic poisons, etc. As a noun the term was formerly chiefly applied in medicine to any substance—drug or poison—which acts especially on the nervous system, neurotics being classified as cerebral (morphine, etc.), cerebro-spinal (as aconite), and spinal (as strychnine). This use of the word neurotics has become obsolescent, and the term is now mainly reserved for sufferers from nervous disease or excessive nervous activity.

Neumetz, noi'zäts, or **Ujvidek**, ooy'vê-däk, Hungary, a town in the district of Bács, on the Danube, opposite Peterwardein. During the civil war in 1849 it was stormed and taken by the imperial troops under Jellachich, and almost destroyed by the fire of the insurgents from the castle of Peterwardein. It was rebuilt and is now a thriving trading and educational centre. Pop. (1900) 29,296.

Neuse, nûs, a river of North Carolina, which has its rise in the north central part of

the State and flows southeast into the Atlantic through Pamlico Sound. Its mouth is an estuary about 30 miles long, and is 10 miles wide at its mouth. It is about 310 miles long and navigable for about 100 miles. A number of streams flow into the Neuse but it has no large tributary.

Neusiedler See, noi'zêd-lêr-zê, Hungary, a lake in the northwest, between the counties of Ödenburg and Wieselburg, 30 miles southeast of Vienna. Its greatest length, north to south, is 23 miles, average breadth five miles, circuit about 60 miles. It is saline and shallow, its greatest depth seldom exceeding 15 feet; on the east side it is lost in the great morass of Hanság. Large quantities of salt crystallize on its shores in summer, consisting of a mixture of common and of Glauber salt. It contains abundance of fish, such as carp and pike, some of the latter being 70 or 80 pounds weight. Its frequent inundations occasioned great damage, till a canal was cut in 1800, to carry off its superfluous waters and discharge them into the Little Raab. The water several times has disappeared almost entirely. The last occasion was between 1865 and 1870, when crops were grown on its bed.

Neuss, nois, Germany, a town of the Prussian Rhenish province, on the Erft, near its junction with the Rhine, 21 miles northwest of Cologne. It has several fine churches, that of Saint Quirinus founded in 1209 being a notable transitional specimen from the Round to the Pointed style. The numerous industrial establishments include flour and oil mills, iron foundries, machine works, woolen and cotton factories, paper mills, etc.

Neustadt, noi'stât, or **Wiener-Neustadt**, vè'nêr-noi'stât, Austria, a town near the Hungarian frontier, on the Kerbach, 13 miles by rail, and by canal, south of Vienna. It retains its mediæval walls, and is dominated by the 13th century Babenberg ducal castle, now a military academy, and noted for its richly decorated Gothic chapel (1460), the burial place of Maximilian I. Locomotives and machinery, sugar, woolens, cottons, ribbons, starch, leather, pottery, wire, etc., are among the manufactures. The city was founded in 1192, and was rebuilt after the great fire of 1834.

Neustria, nûs'trî-s, or **West France**, the name given in the times of the Merovingians and Carolingians, to the western portion of the Frankish Empire, in contradistinction to Austrasia (q.v.), the eastern portion, the term being derived from *ne* (not) and *Austria*. The division took place at the death of Clovis in 511. Neustria lay between the Meuse, the Loire, and the Atlantic Ocean; after the cession of the northwestern portion to the Normans in 912, the name was applied to Normandy but soon fell into disuse. See **FRANCE**.

Neuter, a term formerly applied in zoology to those animals—represented chiefly among the *Hymenoptera*—in which the characteristics of sex are either present in a rudimentary condition or may not be developed at all. They are infertile females. Their status is given in the accounts, in this work of ants, bees, wasps and termites.

Neutral Nation, an American Indian tribe of the Iroquois family, formerly residing on the

NEUTRAL SALTS—NEUTRALITY

north shore of Lake Erie. The French called them the Neutral Nation because they took no part in the long war between the Hurons and the Iroquois. The Hurons afterward made war on the Neutrals and utterly destroyed them.

Neutral Salts. See SALTS; NEUTRALIZATION.

Neutral Tint, in art, a pigment used in water-colors, of a dull-grayish hue partaking of the character of none of the bright colors. It is prepared by mixing together blue, red, and yellow in various proportions.

Neutrality, in international law, a term applied to the status of a state which maintains an attitude of non-interference in respect to an existing war between other states, rendering neither aid nor service to either belligerent in his military operations. The doctrine of neutrality constitutes a large and increasing part of the existing body of international law, but in ancient and mediæval times it occupied almost no place. Grotius, in the first important treatise on international law ever written, gave but an insignificant place to the subject, whereas in any modern treatise it occupies a place hardly second to any. Among the states of the ancient world the status of neutrality hardly ever existed. War rather than peace was the normal state of mankind and when it existed practically all nations participated either as principals or allies. If one nation undertook to pursue a neutral policy it had few rights as such which any of the belligerents felt bound to respect and consequently it was more often to its advantage to choose an able ally as a means of self-protection rather than to remain neutral.

It was among the flourishing maritime states of the Mediterranean region, during the later Middle Ages, that the modern doctrine of neutrality had its origin, and the first recognition of neutral rights was embodied in a famous maritime code, the "Consolato del Mare," which declared that the goods of a neutral were exempt from capture although found on an enemy's vessel. This wise and liberal rule in time came to be adopted by all the European powers and continued as a generally accepted principle of maritime warfare until superseded by the more liberal rule embodied in the Declaration of Paris of 1856. By the latter declaration, which was acceded to by all the nations of Europe and America except Spain, the United States and Mexico, the principle that free ships make free goods was adopted, that is, the goods of an enemy (contraband of war excepted) under a neutral flag, and neutral goods (contraband excepted) under an enemy's flag, are free from capture. The United States refused to give its adhesion to the declaration for the reason that it was disinclined to surrender the right of privateering, the abolition of which was also one of the provisions of the declaration. The United States assumed this position chiefly because of the smallness of its navy and the consequent disadvantage it would suffer in a war with the larger powers were it prohibited from increasing its naval strength by accepting the service of privateers. The government, however, proposed to become a party to the declaration provided a clause were added exempting private property from capture at sea the same as on land but it

was never done and the United States has never formally given its adhesion. But as a matter of practice it has observed the rules of the declaration quite as scrupulously as if it had been one of the signatory powers.

Several forms and gradations of neutrality are or were formerly recognized. It may be *qualified*, as where the neutral state is bound by an anterior agreement to furnish one of the belligerents a contingent of troops or a sum of money; or *absolute*, as where the state abstains wholly from interference on the side of either belligerent, or *perpetual*, as in the case of Belgium and Switzerland, whose neutrality and inviolability have been guaranteed by the powers upon considerations which have to do with the preservation of the balance of power among European states; or *armed* as where several neutrals unite for the purpose of enforcing by armed intervention their views of neutral rights as against the aggressions of belligerent powers. The most notable examples of such alliances were the armed neutralities of the Baltic powers in 1780 and 1800 for the purpose of enforcing against England the neutral doctrine that "free ships make free goods." It should be said that international law no longer recognizes the right of a state to maintain a qualified neutrality. If it is under prior treaty obligation to furnish one of the belligerents with men, money or ammunition, however trifling the quantity, it becomes an ally as soon as it undertakes to carry out the treaty stipulations and is no longer entitled to be treated as a neutral.

The obligations and rights of neutrals are determined by the usages of international law, not by those of municipal law. In this connection it should be observed that in judging of the violation of neutral duties a distinction is made between the acts of a state and those which are individual in character. The act of an individual therefore in supplying a belligerent with arms or ammunition would not be considered as a violation by the state of its neutral duties, although it might be a violation of municipal law. It is not sufficient that the neutral treat each belligerent with impartiality; he must abstain from giving aid to either except where the ordinary dictates of humanity require. He must not lend either belligerent money, furnish him with troops or ships of war or any article susceptible of warlike use, or allow his territory to be made the basis of hostile operations or for the organization and equipment of hostile expeditions, or as a recruiting ground for the enlistment of troops, or allow prizes to be brought into his ports and there adjudicated, or allow his subjects to aid in the preparation or organization of a hostile expedition against a friendly power. In the three rules adopted by the Geneva Arbitration Tribunal in the case of the *Alabama Claims* (q.v.) it was declared to be the duty of neutral governments to use due diligence to prevent the fitting out and departure of such expeditions from their territory, to prevent their ports from being made use of by either belligerent for hostile purposes; and to exercise the same diligence in respect to all persons within their jurisdiction in order to prevent any violations of the foregoing duties. On the other hand, it is not a violation of neutral duty to discharge the duties of humanity to either belligerent as by

NEUTRALIZATION—NEUVILLE

allowing a belligerent vessel in distress to seek shelter in the neutral's port for the purpose of obtaining supplies or undergoing repairs or by furnishing asylum to a defeated and fugitive belligerent force. Nor is it at international law a violation of neutral duty when the subject of a neutral government in the ordinary course of trade sells to a belligerent firearms or other supplies which the latter may wish to buy. Likewise he may transport by ship to belligerents whatever they may want, subject, of course, to the right of the other belligerent to capture and confiscate such articles as may be deemed contraband of war. These are legitimate acts of trade unaffected by war, and neutral governments are not expected to interfere with them or assume responsibility therefor. Finally it is not a violation of neutral duty for one state to recognize the belligerency of another state at war or of a part of a state in rebellion against the established government. Nor is it a violation of neutral duty to recognize the independence of a revolted people when the revolt has reached such a stage as to give reason to believe that the revolutionists will establish their independence as a fact and maintain it.

The above enumeration of the duties of neutrals indicates in a rough way the *rights* which belligerents are bound to respect in the conduct of their warlike operations. They may be comprehended under the general head of complete immunity from the acts of either belligerent within their jurisdiction. No act of hostility may be committed by either belligerent within neutral territory nor within its territorial waters. Fugitive troops fleeing from an enemy may not be pursued in neutral territory nor may an armed vessel pursue and capture an enemy's vessel in neutral waters. As a means of enforcing its neutral obligations it is customary for states to enact *neutrality laws*, so called, making it criminal for their citizens or subjects to do certain specified acts which are considered to be violations of neutral duties, but such laws neither increase nor diminish the responsibility of the state enacting them. Consequently the state cannot plead the insufficiency of such laws or inability to execute efficient laws, in extenuation of its offense if it fails to enforce its neutral obligations. The foundation of the neutrality policy of the United States was laid during Washington's administration when upon the outbreak of war between England and France, Washington after a thorough consideration of our obligations to France, under the treaty of 1778, issued a public proclamation announcing that the United States would remain neutral and warned all citizens of the United States to abstain from giving aid to either belligerent. In the year following, Congress passed a neutrality act which as modified in 1818, and again in 1828, constitutes in all essential particulars the neutrality law now in force. It makes it a misdemeanor for any citizen of the United States to accept or exercise a commission to serve a foreign power in a war against a state at peace with the United States; or to enlist or to induce another person to enlist or to go beyond the jurisdiction of the United States to enlist in such foreign service; or to fit out, arm or augment the force of any armed vessel to be employed in such service; or to provide the means for setting on foot any military expedition against a

friendly state. No belligerent vessel is allowed to provide itself with military supplies in the territory of the United States, and the President is authorized to use force to send out of our territorial waters any vessel not entitled to remain therein. The neutrality laws of Great Britain are embodied in the Foreign Enlistment Act of 1870 and besides provisions similar to those contained in the laws of the United States they contain detailed and stringent regulations designed to prevent the building or equipping in British jurisdiction of ships intended to be used in war against a friendly power.

JAMES WILFORD GARNER,
Professor of Political Science, University of Illinois.

Neu'trali'sa'tion, in chemistry, the process by which a solution, originally acid or alkaline, is rendered neutral, or brought into a state in which it is neither acid nor alkaline. If the solution is originally alkaline, it is made neutral by the addition of an acid substance; and if it is originally acid, it is neutralized by the addition of an alkali. A solution of caustic potash, for example, is strongly alkaline, and turns red litmus paper blue almost instantly; but if hydrochloric acid is gradually added to it, the alkalinity becomes reduced in proportion to the quantity of acid added, until a state is finally attained in which the solution does not manifest either acid or alkaline properties, and does not affect the color either of red or of blue litmus paper. It is then said to be "neutralized," the neutralization being due to the fact that the potash has entered into combination with the acid to form a salt (potassium chloride) which is neither acid nor alkaline. If more acid is added than is required to effect precise neutralization, the excess renders the solution acid, and in order to make it neutral again, caustic potash or some other alkali must be added. It is often highly important, in chemistry, to effect the precise neutralization of a solution, and a method of quantitative chemical analysis, known as "volumetric analysis," is based upon the determination of the quantities of certain standard acid and alkaline solutions which must be added to the given solution, in order to precisely neutralize it. See CHEMICAL ANALYSIS.

Neuville, Alphonse Marie de, il-fôns mâr-rê dé nè-vêl, French painter: b. St. Omer 31 May 1836; d. Paris 20 May 1885. While he was for a short time the pupil of Picot, he must be considered largely a self-taught artist developing his talent under the direction of Delacroix. He made his first appearance as a battle painter with his 'Episode in the Crimean War' (1859), followed by 'The Trench of the Mamelon'; 'Zouave Guard' (Museum of St. Omer); 'The Battle of San Lorenzo in Mexico.' Meanwhile he was producing numerous illustrations for periodicals and for Guizot's 'Histoire de France.' He served as an engineer in the Franco-Prussian war and the second period of his artistic activity began. He tickled the vanity and boastfulness of his countrymen by depicting in his glowing and energetic canvases the French as chivalrous heroes, the Germans

NEUVILLE—NEVADA

as brutal barbarians, and became the most popular war painter of 'Young France' and the artistic representative of Chauvinism. Among his works with this tendency are: 'Bivouac before the Village of Le Bourget' (1872, Museum of Dijon); 'The Last Cartridge at Balan' (1873, familiar through its many reproductions), and numerous others often photographed or engraved and thus widely distributed. He left many aquarelles and drawings which were eagerly bought up.

Neuville, Jean Guillaume, zhōn gē-yōm, **BARON HYDZ DE,** French statesman: b. near Charité-sur-Loire, France, 24 Jan. 1776; d. Paris, France, 28 May 1857. He was educated at the Collège Cardinal Lemoine, Paris, and early became an active agent of the exiled Bourbon princes. In 1799 he interviewed Napoleon with the purpose to restore the throne to Louis XVIII., and later his estates were confiscated; but in 1806 upon his agreeing to exile himself to the United States, Napoleon refunded them. With the accession of Louis XVIII. in 1814 he returned to France and in 1815 was elected to the Chamber of Deputies. He was sent to the United States as minister and consul-general in 1816-21 and was then made ambassador to Portugal. In 1830 he became secretary of the navy. He wrote: 'An Historical Eulogy of General Moreau'; etc.

Neva, nēvā (Russian, *nyē-vā*'), Russia, a river which flows from Lake Ladoga, and after a westerly winding course of 40 miles, has its outlet in the Bay of Cronstadt, an inlet of the Gulf of Finland. It is best known as the river on the delta of which St. Petersburg (q.v.) is built. The river carries to the sea an enormous volume of water from lakes Ladoga, Onega, Ilmen, and others; in places it is over 4,000 feet wide, elsewhere narrows to 180 feet, and at one or two points navigation is obstructed by reefs and rapids; it is frozen over during five months of the year. The Neva connects with the Volga by the Ladoga Canal, and thus joins the Baltic with the Caspian Sea.

Nevada, nē-vā'dā, Emma, stage name of **EMMA WIXON,** American opera singer: b. Austin, Nev., 1862. She studied in Paris with Marchesi and made her first appearance in opera in London in 1880, as Amina in 'La Sonnambula.' She sang with success in Paris, Italy, and in the United States, where she toured in 1885. In 1885 she was married to Dr. Raymond Palmer.

Nevada, popularly known as 'the sagehen State' and 'the sage-brush State,' the name being derived from the Spanish, Nevada signifying 'snow-covered'; one of the Pacific slope States of the Union and one of the most important from the standpoint of mineral wealth. Nevada is bounded on the west by California; on the south by California and Arizona; on the east by Utah and Arizona, and on the north by Oregon and Idaho. It has an area of 112,090 square miles; extreme length, north to south, 484 miles, and width, east to west, 321 miles. Nevada ranks fourth in size among the States of the Union. The capital is Carson City.

Topography.—The northern portion of the State lies in the Great American Basin, included between the Sierra Nevada on the west and the Wahsatch Mountains on the east. This basin

forms a plateau 4,000 feet above the sea. There are numerous parallel ranges from 20 to 50 miles apart, running north and south through the State, broken by passes and valleys. In the southwestern portion a few mountains are scattered over an alkali plain. Some of these ranges rise above 9,000 feet. The highest point in the State is Wheeler Peak, near the centre of the eastern boundary, with an altitude of 13,058 feet. Other lofty mountains are White Pine, Piñon, Trinity, Humboldt, Santa Rosa, Lookout, Antelope, Diamond, Granite, Shell Creek, Goshoot, Desert, Opal, and Quartz. The mountains of Nevada show formations of nearly every epoch, from the Azoic to the late Jurassic.

Rivers and Lakes.—The southwestern part of the State has no waterways. The principal river, the Humboldt, rises in the northeast and flows across the State to Humboldt Lake. Several rivers rise in the Sierra Nevada and flow into lakes in the west-central part of the State. These include Walker River, Carson River, and the Truckee River. Pyramid Lake is the largest lake in the State and measures 35 miles in length by 10 miles in width. Lake Tahoe lies on the western boundary at an altitude of over 6,000 feet. It is 21 miles long. There are also Mud Lake, Carson Lake, Walker Lake, and others. In the north is the Owyhee River, a tributary of the Columbia.

Geology and Mining.—The mountains and surface rocks are composed of limestone, calcareous spar, granite, syenite, porphyry, and slate. Volcanic rocks occur in various places, and in the northwestern part of the State there are extensive lava beds. The minerals include silver, gold, antimony, lead, copper, mercury, coal, and nickel, and also sulphur, gypsum, and deposits of salt and borax. The extensive deposits of gold and silver created the State and made it famous through the Comstock Lode (q.v.), which produced as much as \$39,000,000 in bullion in a single year. (See **GOLD**; **SILVER**.) The annual estimated coining value of the gold production is \$4,500,000; silver, \$4,000,000; the copper production was over 750,000 pounds, and the lead production over 4,000 short tons. The building stones include limestone, granite, slate, sandstone, agate, and marble. Amethysts, carnelians, and tourmalines are also found.

Banking and Finance.—In the State in 1909 there were 13 National banks in operation, having 2,395 depositors and \$1,165,114 savings deposits; 14 State banks, with 2,262 depositors and \$1,234,813 savings deposits; and 3 private banks. On 1 Jan. 1910 the total bonded debt of the State was \$550,000. The total assessed valuation in 1910 was \$73,856,142, divided as follows: real estate, \$50,482,256; personal property, \$23,373,885. The State tax rate is \$8.00 per \$1,000. It appears by the 'Statistical Abstract' that in 1909 Nevada sent no report to the Comptroller on savings banks or loan and trust companies.

Irrigation.—Nevada became the scene of the first work performed under the Irrigation Law passed by Congress in 1902. Work was soon begun on what is called the Truckee dam, and the first contract called for an expenditure of \$900,000. The problem of irrigation has become the most prominent local question in Nevada, and the statement is frequently made that, with a greater supply and distribution of water, Nevada would eventually become one of

the foremost agricultural States on the Pacific slope. Chief Hydrographer Newell of the Geological Survey predicts that Nevada will have a population of 500,000 people within 50 years.

Agriculture.—It is the scanty rainfall rather than the poverty of the soil that has given the impression that Nevada is a desert. Very nearly 90 per cent of the improved area is under irrigation, with astonishing results. In the cultivated valleys the crops include spring wheat, barley, oats, potatoes, and vegetables. The State is well suited for stock-raising, which is carried on to a large extent. The white sage brush affords the best of winter pasturage, and much hay is cut along the river bottoms and in the valleys. The breeding of Cashmere and Angora goats is carried on to a limited extent. In 1910 the State had 19,000 milk cows, 404,000 neat cattle, 98,000 horses, 3,000 mules, 1,585,000 sheep, and 15,000 swine. The forest trees are chiefly pines, firs, and spruces of great size. The foothills are covered with mountain mahogany, dwarf cedar, willow, beech, cottonwood, and wild cherry. Apple, peach, pear, and plum trees flourish and bear excellent fruit.

Commerce and Industries.—Upward of \$3,000,000 is invested in the various industries of the State, although there are no manufactures of any particular prominence, the industries being small and varied. This is due largely to a lack of railroad facilities, Nevada having a smaller mileage than any other State in the Union, which is only about 1,000 miles. The Southern Pacific, running east to west through the State, is the principal line with a few smaller or branch roads. In 1905 there were reported by the United States census 115 manufacturing establishments, employing \$2,891,997 capital and 802 persons; paying \$693,407 in wages, and \$1,607,776 for raw materials; and having an annual output valued at \$3,006,374. The principal articles of manufacture include railroad cars, dairy products, flour and grain, printed material, saddlery and harness, clothing, chemicals, boots and shoes, brick and tile, wagons and carriages, confectionery, liquors, lumber and timber products, and salt.

Government.—The State is governed by the original constitution of 1864. Suffrage is restricted to male citizens 21 years of age, who have resided in the State six months and the district or county 30 days. The number of members of both branches of the legislature cannot exceed 75. Assemblymen serve two years and senators four years. Both are elected on the Tuesday after the first Monday in November of even years. A governor, lieutenant-governor, secretary, treasurer, controller, surveyor-general, and attorney-general are elected at the same time and serve for four years. There are a supreme court, district courts, and justices of the peace. A system of county and township government is established by the legislature. The State maintains an orphan's home, at Carson; a hospital for mental diseases, at Reno; and a State penitentiary at Carson.

Education.—The children of school age in the State number about 10,000; the enrollment (1908) was 9,761; daily attendance 6,910; and the total number of teachers was 414. The public schools are maintained by State and local taxes and are in charge of a State Board of Education and three superintendents. Educa-

tion is compulsory. There are about 677 pupils in the high schools and over 250 in the Nevada State University (q.v.), a coeducational institution located at Reno, in connection with which the United States government has established an agricultural experiment station. The government also maintains a school for Indian children. The public school property is valued at about \$350,000. The annual expenditures amount to about \$660,000. For higher education there are public high schools at Austin, Carson City, Eureka, Gold Hills, Reno, Dayton, Wadsworth, Winnemucca, and Virginia City.

Churches.—The strongest denominations in the State are the Roman Catholic, Protestant Episcopal, Mormon, Methodist Episcopal, and Presbyterian. There are about 75 Evangelical Sunday-schools, with 1,000 officers and teachers, and 4,000 scholars.

Political.—Nevada, more than any other State in the Union, is largely controlled politically by local interests. It was counted as Republican up to 1892, when it cast its vote for the candidates of the People's Party. In 1896 it voted for free silver, in 1900 cast its vote for William J. Bryan for President, and in 1904 cast its 3 electoral votes for Roosevelt. The first and only Territorial governor was James W. Nye (1861-4). In the State elections Nevada has elected five Republican governors, two Democratic governors, two Silver Party governors, and one Silver-Democratic governor.

History.—Nevada was originally a part of California, known as "the Washoe Country," until it was organized as a Territory in 1861. It was first visited by the white man in 1775, when Francisco Garcés, a Franciscan friar, stopped here on his way to California. In 1825 Peter Ogden, of the Hudson Bay Company, visited the Humboldt River, which for a time was called the Ogden. In 1826 Jedediah S. Smith crossed the State from west to east. Fremont passed through the State in 1843-4-5, and occasional immigrants to Oregon or California settled here. In 1849 the Mormons founded a trading post on the Carson River, near Genoa. A part of the State was included in Utah Territory, when it was organized in 1850, but in 1853 the settlers in the Carson Valley petitioned to be annexed to California, claiming that Utah did not protect them. A petition for Territorial government was sent to Congress in 1857, and in 1858 a provisional government was formed at Carson City with Isaac Roop as governor. In 1860 another petition was sent to Congress and the Territorial delegate applied for admission. The Comstock Lode was discovered in 1859, and miners flocked into the district from the east and north and from California. At the outbreak of the Civil War the scanty population sent loyal troops to the front and Nevada citizens donated \$50,000 in silver bricks to the Sanitary Commission. In September 1863 an election was held for delegates to form a State constitution, but the proposition was defeated in January 1864. The political situation made two additional Republican votes in the United States Senate exceedingly desirable, and Congress, in March 1864, again passed an enabling act, in July the constitution was accepted, and the State was admitted 31 Oct. 1864. The great Sutro Tunnel (q.v.) designed for drainage and access to the mines of the Comstock Lode, was com-

NEVADA — NEVIN

structed in 1879. The silver product of the State from 1859 to 1869 amounted to \$137,382,000, and this had much to do with gaining Nevada a place in the Union.

Population.—In 1883 Nevada at its zenith had a population of 66,265, including 3,152 Chinese and 4,000 Indians. In 1903 the population was about 40,000. The census for 1890 reported a population of 45,761, and in 1900 of 42,335. The decline of the mining industry of the State, and failure to develop in other directions, has caused the diminution of population. The recent development of the gold mines of the State, however, has caused a large and steady influx of miners and speculators, and several modern, well-built and prosperous towns, such as Tonopah, Goldfield (in 1907 made the county-seat of Esmeralda County), Rhyolite, and Manhattan, have sprung into existence since 1900 and are rapidly increasing both in size and importance. The State still has (in 1910) the fewest inhabitants of any of the States—81,875. The capital city is Carson; other large cities and towns are Reno, Virginia City, Elko, Eureka, Austin, Wadsworth, Delamar, Winnemucca, and those mentioned above.

Nevada, Iowa, city, county-seat of Story County; on a branch of the Chicago & Northwestern railroad; about 30 miles north by east of Des Moines. It is in an agricultural region in which stock-raising is a prominent industry. Its chief manufactures are flour, brick, tile, lumber and dairy products. It has a large cold-storage plant, and considerable trade in dairy products, poultry, eggs, grain, flour, and live-stock. The public library contains about 5,500 volumes. Pop. (1910) 2,138.

Nevada, Mo., city, county-seat of Vernon County; on the Missouri, K. & T., and the Missouri P. R.R.'s; about 130 miles southwest of Jefferson City and 100 miles south of Kansas City. It was settled about 1830 by a colony from the eastern part of the State, incorporated in 1865 or 1866, and chartered as a city in 1883. It is in an agricultural and stock-raising region, and in the vicinity of the zinc mines. Its manufactures are chiefly local. The number of men employed in railroad shops and manufacturing establishments is about 1,000. The city has considerable trade in agricultural products and live-stock, and it is a distributing centre for a large part of Vernon County. Its educational institutions are public schools, Cottey College for Young Women, opened in 1884 under the auspices of the Methodist Episcopal (South) Church, and Saint Francis Academy (R. C.). It has an orphan asylum, the State Lunatic Asylum, and Artesian Lake Park. The three banks have a combined capital of \$250,000. The government is vested in a mayor and a council of 10 members, who hold office two years; five councilmen are elected each year. Pop. (1890) 7,262; (1900) 7,461; (1910) 7,176.

Nevada State University, first founded at Elko in 1873, then removed to Reno and opened in 1886. It is a part of the public educational system of Nevada and the only school of collegiate grade in the State. Besides the regular collegiate courses in the classics, literature and general science, there are courses in agriculture, civil, mechanical, and mining engineering, and domestic science; also a business course; a nor-

mal and a preparatory department. In the agricultural department short winter courses are offered in agriculture, dairying and domestic science. In 1901 a branch school of mines was established at Virginia City under the head of university extension. The State Experiment Station is also connected with the university. The degrees conferred are A.B. and B.S., with the corresponding masters' degrees for graduate work. Women are admitted and constitute fully half the number of students; military drill for the men is a part of the curriculum. As the agricultural department is connected with the university, it receives the income from the Federal land grants for agricultural colleges; the total income in 1910 amounted to \$210,000. The students numbered 280, and the faculty 40.

Névé, ná-vá. See GLACIER.

Nevers, nè-vâr, France, the capital of the former province of Nivernais, now of the department of Nièvre, picturesquely built on the slope of a hill 600 feet above sea-level, at the influx of the Nièvre to the Loire, 159 miles southeast of Paris. It was the Roman Noviodunum, and has been an episcopal see since 506; its 13th century cathedral has been restored since 1879; the 11th century Romanesque church of St. Etienne is interesting. The stately court-house, dating from 1475, was formerly the castle of the Dukes of Nevers. The city contains a fine public garden, a bridge of 14 arches over the Loire, a mediæval gateway, housing a museum of Gallo-Roman antiquities, and a triumphal arch (1746) commemorating Fontenoy. The industries comprise the manufacture of cannon, iron cables and chains, porcelain (introduced by Italians about 1565), etc. Pop. about 30,000.

Neversink Highlands. See NAVESSING HIGHLANDS.

Neville, nèv'îl, Henry, English actor: b. Manchester 20 June 1837; d. 19 June 1910. He achieved great success on the London stage, where he first appeared in 1860, and later took the chief rôle in 'The Ticket of Leave Man.' He was lessee of the Olympic in 1873-9, and established a dramatic school in 1884. Besides plays, such as 'The Duke's Device' and 'The Violin-Maker,' he wrote 'The Stage: Its Past and Present'; 'Gesture' (in Campbell's 'Voice, Speech, and Gesture,' 1895).

Neville, Richard, earl of Warwick. See WARWICK, RICHARD NEVILLE, EARL OF.

Neville's Cross, Battle of. See BRUCE, DAVID.

Nev'in, Ethelbert Woodbridge, American composer: b. Edgeworth, Pa., 25 Nov. 1862; d. New Haven, Conn., 17 Feb. 1901. He obtained his musical education in Pittsburg and in Berlin and after three years spent in the latter city returned to the United States and opened a studio in Boston. He appeared in public occasionally but his reputation rests chiefly upon his compositions which date from his 12th year. 'Narcissus,' which has a world-wide popularity, was written when he was 13, and 'O, that we Two were Maying' a year later. Other compositions are: 'A Day in Venice'; 'Cradle Song'; 'Milkmaid's Song'; etc.

Nevin, John Williamson, American Reformed (German) clergyman: b. Shippensburg,

NEVIN—NEW BEDFORD

Pa., 20 Feb. 1803; d. Lancaster, Pa., 7 June 1886. He was graduated from Union College, Schenectady, N. Y., in 1821 and from Princeton Theological Seminary in 1826, where he remained for a few years as tutor. He was professor of Hebrew at the Presbyterian Theological Seminary at Allegheny City 1829-39, became president of the Mercersburg Theological Seminary in 1840 and was president of Marshall College 1841-53. His translation of Schaff's 'The Principle of Protestantism' created the once famous controversy over 'Mercersburg Theology' (q.v.), of which he was for the rest of his life the principal advocate. He edited the *Mercersburg Review* 1840-53, resigned from the presidency of the Seminary in 1851 and from Marshall College in 1853. In the last named year the college was removed to Lancaster, Pa., and merged with Franklin College, Dr. Nevin serving as president of Franklin and Marshall College (q.v.) 1866-76. He published 'The Mystical Presence' (1846); 'The History and Genius of the Heidelberg Catechism' (1847); 'Antichrist or the Spirit of Sect and Schism' (1848).

Nevin, Robert Jenkins, American Episcopal clergyman: b. Allegheny, Pa., 24 Nov. 1839. d. Mexico City, Mexico, 20 Sept. 1906. He was a son of John Williamson Nevin and was graduated from Franklin and Marshall College, Lancaster, Pa., in 1859; he served through the Civil War in the Union army, attaining the rank of brevet-major. He was ordained in 1867 and from 1869-96 was rector of St. Paul's American Church in Rome which he built in 1870-6. He wrote: 'St. Paul's within the Walls' (1878); 'Reunion Conference at Bonn' (1875); etc.

Nevins, Winsford Scott, American journalist: b. Brunswick, Maine, 6 Dec. 1850. He has been connected with the *Boston Herald* for 30 years and was president for four years of the school board of Salem, Mass. He has published 'Old Nantucket' (with Webber) (1878); 'Guide to North Shore of Massachusetts' (annually, 1880-96); 'The Intervale, New Hampshire' (1887); 'Witchcraft in Salem Village' (1892).

Nevinson, Henry W., English journalist. He was a war correspondent of the *London Daily Chronicle* during the Greco-Turkish war of 1897, and also from the Transvaal and Natal during the Boer war in 1899. He has published 'Life of Schiller' (1880); 'Neighbors of Ours' (1895); 'In the Valley of Tophet' (1890); 'The Thirty Days' War' (1898); 'Ladysmith' (1900); 'The Plea of Pan' (1901).

Nevis, West Indies, one of the Leeward Islands, belonging to Great Britain, two miles southeast of Saint Christopher, with which, since 1882, it is administratively connected. It is circular in form, rises in the centre to a wooded ancient crater (3,200 feet), and has an area of 90 square miles. The lower slopes are cultivated, the sugarcane being the principal crop; limes and oranges are grown to a small extent. The capital is the port of Charlestown. Nevis was discovered by Columbus in 1498 and colonized by England in 1628. In the 18th century it was twice taken and restored by the French. Pop. about 15,000.

New, Clarence Herbert, American author: b. New York 1862. He was educated at the

Polytechnic Institute of Brooklyn, and engaged in travels which took him all over the world. In 1886-92 he was a constructing engineer and became lieutenant of naval volunteers in 1891-3. Since 1898 he has been a publisher. He has written: 'Franc Elliot' (1894); 'Chronicles of Murphy's Gulch' (1898); etc.

New, John Chaffant, American financier: b. Vernon, Ind., 6 July 1831; d. 4 June 1906. He was graduated from Bethany College, Va., in 1851 and studied law, becoming clerk of Marion County in 1856. In the Civil War he served as quartermaster of Indiana until his election to the State senate in 1862. He was cashier of the First National bank of Indianapolis in 1865 and later its president. He was United States treasurer in 1875-6 and served as assistant treasurer in 1882-4. He was appointed consul-general at London in 1889 by President Harrison and was proprietor of the *Indianapolis Journal*.

New Albany, Ind., city, county-seat of Floyd County; on the Ohio River, and on the Baltimore O. & S., the Pittsburg, C. C. & St. L., the Louisville, E. & St. L., and the Louisville, N. A. & C. R.R.'s; nearly opposite Louisville, Ky., and about 110 miles south of Indianapolis. It was laid out for a city in 1813, and in 1839 was incorporated. It is two miles below the falls in the Ohio River (See *LOUISVILLE*) and has extensive water-power. Its chief manufacturing establishments are large glass works, pork-packing establishments, tanneries, engine and boiler works, furniture factories, flour mills, rolling mills, lumber and planing mills, and foundries. It has a large trade in its manufactures, the farm products of Floyd County, and in building material. Some of its prominent buildings are the government building, the city-hall, courthouse, fair-ground buildings, the churches, and the schools. It is the seat of De Pauw College for women, Saint Mary's Academy (R.C.), Holy Trinity Academy (R.C.); it has public and parish schools and a free public library. Outside the city limits is a National cemetery in which are 2,908 graves, 676 of unknown dead. The government is administered under the charter of 1839 and provides for a mayor, who holds office four years, and a council. Some of the administrative officials are appointed by the mayor and the others are elected by the council. Pop. (1910) 20,629.

New Albion, the name given by Sir Francis Drake, in 1579, to the coast of North America. Humboldt and later writers restricted the name to the region between San Francisco and what is now the northern boundary of the State of Oregon.

New Amsterdam. See *NEW YORK*.

New Archangel. See *SITKA*.

New Atlantis. See *ATLANTIS*.

New Bedford, Mass., city, port of entry, one of the county-seats of Bristol County; on the Acushnet River and New Bedford Harbor, an arm of Buzzard's Bay; and on the New York, New Haven & Hartford railroad. It is connected with Fall River, Brockton, Onset, and Dartmouth by electric lines, and by steamers with New York, Martha's Vineyard, and other places, and is 56 miles south of Boston. It was settled in 1652 by John Cook and others from Plymouth, and was a part of Dartmouth until

NEW BRAUNFELS—NEW BRIGHTON

It was incorporated in 1787; chartered as a city in 1847. It was once noted for the number of its inhabitants engaged in the whale fisheries, but since 1860 its whaling interests have decreased and its manufacturing industries increased. The town occupied a prominent place in the Revolution, especially in sending out privateers which harassed the enemy and captured many of the British vessels. On 5 Sept. 1778 the town was attacked by a British fleet, captured and almost destroyed. The harbor is protected by Fort Rodman, on Clark Point. A large lighthouse is on Palmer Island at the entrance of the harbor. The area of New Bedford is nearly 20 square miles. It is well laid out, the streets are clean and nearly all paved. Fine roads along the shore, good views of the sea, opportunities to go out into the country on electric cars, all add to the attractiveness of the city which is now a most important manufacturing centre. The chief manufacturing establishments are 41 cotton mills (1904), representing a capital of \$24,000,000, and having 1,603,080 spindles and 16,000 employees; the Twist Drill Company, 500 employees; cordage works, 400; one of the large shoe factories has 900 employees; woolen mill, 200; glass works, 300; paint works, 500; and 50 other industries, all giving employment to thousands of people. In 1908 New Bedford received 215,000 bales of cotton, new cotton mills were erected, and the old mills enlarged. New Bedford ranks first of the cities of the United States in the manufacture of fine cotton goods and fine cotton yarns, and second in the number of spindles. The total number of building-permits granted during 1902 was 470, at an estimated cost of \$2,000,000. The city has an extensive trade; its manufactured articles are exported to nearly all parts of the world. The coal received at its docks (1904) amounts to over 600,000 tons annually, and it is a distributing centre for large quantities of food products which are brought from other parts of the United States and from other countries. Among the prominent buildings are the government building, the city-hall, county court-house, the Merchants' National Bank, Masonic and Odd Fellows' buildings, Saint Luke's Hospital, Saint Mary's Home for Aged and Orphans, and a State Army. The public parks have a combined area of about 260 acres. The bridge which spans the harbor and connects Fairhaven and the east side with the city cost \$1,500,000. The educational institutions are 30 public schools, five parish schools (R.C.), the Swain Free School, a State Textile School, a kindergarten (R.C.) and a public library which contains about 74,000 volumes. This library was founded in the early part of the 19th century, but did not become a municipal institution until 1856. There are 50 churches several of which are fine buildings. The national and trust company banks have a combined capital of \$2,800,000; the savings banks have deposits (1903) amounting to \$22,161,694.

The government is administered under the revised charter of 1896 which provides for a mayor, elected annually, a board of aldermen and a council. There are 6 aldermen and 24 members of the council, 4 from each ward. The mayor appoints, subject to approval of the board of aldermen, the license and the park commissioners and the board of health. The council

elects the officers of the fire department, the overseers of the poor, and the water board. There are two sources of supply of water, one opened in 1869, the other in 1899. The whole cost the city about \$3,150,000. The water of the first plant is now held in reserve for emergencies, and great precautions are taken to have an uninterrupted flow of water in case of fire. There are now about 110 miles of water mains. The annual municipal expenditures for maintenance and operation are about \$1,010,000. The chief items of expense are, for schools, \$236,000; for police department, \$114,000, streets, \$71,000; fire department, \$81,000, charitable institutions, \$75,000; lighting, \$50,000; interest on debt, about \$150,000. There is a large foreign element, chiefly French Canadian, in the city, but all who have made permanent homes here are becoming American. The nationalities represented (1 Jan. 1904), are about as follows: French Canadian, 15,000; Portuguese, 12,000; English, 10,000; German, 2,000. The total population (1890) 40,733; (1900) 62,442; (1910) 96,652, an increase of 54.8 per cent.

Consult: Rickeston, 'History of New Bedford'; 'Centennial in New Bedford.'

Editor, 'Evening Standard.'

New Braunfels, brown'fēlz, Texas, city, county-seat of Comal County; on the Guadalupe River, at the mouth of the Comal, and on the Missouri, K. & T., and the International & G. N. R.R.'s; about 30 miles southwest of Austin, the capital, and 30 miles northeast of San Antonio. The short stream called Comal River has its source in artesian springs, and furnishes the city industries with an extensive volume of water. It is in a productive agricultural region in which stock-raising is given considerable attention. The chief manufacturing establishments are large flour mills, tannery, brick works, wagon factory, and cottonseed-oil mills. The trade is chiefly in wheat, flour, cotton, and live-stock. The inhabitants are nearly all Germans or of German descent. Pop. (1890) 1,608; (1900) 2,097; (1910 est.) 2,200.

New Brighton, brit'ŏn, Pa., borough, in Beaver County; on the east bank of Beaver River; two miles from its junction with the Ohio, and on branches of the Pennsylvania and the Pittsburg & L. E. R.R.'s; 28 miles northwest of Pittsburg. It was settled in 1799 by the laborers employed to build Wolf's mill,—a flouring mill; laid out in 1818, and incorporated as a borough in 1838. Coal-fields and fire-clay beds are in the vicinity. It is in a section of the State in which manufacturing and industries connected with coal are prominent. The good water power furnished by Beaver River is utilized in a number of manufacturing, chief of which are potteries, coffee mills, flour mills, wire, rivet, and nail factories, brick and sewer pipe works, twine factory, iron enameled bath tub works, fire-engine, keg, and brass casting works. There are about 1,000 employees in the manufacturing establishments. There are 10 churches, 12 public schools, and one parish school. It has the Beaver Valley General Hospital, a public art gallery and library, and a park. The three banks have a combined capital of \$1,150,000. The government is vested in a burgess and a council of 12 members. About three fourths of

NEW BRIGHTON--NEW BRUNSWICK

the population are native born Americans. Pop. (1910) 8,320.

New Brighton. See RICHMOND, BOWDOEN CO.

New Britain, brit'n, Conn., city, in Hartford County; on the New York, N. H. & H. railroad; about 11 miles southwest of Hartford. It was settled in 1687 and remained a part of Berlin until 1850 when it was incorporated as a town. In 1871 it was granted a city charter. It is in an agricultural region, but is noted for its extensive manufacturing interests. The chief manufactures are: stamped ware, hardware, foundry and machine-shop products, knit goods, hosiery, and cutlery. The trade is chiefly in the manufactured goods, but it is a distributing centre for quite a number of the nearby villages. It has a park, area, about 80 acres, well-kept streets, and a large number of fine church buildings. It is the seat of a State Normal School and the New Britain Institute; it has good public and parish schools.

The revised city charter of 1896 provides for a mayor, who holds office two years, and a council. Some of the administrative officials are appointed or elected by the mayor and council. The sheriff, city clerk and assistant, collector, treasurer, and auditor are elected by popular vote. The town elects the school board. The city owns and operates the waterworks. Elihu Burritt (q.v.) was born in New Britain and lived here nearly all his life. Pop. (1890) 16,519; (1900) 25,998; (1910) 43,916.

New Britain. See NEW POMERANIA.

New Brunswick, Canada, a maritime province, lying mainly between the 45th and 48th degrees of North Latitude and the 64th and 68th degrees of West Longitude. It is bounded on the south by the Bay of Fundy, on the east by the Straits of Northumberland and Gulf of Saint Lawrence, on the north by the Bay of Chaleur and the Province of Quebec, and on the west by the State of Maine. The length of the Province from north to south is 230 miles and its greatest breadth 190 miles; and it has an area of 27,885 square miles and a sea coast of about 600 miles.

Topographical Features.—Being a portion of the continent it resembles in its topographical features and climate the adjoining portions of Quebec and New England. It is a rolling country of no great elevation and its loftiest hills are in the northern and northwestern sections of the Province and are an extension of the Appalachian mountains. The scenery is picturesque and varied but a large portion of the centre of the Province consists of one vast forest.

The most marked feature of the eastern highlands of New Brunswick is a ridge of hills almost continuous from Maine to the Saint John river in Queens county, and eastward through Kings county ending in Butternut ridge. This ridge rises 800 or 900 feet above the surrounding country and includes some high peaks, Prospect mountain, and Eagle mountain near the Nerepis river, Mt. Pleasant, Mt. Porcupine and Red Rock mountain in Charlotte county, and Ben Lomond in the county of Saint John. This ridge runs parallel to the coast and is cut through in many places by rivers which

flow into the Bay of Fundy east of the Saint John river. There are also five parallel ridges running in an easterly direction and rising to an average of a thousand feet with valleys between. The highest of these ridges skirts the Bay of Fundy and contains Bloomsbury mountain and the Quaco hills. It divides into two or more ridges in Albert county, in Caledonia mountain and Shepody mountain, the latter being 1,050 feet high. The triangular area of sandstone of the carboniferous period presents a comparatively level surface nowhere rising above 800 feet, the general level especially in the eastern part of the Province being below 300 feet. The highest land of the Province is in the northern highlands. West of the Saint John river, in York and Carleton counties, it rises into several peaks and ridges to a height of 800 or 900 feet, while the general level is about 500 feet. East of the Saint John river the land rises to the watershed dividing the Tobique and other tributaries of the Saint John from the rivers which flow eastward. Mountains and broken ranges cross this tract of land in all directions and reach the Saint John valley in the vicinity of Mars hill, which is 1,688 feet in height.

The coast line of the Bay of Fundy is rocky and bold and indented with several fine harbors, the principal ones being Saint John, Letang, and Saint Andrews. On the Bay of Chaleur and Gulf of Saint Lawrence, the shore is less rugged and the harbors are not so deep.

Hydrography.—Few countries are so well watered as New Brunswick. Lakes are numerous and there are many rivers and streams, some of them of large size. The Saint John, which flows into the Bay of Fundy, is 450 miles in length and drains 26,000 square miles of territory. Some of its tributaries are upwards of 100 miles in length. Other large rivers are the Miramichi and Restigouche—which are each upwards of 200 miles in length—the Peticodiac and the Saint Croix.

Soil.—The Province presents a considerable diversity of soil. At its southern boundary there is a belt about 30 miles wide along the coast of the Bay of Fundy composed of granite and crystalline rocks, which are much disturbed and thrown up into ridges. North of this belt lies a large part of Sunbury, Westmorland, Albert and Northumberland counties, and the whole of the county of Kent. The western area of this limits is in York county, west of Oromocto lake, while its southern boundary extends to near the mouth of the Peticodiac river and the northern boundary goes as far as Bathurst. Northwest of this sandstone area the rocks are principally slate and limestone with large deposits of granite appearing in different places. These rocks are much disturbed and are thrown up at various angles forming high ridges and lofty peaks. The sandstones which occupy the middle and eastern part of the Province are the newest rocks in New Brunswick. They belong to what is called by geologists the carboniferous period, because deposits of coal are found in them. The rocks lie for the most part flat, or are spread out layer upon layer on the shores and bottoms of ponds and lakes in the form of clay, sand, and gravel, carried down by streams and rivers and hardened, after the lapse of ages, into solid rock.

NEW BRUNSWICK

Minerals.—New Brunswick is inferior to Nova Scotia in respect to mineral wealth, but it possesses some valuable ores and abounds in excellent stone. Coal is found in the southern portion of the Province at many points and is being worked at Grand Lake and in two or three places in the county of Kent. The seams are thin but close to the surface and easily reached. Albertite, which appears to be a form of petroleum, is found in the county of Albert and with it other substances termed bituminous, shale, and also petroleum. Wells of the latter are being operated in Westmorland. Iron is found in many portions of the Province and has been worked extensively in the county of Carleton. Copper ore exists in large quantities and has been worked in Westmorland county. Deposits of nickel, antimony, galena, manganese, and graphite also exist.

New Brunswick is abundantly supplied with limestone, the most valuable deposit being in the county of Saint John. Gypsum is found in large quantities and is extensively quarried in the county of Albert. There are large quarries of granite in various parts of New Brunswick, at Hamstead, in the Nerepis valley, and near Saint George in the county of Charlotte. Marble is also found in some localities. Freestone suitable for building purposes and for the manufacture of grindstones and millstones is also found in many parts of the Province. Slate is abundant and there is clay for the manufacture of bricks in most of the counties. Mineral springs are numerous, the principal ones being in the county of Kings. Salt springs are also found in the same county, and are now being operated with profit. The value of the mineral products of the Province, in 1900, is put down in the last census return at \$650,679.

Climate.—The climate, except on the coast of the Bay of Fundy, is similar to that of Quebec and Maine. The winters are severe and in summer a high temperature prevails, but the climate is healthy and there are no diseases peculiar to the soil. Winter begins early in December and lasts until the end of March. The most charming season is the autumn which lingers long. The cold weather does not become established until well on in November. The average rainfall is 30 inches and the average snowfall 88 inches. The total precipitation, rain and melted snow, averages 44 inches.

Animal Life.—There is no country in eastern America in which game is more abundant than it is in New Brunswick. There was a time in the history of the Province when, owing to unlawful methods of catching moose, they became scarce, but in recent years, under the protection afforded by the laws enacted by the Provincial government, moose are now abundant. The area of land, which is seldom trodden by human feet in the interior of the Province, is so large that moose find there a splendid haunt, and the same is true with respect to other wild animals.

The caribou, which is a smaller animal than the moose and is allied to the reindeer of northern Europe, is also abundant in New Brunswick. Deer are so plentiful as to have become almost a nuisance and their numbers continue to increase.

New Brunswick has a large number of fur

bearing animals, among which are the bear, the raccoon, the wolverine, the marten, the mink, the otter, the lynx, the muskrat, the woodchuck, the fisher, and the squirrel. The hare is also found in great numbers all over the Province. This animal turns white in winter.

Wild geese are abundant and there are no less than six species of wild ducks besides brant. The great haunts of wild geese and of brant are on the north shore, but wild ducks are to be found on the rivers all over the Province. There are two species of partridge, although the proper designation of this bird is grouse. Curlew, plover, snipe, and woodchuck are also abundant and afford admirable sport. The great northern diver or loon is to be found in all the great rivers. In addition to these, there are two species of eagle, five species of hawks, and four or five varieties of owls. These are but a few of the birds of New Brunswick of which there are about 200 species in all. The Government possesses a splendid collection of them, which can be seen at Fredericton.

New Brunswick is pre-eminently the land of the angler, for nearly all its great rivers abound in game fish. The salmon, the king of sporting fish, frequents all the tributaries of the Saint John below Grand Falls, such rivers as the Tobique being famed for that fish. Salmon also are found in all the rivers of the North Shore. The Nepisiguit, the Restigouche, and the Miramichi have a world-wide reputation as angling rivers. All the lakes of the Province swarm with trout and furnish admirable fishing in their season. There is hardly a stream in the Province in which trout are not to be found, and some of the rivers, such as the Tabusintac, are widely famed for the enormous numbers of fish which have been taken in them by sportsmen. Sea trout of large size swarm in all the rivers which flow into the Gulf of Saint Lawrence in the early summer. In addition to these game fish, other species, which are esteemed in Europe but attract little attention on this side of the Atlantic, such as chub and perch, are very abundant. Pickerel are also to be found in many rivers as well as eels, which frequently attain a large size.

Agriculture.—The leading industry of New Brunswick is agriculture, as the greater portion of its people are farmers. The Province contains much excellent land, the marshes at the head of the Bay of Fundy, the intervals of the Saint John and other large rivers, and the uplands of the northern portion of the Province being very fertile. Wheat is grown successfully in many districts but not in sufficient quantities to supply the needs of the Province. The largest crops are oats, potatoes, turnips, and buckwheat, all of which yield well. A great deal of attention is now being given to dairying. There are numerous cheese factories and creameries in the Province which export their products to England and other countries. The government has a department of agriculture which attends to the needs of that important industry.

According to the census of 1901, the Province had in 1900 897,417 acres under crop, the product being 381,699 bushels of wheat, 99,050 of barley, 4,816,173 of oats, 1,300,855 of buckwheat, 4,649,059 of potatoes, 2,070,486 of field roots, and 512,548 tons of hay. The live stock consisted

NEW BRUNSWICK

of 61,789 horses, 111,084 milch cows, 116,112 other horned cattle 182,521 sheep, and 51,763 swine. The value of the agricultural property was \$51,338,311, of which \$22,329,482 was in land, \$16,379,456 in buildings, and \$12,629,373 in live stock. The value of the agricultural products for that year was \$12,873,480. The principal crops for 1905 were 404,897 bushels of wheat, 5,486,528 bushels of oats, 1,157,237 bushels of buckwheat, 5,518,732 bushels of potatoes and 2,645,401 bushels of turnips.

Lumbering.—The larger portion of the Province is still covered by forests and lumbering is, after agriculture, the principal industry. This business is carried on on a large scale by operators, some of whom own the land upon which they cut their lumber, while others lumber on lands which they lease from the Provincial government which still owns upwards of 10,000 square miles of forest. The principal commercial wood is the spruce, which is sawn into deals and sent to England and the United States. Pine, which formerly abounded, is now scarce. The other forest trees of commercial value are fir, hemlock, maple, oak, elm, birch, beech, ash, butternut, poplar, and hemlock. The forests exports of New Brunswick amount to about \$3,000,000 a year of which three-fourths goes to Great Britain. The abundance of wood of all kinds in New Brunswick at one time made it a great shipbuilding country and the ships of the Province were known all over the world. This business has been destroyed by the introduction of steel ships and steamships and the only shipbuilding now done in the Province is the construction of small vessels for the coasting trade. The forests of New Brunswick are a large source of revenue to the Government, the amount received for timber licenses and stumpage being in the vicinity of \$300,000 a year.

The principal lumbering rivers of the Province are the Saint John, Saint Croix, Restigouche, and Miramichi and their tributaries. All the rivers of New Brunswick, of any size, contribute something to the lumbering industry.

Sea Fisheries.—New Brunswick possesses a coast line on the Bay of Fundy, Gulf of Saint Lawrence, and Bay of Chaleur of upwards of 600 miles and these waters abound in fish. Although less extensive than the fisheries of Nova Scotia, those of New Brunswick are very valuable, the average product being about four and a half million dollars a year. The two greatest fishing countries are Charlotte and Gloucester, but Westmorland, Northumberland, Kent, and Saint John are also well to the front. The value of the fish caught in the Province in 1905 was \$4,671,084. The values of the chief kinds of fish caught were as follows:—Herring, \$1,033,539; sardines, \$788,830; lobsters, \$651,755; cod, \$430,830; smelts, \$346,970; salmon, \$256,145; shellfish, \$164,357; bait, \$181,275; alewives, \$99,632; hake, \$88,571; haddock, \$83,694; rock cod, \$82,950.

Manufacturers.—The great manufacturing industry of New Brunswick is the conversion of the lumber of the Province into deals, boards, clapboards, shingles, and similar articles. This industry employs hundreds of saw mills and gives employment to many thousands of men. The Province contains four pulp mills, for the

making of chemical pulp. There are five cotton factories in New Brunswick and several iron foundries. The manufacture of nails is carried on extensively. Boots and shoes are made in a number of places, as are wrappers, paper boxes, woollen cloths, candy, and soap. There are also several furniture factories and carriage factories.

Revenue.—The revenue of the Province is mainly derived from subsidies received from the Dominion Government and also from the receipts of the Crown Land Office. There is also a revenue from liquor licenses, succession duties, taxes on incorporated companies, fees of office, and other sources, the whole amounting to about \$900,000 a year. The Province expends yearly about \$215,000 on education, \$225,000 on public works, \$30,000 on agriculture, \$15,000 on game protection, \$60,000 on the Provincial Hospital for Nervous Diseases, and \$60,000 on the Legislature and Executive Government. The debt of the Province, amounting to \$3,500,000, has been largely expended on subsidies to lines of railway, the construction of permanent steel bridges for the highways, and similar services. No direct taxes are levied on the individual by the Provincial government.

Education.—The educational system of the Province is based on the theory that the property of the community should support the schools which are free and undenominational. The number of pupils attending the schools is upwards of 60,000. There is a normal school at Fredericton for the education of teachers. Besides the common schools there are superior schools and grammar schools in each county and the cities have high schools which take the pupils to the threshold of the University. The University of New Brunswick, located at Fredericton, is maintained by an endowment granted by the Province and is an efficient institution. There are also two denominational Universities, Mount Allison at Sackville, maintained by the Methodists, and Saint Joseph at Memramcook, maintained by the Roman Catholics. Consolidated schools which are formed by the conjunction of three or more school districts are also being established in several counties.

Religion.—There is no State church in New Brunswick, all denominations being on an equal footing. The largest religious body is the Roman Catholic which, at the census of 1901, numbered 125,698. The Baptists come next, numbering 80,874. The adherents of the Church of England number 41,767, Presbyterians 39,496, Methodists 35,504.

Government.—The system of government in New Brunswick is based on that of Great Britain, except that there is but one legislative body of 48 members, the Upper House having been abolished in 1892. Every male resident is a voter and responsible government prevails to the fullest extent. The Lieutenant-Governor is appointed by the Government of Canada, but all power rests in the Executive Council which depends for its existence on having a majority in the Legislature. Of the seven members of the Executive Council six are heads of Departments. The term of the Legislature is five years but it may be dissolved at any time by the Lieutenant-Governor.

New Brunswick is divided into 15 coun-

NEW BRUNSWICK—NEW CAANAN

ties each of which is a municipality and is governed by a body elected by the taxpayers which is known as the Municipal Council and which contains representatives from each parish. Each county is divided into parishes and the Parish Officers are appointed by the Municipal Council. There are also three incorporated cities in the Province and a large number of incorporated towns, almost every small town having now a municipal government of its own.

Means of Communication.—New Brunswick contains about 1,500 miles of railway, the principal lines being the Intercolonial, which is owned by the Government of Canada, and the Canadian Pacific. Moncton is the centre of the Intercolonial Railway system, and that line connects Saint John, Fredericton, Chatham, and other important New Brunswick towns with Quebec and Montreal. The construction of the Intercolonial Railway was one of the terms upon which the Maritime Provinces agreed to enter confederation in 1867. The Canadian Pacific Railway has its Atlantic terminus at Saint John and it connects that city as well as Fredericton, Woodstock, Saint Andrews, and Saint Stephen with Moncton and the west. A large portion of the winter traffic of Canada and of the State of Minnesota passes over its road, through New Brunswick to the port of Saint John where there are deep water wharves and elevators. Seven or eight lines of steamships run between Saint John and Great Britain during the winter. The highway roads of the Province have a total length of upwards of 12,000 miles and are well kept up by the Department of Public Works. The bridges number upwards of 4,000.

Cities and Towns.—New Brunswick contains three cities and a number of towns which are rising into importance. The largest of these is Saint John (q.v.), situated at the mouth of the river of that name. It is a large shipping port and lines of steamships run from it in winter to Great Britain, carrying the produce of western Canada to European markets. It has railway connection with the west by means of the Canadian Pacific and Intercolonial Railways. Saint John is also a considerable manufacturing centre. Its population is about 50,000.

Fredericton, with a population of 8,000, situated 84 miles up the Saint John river, is the capital of the Province. It is the centre of an important agricultural district and the seat of some manufacturing industries. Moncton, which has upwards of 10,000 inhabitants, is the headquarters of the Intercolonial Railway System and also manufactures to a considerable extent.

Chatham, at the mouth of the Miramichi river, is an important port for the shipment of lumber to Europe. Among the other towns of the Province that are worthy of mention are Saint Stephen, Saint Andrews, Woodstock, Edmundston, Sussex, Dorchester, Sackville, Richibucto, Shediac, Newcastle, Dalhousie, Hillsborough, and Campbellton.

History.—New Brunswick was a part of the French Province of Acadia and after the downfall of French power it was a part of Nova Scotia until the year 1784. Fort LaTour, at the entrance of the Saint John river, was the scene of the contests between LaTour and Charnissay

for the mastery of Acadia and of the heroic deeds of Lady LaTour. It was captured and destroyed in 1645. Fort Beausejour, at the head of Chignecto Bay, a stronghold of the French, was taken by the English in 1755. At the close of the War of the Revolution many loyalists who had taken the side of the King in the contest came to New Brunswick and a number of the Loyalist regiments were disbanded in the Province where their descendants still live. After the close of the Napoleonic wars and again after the Irish famine of 1847 large numbers of immigrants came to the Province. About 80,000 of the inhabitants are of French origin, descendants of the Acadians who settled in the country in 1634. The others are of the British races, the English predominating. The population of the Province in 1901 was 331,120.

JAMES HANNAY,

Author of 'New Brunswick. Its Resources and Advantages.'

New Brunswick, brūnz'wīk, N. J., city, county-seat of Middlesex County; on the Raritan River, the Delaware and Raritan Canal; and on the Raritan R., and the Pennsylvania R.R.'s; about 25 miles north by east of Trenton, 30 miles west by south of New York, and 15 miles from the mouth of the river. It was settled in 1681, and until 1697 it was called "Prigmore's Swamp." The name was changed to "Inion's Ferry," and in 1714 it was again changed and called New Brunswick after the House of Brunswick. In 1730 it was granted a royal charter; in 1736 it was incorporated as a town, and in 1784 was chartered as a city. It was the scene of much of the trouble during the Revolutionary War; it was occupied by the British the winter of 1776-7.

It is a manufacturing city, and has considerable trade, as it has good shipping facilities by land and water. The chief manufacturing establishments are cigar factories which have about 1,400 employees; rubber works, 1,000 employees; wall-paper factory, 500 employees; and a large number of smaller works, all of which are prospering. It is the seat of Rutgers College (q.v.), the State Agricultural and Mechanical College (q.v.), and Saint Agnes' Academy. The Theological Seminary of the Dutch Reformed Church is connected with Rutgers. It has seven public schools, three parish schools, the Gardner A. Sage library which contains about 45,000 volumes, and the public library with about 18,000 volumes. The Saint Mary's Orphan Asylum and Home for the Aged is in charge of Sisters of Saint Francis.

The government is administered under the charter of 1863 and is vested in a mayor, who holds office two years, and a council of 13 members. The mayor appoints the board of health and the library trustees; the council elects the water commissioners; the board of education is elected by the people. The city owns and operates the waterworks. Pop. (1890) 18,603; (1900) 20,006; (1910) 23,388.

New Caanan, ká'nán, Conn., town in Fairfield County; on the New York, New Haven & Hartford railroad; eight miles northeast of Stamford and six miles northwest of Norwalk. It is a beautiful residential town and a favorite summer resort for New York business men.

NEW CALEDONIA—NEW CONNECTION METHODISTS

The surface is hilly, the altitude about 400 feet, and the climate cool in summer and temperate in winter. The hard well-kept roads extend into the country and to the beaches on the Sound. It has some manufacturing establishments, chief of which are clothing, boot and shoe factories, and cigar factories. It has a public library and reading room. Pop. (1890) 2,701; (1900) 2,668; (1910) 3,667.

New Caledonia, or *Nouvelle Calédonie*, *noo-vél ká-lá-dô-né*, an island and penal colony belonging to France, in the Pacific Ocean, lying between the parallel of 20° S. and the Tropic of Capricorn, about 700 miles east of Australia. Its length northwest to southeast is 250 miles, the breadth being about 35 miles. The area is 8,100 square miles. It is surrounded by coral reefs, at a distance of from five to 18 miles. It was discovered by Cook in his second voyage (1774). Two parallel ranges of mountains extend through the island, attaining in the north a height of 5,570 feet. The soil is fertile, and the island produces the bread-fruit tree, banana, sugarcane, arum, cocoa, and excellent timber. The climate is healthful. Iron, copper, cobalt, nickel, silver, mercury, antimony, and gold have been discovered in recent years, and the nickel mines are now an important source of this metal. Coal is also found in abundance. The animals are very few, mammals and reptiles being specially deficient. The Melanesian natives, known as *Kanakas*, were formerly given to cannibalism. They are mainly Papuan in character, and are grouped in tribes, each with its own chief. In the irrigation and tillage of the soil they show no small skill. The Catholic mission, which has numerous stations, has made many converts. The aborigines sometimes engage as laborers under the Europeans, and natives of the neighboring islands are also introduced for the sake of their labor. The chief crops of the island are maize and taro; and among the other objects of cultivation are rice, wheat, sugarcane, coffee, cotton, coconuts, etc. The imports, largely for the convict stations, are wines and spirits, flour, vegetables, etc.; and the exports include nickel, preserved meat, chrome and other ores, etc. New Caledonia was taken possession of by the French on 24 Sept. 1853, and a small colony was formed there. During the time of the Second Empire it was employed as a place of banishment for criminals, a purpose which it still serves. The dependencies of the island are the Isle of Pines, the Loyalty Islands, the Huon Islands, the Chesterfield Islands, and the Wallis Archipelago. The whole of this territory is under a governor, advised by a council-general, and is divided into five *arrondissements*, of which four are ruled by administrators, whilst the fifth, *Nouméa*, is directly under the governor. The government of the island is essentially military, and the frequent escape of convicts (sometimes unwelcome visitors to Australia) has rendered the authorities very strict. The convicts are grouped in five classes, of which two have contributed much to the improvement of the colony by the construction of roads, etc., whilst a third is virtually free. A railway now connects *Nouméa* with *Kanala*. The capital, and only important town, is *Nouméa*, formerly called *Port-de-France*, with a pop. (1901) 6,668. It lies in a small mountainous peninsula on an excellent bay of the same name. The last census

population was 51,415, of whom 12,253 were European civilians, 10,056 undergoing punishment, and 29,106 natives. Consult Griffith, 'In an Unknown Prison Land' (1901).

New Caledonia, North America, a former name for a region west of the Rocky Mountains, 500 miles long from north to south, and 400 from east to west, now included in British Columbia.

New Castle, *kā-tē'*, Spain, an ancient province, corresponding to the old kingdom of Toledo, and now forming the provinces of Madrid, Ciudad-Real, Cuenca, Guadalajara, and Toledo, occupying nearly the centre of the peninsula; it had an area of 28,010 square miles, and the population of the region in 1910 was 2,000,000. With the province of Old Castile which bounded it on the north, and is now divided into the provinces Avila, Burgos, Logroño, Palencia, Santander, Segovia, Soria, and Valladolid, area, 25,490 square miles, pop. about 1,900,000. New Castile formed the kingdom of Castile which was instrumental in expelling the Moors from Spain (q.v.).

New Church. See *SWENHOBORGIAN*.

New-chwang, *nē-chwāng'*. See *NIU-CHUANG*.

New College, Oxford, England, was founded in 1379 by William of Wykeham, bishop of Winchester and lord-chancellor of England, as the College of Saint Mary of Winchester, the scholars to be recruited from the most promising pupils of the great public school of Winchester (q.v.). Its original establishment comprised a warden, 70 fellows and scholars, 10 chaplains, three clerics, and 16 choristers; its modern establishment comprises a warden, 22 fellows, three chaplains, 40 scholars, a choir, and an average of nearly 300 graduates. Forty church presentations are within its gifts. The college buildings are among the finest in Oxford, and originated the style of English college architecture; the chief features are the hall, the chapel, and the gardens. Among celebrities associated with the college are Vitelli, Grocyn, Archbishop Chichele, Bishops Waynflete, Lowth, Ken, and Sydney Smith.

New Comerstown, *kūm'érz-town*, Ohio, city, in Tuscarawas County; on the Tuscarawas River, and on the Pennsylvania and the Pittsburg, C., C. & St. L. R.R.'s; about 80 miles east by north of Columbus. It is in a fertile agricultural region, near bituminous and clay deposits. The chief manufactures are lumber and planing mill products, cigars, brick, and dairy products. Pop. (1890) 1,251; (1900) 2,699; (1910) 2,943.

New Connection of General Baptists, an orthodox body protesting against the growing Arianism and Socinianism of the English Baptist Church dating from 1770 and led by Dan Taylor (1738-1816), a Cornish miner.

New Connection Methodists, the first secession from the English Wesleys, dating from 1797. The New Connection comprised the followers of Alexander Kilham (hence sometimes called *KILHAMITES*), who in 1795 published 'The Progress of Liberty,' a criticism of the lax church discipline of the day, for which he was expelled from the Conference a year later. In 1797 three other ministers joined him.

NEW CREEK—NEW ENGLAND ORDER OF PROTECTION

The church government of the New Connection gives laymen equal authority with the clergy in Conference. With but a few congregations in Ireland and in Canada the body is not growing and in 1890 numbered about 35,000 members.

New Creek (Keyser), Engagements at. While Gen. J. E. Johnston was at Winchester, Va., 14 June 1861, he heard that Col. Lew Wallace, with the 11th Indiana regiment, had marched from Cumberland, Md., and driven a Confederate force from Romney. Believing it to be the advance of McClellan's column from West Virginia, Johnston ordered Col. A. P. Hill, with three regiments, to march on Romney, 45 miles west, drive out Wallace, and destroy the bridges on the Baltimore & Ohio Railroad west of Cumberland. Hill reached Romney, but Wallace had fallen back to Cumberland. At night of the 18th Hill sent Col. Vaughn, with four companies of infantry, to destroy the bridge of the Baltimore & Ohio Railroad over New Creek, guarded by about 200 local militia and two guns. Vaughn crossed the north branch of the Potomac, beyond which the Union troops had taken position, and put them to flight, captured the two guns and a set of colors, burned the bridge over the mouth of New Creek, and then pushed on to Piedmont, five miles westward, destroyed parts of the railroad and cut the telegraph wires, and then returned to Winchester. Later the position at New Creek was fortified and garrisoned to protect the railroad bridge. On 4 Aug. 1864 it was held by Col. Robert Stevenson of the 154th regiment Ohio National Guard with his regiment, small detachments of three other regiments, and eight guns, in all about 1,500 men. During the day Stevenson was attacked by Gen. John McCausland, who, returning from his raid on Chambersburg, had approached by way of Romney. After a severe fight of several hours McCausland withdrew toward Moorefield, leaving several dead and severely wounded on the field. The Union loss was 8 killed, 29 wounded and missing. On 27 Nov. 1864 New Creek was held by Col. Latham, 5th West Virginia cavalry, with about 700 dismounted cavalry, four heavy guns, and three field pieces. On the morning of the 27th Gen. Rosser with two brigades of cavalry, his own and Payne's, crossed Great North Mountain into Hardy County, surprised and captured Latham's pickets, charged over his works, and captured his artillery and most of his command with but slight resistance. The prisoners taken numbered about 500, and with them their arms and some colors. Four of the seven guns, being heavy pieces, were spiked and left, the carriages being burned. All the government buildings, containing a large amount of ordnance, quartermaster and commissary stores, and 200 wagons, were burned, and Rosser marched away with his prisoners, three guns, about 250 horses, also several hundred head of cattle and a large number of sheep collected from the farms of Hardy and Hampshire Counties. E. A. CARMAN.

New Cumberland, W. Va., town, county-seat of Hancock County; on the Ohio River, and the Pittsburg, C. C. & St. L. railroad; about 35 miles north of Wheeling. In the vicinity are coal mines and valuable clay beds.

The chief manufactures are sewer pipe, tile, a semi-porcelain pottery, fire and paving brick, foundry products, and machinery. It has large mills where the fire clay, for use in the iron works, is pulverized. It has an extensive trade in coal and clay products. Pop. (1910) 1,807.

New Decatur, de-ká'tér, Ala., city, in Morgan County; near the Tennessee River, and on the Memphis & C., and the Louisville & N. R.R.'s; about two miles south of Decatur and 85 miles north by west of Birmingham. The first settlement was made in 1887, and in 1889 it was incorporated. It is an agricultural, lumbering, and manufacturing section of the State. Its industrial interests are connected with the manufacturing and shipping of iron products, lumbering and farm products. It has a good trade in wool. Pop. (1910) 6,118.

New England, a collective term applied to the northeastern portion of the United States, comprising the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut. It extends from lat. 41° to 48° N., and from lon. 67° to 74° W., with an aggregate area of 65,000 square miles. It has a coast line of about 700 miles, without allowing for the smaller inlets, and constitutes a large part of the great peninsula which, including Nova Scotia, New Brunswick, and parts of Lower Canada, is formed by the Atlantic Ocean, the St. Lawrence, and the connected waters of Lakes Champlain and George and the river Hudson. It was originally granted for colonization by James I. in 1606 to the Plymouth company under the name of North Virginia, and received its present name from Capt. John Smith, who in 1614 explored and made a map of the coast. For the details of the geography and history of New England, see the States respectively of which it is composed. Consult Palfrey, 'History of New England.'

New England, A Compendious History of, by John Gorham Palfrey (q.v.). It covers the time from the first discovery of New England by Europeans down to the first general Congress of the Anglo-American colonies in 1765, with a supplementary chapter giving a summary of the events of the last ten years of colonial dependence, and was published 1865-73.

New England Emigrant Company, The, in American history, a corporation organized at Boston in 1855 to control emigration to the Territory of Kansas in the interest of the anti-slavery party. The Emigrant Company aided largely in making Kansas a free State.

New England Historic and Genealogical Society, The, an association organized in Boston, Mass., in 1845 for historical research and the preserving of early New England records. A quarterly magazine, 'The New England Historical and Genealogical Register,' was begun in 1847 and the society also publishes the 'Bibliopolist' for circulation among its members. The library of the society contained in 1903 over 32,000 volumes.

New England Order of Protection, an American fraternal and beneficial Society organized in 1887. In 1903 it had 6 grand lodges, 335 sub lodges and 31,584 members. In 1902 it disbursed \$485,000 in benefits, and over \$3,000,000 since its organization.

NEW ENGLAND PRIMER—NEW GUINEA

New England Primer, a famous educational work, compiled by one Benjamin Harris, an English versifier and printer, who established a nondescript shop in Boston during the reign of James II. He first published 'The Protestant Tutor,' and before 1690 the 'New England Primer' as an abridgment of the earlier work. It is thought that in the 18th century about 2,000,000 copies were sold, yet of these less than 50 are known to be extant. These surviving copies represent about 40 editions. Only a small portion of the supposed 1st edition is in existence, this so-called 'Bradford Fragment' having been discovered as waste in the binding of a later work. The contents of the 'Primer' was variously altered in accommodation to religious and political changes. The alphabet rimes, with wood-cuts crude as themselves, are probably the best-known feature. One of the most curious of these illustrations shows Job liberally covered with spots. The shorter Westminster catechism is also included. P. L. Ford (q.v.) did much to clear up the subject of the 'Primer' by his historical and bibliographical study, 'The New England Primer: A History of its Origin and Development, with a Reprint of the Unique Copy of the Earliest Known Edition' (1897).

New England Shilling, the name given to the first American colonial coins issued in 1652. They were of the value of "12d, 6d and 3d peeces," stamped N E on the face and XII, VI or III on the reverse to denote the value. See NUMISMATICS.

New England Theology, a Calvinistic school of theology, originated in New England by Jonathan Edwards (see EDWARDS, JONATHAN). This school was controversially opposed to Arminianism (q.v.). A new element was introduced into the theological atmosphere of New England by the preaching of Universalism (q.v.) by John Murray 1770. The controversies of the early 19th century resulted in the crystallization of New England Theology into a complete system, comprising the tenets, that sin is voluntary; that depravity is inherited from Adam; that repentance or turning to God can only result from preventing grace; that man has complete freedom of will; that holiness consists in unselfish love; that certain persons are predestined to receive the grace of God which leads to repentance. Modern philosophy and criticism have dissolved the dogmatism of this theology which is no longer taught in an unmodified form in Congregational seminaries. Consult: Walker, 'History of the Congregational Churches in the United States' (1894); Boardman, 'New England Theology' (1899).

New Essays: Observations, Divine and Moral, collected out of the Holy Scriptures, Ancient and Modern Writers, both Divine and Human; as also out of the Great Volume of Men's Manners: tending to the furtherance of Knowledge and Virtue. By John Robinson (q.v.) (1624). A volume of 62 essays, on the plan of Bacon's, but at greater length, and in ethical, religious, and human interest more like Emerson's 'Essays' in our own time: the work of an English clergyman and scholar, in exile at Leyden in Holland, under whose ministry and through whose counsel the Pilgrim Fathers de-

veloped religious liberalism and executed the earliest planting of New England.

New Forest, England, a public pleasure ground in the southwest of Hampshire, bordering on the Solent and English Channel, and bounded northeast by Southampton Water, and west by the river Avon. It measures 14 by 16 miles, is about 60 miles in circuit, and has an extreme area of 144 square miles. Its name dates from 1079 when William the Conqueror made a "mickle deer-frith," in so doing destroying several hamlets. This afforestation, enforced by the savage "Forest Laws" was regarded as an act of the greatest cruelty, and the violent deaths in the forest of his sons Richard and William Rufus, were looked upon as special judgments. Oak and beech are the principal trees; the deer were removed in 1851. The forest is under the supervision of the Court of Verderers since 1877; it gives its name to a county parliamentary division. There are several villages within its limits, Lyndhurst being the forest capital.

New France, or *La Nouvelle France*, *la nou-vêl frâns*, the original name given to Canada (q.v.) by the earliest settlers, who were Frenchmen.

New Glasgow, *gîs'gô* or *-kô*, Canada, town of Pictou County, Nova Scotia; on the East River near its entrance into Pictou Harbor, and on the Intercolonial Railway, 104 miles northeast of Halifax, 8 miles south of Pictou, on the Northumberland Strait. In the vicinity are rich deposits of coal and iron, which contribute to make it an important centre for the manufacture of iron and steel. It also has large ship-building yards, foundries, machine shops, tanneries, glass and pottery works, and a considerable trade in coal, iron ore, and manufactured articles; good schools, churches, etc. Pop. about 5,000.

New Granada, *grâ-nâ'da*, the name by which the republic now called Colombia (q.v.), was known for many years after its settlement by people from Granada, Spain.

New Guinea, *gîn'i*, or *Papua*, *pâp'oo-â* or *pâ'poo-â*, Australasia, a large island of the Melanesian region, the western and larger portion of which belongs to the Netherlands, while the eastern portion is divided into northern and southern sections, belonging respectively to Germany and Great Britain. The island, which after Australia and Greenland ranks third among the largest islands of the world, lies on the southwestern side of the Pacific Ocean, between lat. 0° 10' and 10° 42' S, and lon. 130° 57' and 150° 52' E. Its length is about 1,490 miles; maximum breadth, 410 miles; estimated area, over 312,000 square miles. It is separated from Australia (Queensland) on the south by Torres Strait, from the northern territory of South Australia by the Arafura Sea, and from the Moluccas on the west by Gilolo Passage. The island has a somewhat irregular form, but it may be described as consisting of a broad central portion from which proceed two narrower peninsulas, one in the northwest and the other in the southeast. The coasts are mostly lofty, but in the neighborhood of Torres Strait and to the west the shore presents the appearance of a marshy flat, covered with dense forests. The outline is broken by many indentations,

NEW CREEK—NEW ENGLAND ORDER OF PROTECTION

The church government of the New Connection gives laymen equal authority with the clergy in Conference. With but a few congregations in Ireland and in Canada the body is not growing and in 1890 numbered about 35,000 members.

New Creek (Keyser), Engagements at
While Gen. J. E. Johnston was at Winchester, Va., 14 June 1861, he heard that Col. I. Wallace, with the 11th Indiana regiment, had marched from Cumberland, Md., and driven a Confederate force from Romney. Believing to be the advance of McClellan's column into West Virginia, Johnston ordered Col. Hill, with three regiments, to march to Romney, 45 miles west, drive out Wallace, destroy the bridges on the Baltimore and Ohio Railroad west of Cumberland. Col. Hill, but Wallace had fallen back to Cumberland. At night of the 18th Hill, with four companies of the 11th Indiana, destroyed the bridge of the Baltimore and Ohio Railroad over New Creek, guarding the north branch of the Potomac, which the Union troops had captured and put them to flight, captured a set of colors, burned the mouth of New Creek, and moved to Piedmont, five miles west of the railroad and cut it, and then returned to W. position at New Creek. Prisoners were taken to protect the railroad. Aug. 1864 it was held by the 154th regiment of the 1st division, with his regiment, and other regiments, about 1,500 men. During the attack by Gen. Turner, turning from his position, approached by a force of seven regiments toward Moore's position, severely wounded, loss was 800 men. On 27 Nov. 1864, Latham, with 700 dismounted men, three companies of Gen. I. Johnston's own, and a battery of artillery, were working his position, and the soldiers were sent to the rear.

among the chief being the Gulf of Papua and M'Cluer Inlet on the southern side, and Great Geelvink Bay, Astrolabe Bay, and Huon Gulf on the northern side. Many islands, large and small, lie off the coast, chief of which are those of the Bismarck Archipelago (q.v.) belonging to Germany off Kaiser Wilhelm Land, the north-eastern section of New Guinea.

In the southeast of the island the mountain ranges rise in Owen Stanley to a height of 13,205 feet; farther west and near the north coast Mount Schopenhauer reaches 20,000 feet; in the eastern continuation of the Charles Louis Range in Dutch New Guinea, as yet unexplored, there are still loftier mountains, covered with perpetual snow, and volcanoes. The chief rivers are the Fly, in British territory, with its tributary the Strickland; the Kaiserin Augusta, in German territory; and the Amberno, in Dutch territory, with a large delta. New Guinea has few indigenous mammals, and all these, with the exception of a species of pig and some mice, are marsupials and monotremes. It abounds in birds, among which are immense flocks of parrots, pigeons, and kingfishers, and the celebrated birds of paradise. There are also several remarkable species of bower-birds, belonging to the genus *Amblyornis*. The forests abound in enormous trees, including the camphor-tree; and bananas, coconuts, sago, sugarcanes, rice, maize, and yams, are cultivated by the natives. On the west coast there are numerous Malay settlements, but the bulk of the inhabitants is composed of Papuans, a race resembling the negroes of Guinea. They are divided into numerous tribes chiefly in a neolithic stage of civilization, some of whom are of a friendly disposition, while others are fierce and untractable, but gradually improving under Europeanizing and missionary influence.

The discovery of New Guinea is said to have been made by Abreu in 1511, but the first navigator who is known to have visited the island was another Portuguese, Jorge de Meneses, who touched on it in 1526. The present name was given to the island by the Spaniard Ynigo Ortiz de Retez, who sailed along its north coast in 1546. From the beginning of the 17th century much exploring work was done by the Dutch, especially along the west and south coasts of what is now Dutch New Guinea. Dampier in 1700 added to our knowledge of the south coast, and discovered Dampier Strait. In 1827 the Dutch formed a settlement at Triton Bay, but they soon abandoned it. The southeast coast was surveyed between 1845 and 1850 by Captain Owen Stanley, and 1873 Captain Moresby ascertained the exact form of the southeastern extremity. The naturalists were the first to make incursions into its interior, and among these Dr. A. R. Wallace, who visited it in 1858, was the pioneer. The missionaries came next, and mission stations formed by Germans are maintained on the northeast coast, and by the London Missionary Society at various points on the southeast coast. Germany, and the Australian colonies also, began to take an interest in New Guinea, and the latter urged the British Government to annex the east part of the island, the west portion having long been recognized as Dutch. The delimitation and division of the island between Great Britain, Germany and Holland was settled in 1885. That part of the island

lying west of the 141st meridian was assigned to Holland, and comprises 151,789 square miles; the north part of the rest of the island is assigned to Germany, and the south to Great Britain. The Germany territory, called Kaiser Wilhelm's Land, contains about 70,000 square miles; the English territory, 90,540 square miles.

The government of the British portion is in the hands of an administrator appointed by the crown, assisted by an executive and a legislative council. New South Wales, Victoria, and Queensland each contribute to the expense of the government. Land cannot be purchased except from the administrator. The deportation of the natives is forbidden, as is also the sale to them of firearms, intoxicating spirits, or opium. The official centre is Port Moresby. The islands of Torres Strait, which are the seat of a valuable pearl-shell and trepang fishery, and which practically command the strait, have all been annexed to Queensland. A German chartered company whose object is to develop the resources of the country has stations in German New Guinea, where also the sale of firearms, gunpowder, and spirits is forbidden. The Dutch have done little or nothing for their portion of the island. The population of the Dutch portion is estimated at 200,000; of the German, 110,000; of the British, 350,000; total, 660,000. Consult: Chalmers, 'Pioneer Life and Work in New Guinea' (1895); Cooke, 'Australian Defences and New Guinea' (1887); Haddon, 'Decorative Art of British New Guinea' (1894); MacGregor, 'British New Guinea' (1897); Romilly, 'The Western Pacific and New Guinea' (1887); Webster, 'Through New Guinea' (1889).

New Hampshire, hāmp'shīr, one of the New England States, is named from Hampshire in England, the title being first applied in 1639. It is also locally and popularly known as the "Granite State."

Physical Conditions.—The most northerly of the 13 original colonies, New Hampshire lies 70° 37' and 73° 37' longitude west from Greenwich, and between 42° 40' and 45° 18' 23" north latitude. In general outline its outline is that of a scalene, almost a right-angled triangle, with a north and south perpendicular of 180 miles. The extreme width near the southern boundary is 100 miles. The State is bounded on the north by the Province of Quebec, on the east by the State of Maine, on the southeast by the Atlantic Ocean and Essex County, Mass., on the south by the State of Massachusetts, on the west and northwest chiefly by the State of Vermont and partly by the Province of Quebec. Within these bounds is included an area of 9,336 square miles of greatly diversified country, comprising sea coast, lakes, rivers, mountain ranges, forests and tillable land. The surface contour is in general rugged and picturesque. By reason of latitude, ocean proximity, high mountains and narrow valleys the climate conditions present great variety. The mean average temperature of the northern portion for the year is 41; for the winter 17; for the summer 65; of the southern part the mean average for the year is 45; for the winter 23; for the summer 66.5. The average precipitation is nearly 40 inches per year, quite evenly distributed both as to area and period. There are five distinct water-shed areas, drained by the Connecticut, Merrimac, Androscoggin,

NEW HAMPSHIRE

Saco and Piscataqua rivers and their numerous tributaries. These streams contribute materially to the economic resources of the State through their abundant water power, and to the fertility of their valleys. The mountain district comprises 1,270 square miles, the culminating point of which is Mount Washington, 6,270 feet high. This area is divided into two nearly equal divisions by the deep and contiguous valleys of the Saco and the Ammonoosuc, and these in turn are subdivided into several smaller groups. Winnepesaukee, situated in Belknap and Carroll counties, is the largest lake, having an area of 70 square miles, exclusive of islands, of which it contains 264. Other important lakes in order of their size are Umbagog, 18 square miles; Squam, 15.6, and Sunapee, 11.2.

Settlement.—The first description of any of the region now included within the State of New Hampshire was given by Captain John Smith, who skirted the New England coast in 1614, from Penobscot Bay to Cape Cod, and discovered the Piscataqua River and the adjacent harbor, although the coast is said to have been visited in 1603 by Martin Pring. In 1623 the first settlement on the mainland was effected. That of Thomson at Odiorne's Point and that of the Hiltons at Dover Point have occasioned some controversy among the local historians on questions of priority. Several other settlements followed in the succeeding 20 years. A movement up the Merrimac Valley began and was continued in the later colonial period in accordance with the jurisdictional claims of Massachusetts, which at times were asserted, theoretically, to an east and west boundary three miles north of a point now and since 1632 marked by Endicott Rock in Lake Winnepesaukee at the Weirs. The Connecticut Valley was an attractive region and settlers worked their way northward in the face of the torch and tomahawk, from Fort Dummer to "No. 4" in the intervals between the Indian wars. A much later influx of settlers from southern New Hampshire, Massachusetts, Rhode Island and Connecticut should also be noted. Practically the whole of the northwestern portion of the State had remained ungranted and unsettled until the English conquest of Canada in 1760. But as soon as peace assured tranquillity to settlers, a tide of immigration at once set in along the course of the Connecticut and its tributaries, and in the years from 1749 to 1764 Gov. Wentworth granted no less than 129 townships and six individual grants west of the Connecticut and 50 or more on the east side. About the same time still another, but less important movement, was going on in the valley of the Saco.

Political Divisions.—For purposes of administration the State is divided into 10 counties, with county-seats and population as follows:

Counties	Pop. 1910	County- seat	Pop. 1910
Belknap	21,309	Laconia	20,183
Carroll	10,110	Ossipee	5,334
Cheshire	30,639	Keene	10,068
Cook	30,753	Colchester	5,005
		Laconia	3,034
		Haverhill	3,490
		Plymouth	1,000
Grafton	42,653	Lebanon	5,712
		Manchester	20,003
Hillsborough	224,073	Nashua	26,005
Merrimack	53,535	Concord	21,407
Rochingham	32,188	Exeter	6,007
Strafford	38,952	Portsmouth	21,200
Sullivan	10,337	Dover	13,227
		Newport	3,743

The United States Courts.—The Federal circuit and districts courts are held at Portsmouth, Concord and Littleton (population 4,069). The district judge resides at Littleton and the residence and office of the clerk of these courts is at Concord.

Population.—In 1900 New Hampshire stood 37th in respect to population, having a total of 411,588. Of these 323,481 were native born, and 88,107 foreign born. There were 12,924 aliens. In 1910 the State was 39th with 430,572. There are 11 cities with population as follows: Berlin 11,780, Concord 21,407, Dover, 13,247, Franklin 6,132, Keene 10,068, Laconia 10,183, Manchester 20,063, Nashua 26,005, Portsmouth 11,269, Rochester 8,868, Somersworth 6,704.

The suffrage is accorded to males 21 years of age, except paupers, persons voluntarily excused from taxation, and unnaturalized aliens. An educational test was imposed by the last amendment of the constitution. Women may vote in school meetings. The State election is biennial, on the even year, and occurs in November. The governor, council of five members, and the legislature, which consists of 24 senators and (1910) 389 representatives, assume office on the first Wednesday in January of the odd years. The number of senators is fixed at 24, while the membership of the house depends upon population. Concord became the seat of government in 1808, and the state house was erected there in 1819. The ancient New England town system still prevails except in the cities, and is regarded as preferable to the city form of government in municipalities even of very large population.

The Judiciary.—The courts of the State are a supreme court, consisting of a chief justice and four associates, having jurisdiction over issues of law; a superior court, consisting of a chief justice and four associates, having jurisdiction for the trial of issues of fact, the judges of this court attending the trial terms in a circuit of the shire towns which includes the entire State; the 10 courts of probate organized with a judge and register for each county; the municipal courts (one in each of the 11 cities and 33 towns), having limited and preliminary criminal jurisdiction and jurisdiction of civil causes in which not more than \$100.00 is claimed and the title of real estate is not in issue; justices of the peace, having preliminary and limited criminal jurisdiction in towns and places where no municipal court is established and jurisdiction in civil causes to the amount of \$13.33, provided the title to real estate is not involved. The board of railroad commissioners, the board of license commissioners and the board of equalization of taxes also have judicial functions. Admission to the bar requires three years of actual and certified study, followed by examination, both oral and written, before a standing board of examiners appointed by the court. Certificates of graduation from law schools are not accepted in lieu of actual qualification, ascertained in the manner above stated.

County Government.—A board of three commissioners elected by popular vote are the executive officers of each county. These officials also have certain judicial functions relative to the laying of highways, the settlement of paupers and issues of fact referred to them for trial by the superior court. The members of the legis-

NEW HAMPSHIRE

lature for each county, assembled in convention, are a legislative body for the county. They vote taxes for county purposes and direct as to their expenditure.

Agriculture.—About 62.6 per cent. of the land area of New Hampshire, or 5,640 square miles, is devoted to agriculture. In the early life of the State this industry, as is usual in most new communities, largely predominated over all others, and although it now occupies a second place, it is still of great importance. The soil along the sea-coast and in the river valleys is fertile, while the upland farms require careful treatment to render them fairly productive. The number of farms has fluctuated only slightly from decade to decade since 1850, and in 1910 is 26,913, or 2,411 less than at the last census. These farms contain 3,242,000 acres, of which 927,000 are improved, and 2,315,000 are unimproved. The acreage of improved land has decreased 14 per cent since 1900. This significant fact denotes a readjustment of methods to meet the competition of the West. Cereals and crops requiring large areas have given place to the more intensive forms, such as dairying, fruit growing, market gardening, poultry raising, etc. From 1900 to 1910 the value of farm land has increased \$8,828,000, being estimated (1910) at \$44,327,000. A board of agriculture, established in 1820, a board of cattle commissioners, established in 1891, and an extensive and an influential State section of the Patrons of Husbandry, introduced in 1873, are directing, co-operating and stimulating forces in the field of agriculture. The recently organized Board of Commissioners for the examination of veterinary surgeons, as well as efficient laws governing the inspection of cattle, of milk and other food products, and the prevention of the adulteration and the commercial imposition of fraudulent and deleterious food stuffs, are in the domain of official activity endorsed or sustained by the State in the interest both of improved agriculture and the conservation of the public health. These agencies are partly under the direction of the Board of Agriculture, partly subordinate to the State Board of Health, and partly in the exercise of functions under organizations distinct from either of those boards.

Manufactures.—The excellent water-power privileges upon the numerous streams of the State early became a controlling factor in the permanent location and development of manufacturing industries. Since 1850 the progress has been striking, especially compared with the slow growth of population, and during that period manufacturing has supplanted agriculture as the leading industry of the State. While the increase of population since 1850 has been but 20.4 per cent, that of the average number of wage earners has been 159.9 per cent. In 1850 the latter constituted only 8.5 per cent of the population, while in 1900 they had increased to 21.1 per cent. The manufacture of boots and shoes has assumed strikingly large proportions, and now, with a total output of \$23,405,558, occupies the first place, which for a long time was held by the manufacture of cotton goods. Although the latter industry has now taken second place, its growth has been steady. The Amoskeag corporation continues to hold its rank as the largest single establishment for the manufacture of cotton goods in the world. The total production is about \$23,000,000 annually. The

woolen industry ranks third, its history extending over a period from 1801 when James Sanderson built, at Ipswich, the first carding mill in the State. The total output of this industry is valued at about \$10,500,000. Lumber and timber products, the fourth in rank, date their history from the erection by Mason's colonists of the first saw-mill in New England near Portsmouth in 1635. The lumber mills in Berlin and Lincoln have been developed and improved in recent years until they are among the most extensive and best equipped in the United States. The total production is about \$9,225,000. Among other important industries are the manufacture of wood-pulp, hosiery and knit goods, and foundry and machine-shop products. There are (1909) 1,961 manufacturing establishments with a total capital of \$139,871,000, and a production of \$164,661,000. They were paying \$40,286,000 to 82,041 wage earners. Important brewing and distilling establishments are located at Portsmouth and Manchester.

Finance.—The report of the treasurer for the fiscal year ending 1 Sept. 1910 showed a total of receipts and cash on hand (from 1 Sept. 1909) of \$3,046,216.12, disbursements for the same year \$2,666,771.05, leaving cash on hand, \$379,444.87. The net indebtedness of the State at that date was \$1,293,209.33. The assessed valuation of taxable property was \$255,085,571, and the rate \$20.58 per \$1,000.

Banks.—In 1792 the first bank was established at Portsmouth on 30 June 1909. There were 56 National banks, having 9,528 depositors and \$1,710,780.41 savings deposits, 9 State banks, having 13,888 depositors and \$4,655,577.86 savings deposits, 51 savings banks with 174,341 depositors and \$77,693,356.95 savings deposits. The loans and discounts of the National banks were \$16,127,647. The average deposits to each depositor in the savings banks was \$446.08. No private banks or loan and trust companies made report. The supervision of State banks is permitted to a board of three commissioners, whose office was established in 1837.

Insurance.—A total of 108 fire insurance companies were doing business in the State 1 April 1903. Of these 30 were mutual; 78 were stock companies of which 30 were domestic, and 48 foreign. There were also 26 life insurance companies, 7 fidelity and surety companies, 18 casualty companies, 6 assessment casualty companies and 29 fraternal associations. The total of premiums received by all companies was \$3,965,925.53, and the total of losses paid was \$2,126,498.93. It was in New Hampshire that the valued policy law first became established after a notable contest with the insurance companies in 1885. A single State commissioner supervises all branches of insurance. The office was created in 1851.

Railroads.—The first railroad was chartered in 1835, since which time the mileage has increased to 1,189.34. The railroads of the State are now consolidated under the systems of the Boston & Maine, which operates 1,037.15 miles, the Maine Central, 100.13; the Grand Trunk, 52.06. There has been but one accident in New Hampshire since 1883 in which a passenger has been seriously injured, while being transported upon a steam passenger train. In 1900 there were 10 street railways, with a mileage of 138, which had issued stock to the amount of \$1,478,000.00; and bonds to the amount of \$1,486,744.76. A

NEW HAMPSHIRE

railroad commission of three members has been appointive since 1883, but the office as first established in 1844 was elective and continued to be for 40 years. Under later laws the functions of the commission have become greatly extended.

Accommodation for Tourists.—The State is becoming the home and a place of sojourn of thousands of those who are seeking recreation and location in a region of the most healthful climate and the most attractive ocean and mountain scenery on the eastern side of the national domain. Recent statistics of this business exhibit an investment of \$10,442,352 in the State. The help employed in 1899 was 12,354, with wages of \$539,901; 204 towns were entertaining summer tourists, more than 20,000 of these people occupied cottages in 1899. They were also patronizing several hundred hotels, and 1,624 farm houses. The volume of this business estimated by its cash receipts in 1899 was nearly \$7,000,000.

State Institutions.—The New Hampshire Asylum for the Insane, founded at Concord in 1838, is supported by occasional State aid, the income of invested funds, and sums paid by individuals for care of patients. Each county has also its own insane asylum and almshouse. The State board of health is also a commission of lunacy. The New Hampshire Orphans' Home was established at Franklin in 1871. It is undenominational, and is supported by voluntary contributions. The State prison at Concord was established in 1812. There is also an industrial school at Manchester, and a School for the Feeble Minded at Laconia. The New Hampshire Conference of Charities and Correction is a semi-official organization, wholly educational in its purposes. A considerable number of well ordered and beneficent institutions devoted to hospital purposes, the care and education of orphans and other worthy objects of religious charity have been established at populous points and are maintained by the authorities of the Roman Catholic Church. Many local hospitals are established under secular control, by municipal support or through private benefactions. Eighteen of these institutions are located as follows: Berlin, Claremont, Manchester (3), Plymouth, Exeter, Dover, Nashua (2), Laconia, Hanover, Concord (2), Portsmouth, Woodstock and Whitefield. Homes for orphans and retreats for the aged are established at Manchester and Concord, one by the Masonic fraternity and the other by the order of Odd Fellows.

Public Health.—This function of the State government has been developed to a very efficient status since its inception in 1881. The science of preventative medicine is applied with intelligent efficiency and upon the most approved modern methods. Registration of vital statistics, bacteriological analysis and other subjects related to State medicine are under the direction or supervision of the State board of health. Independent of the Board of Health, both in action and organization, and yet properly regarded as agencies of the State's paternalism in respect to the public health, are the department of examination and registration of practitioners of medicine, auxiliary to which are the several boards of examiners designated by the state associations of doctors of medicine representing the several schools of practice, the similar board appointed by the state association of dentists,

and the commissioners of pharmacy and practical chemistry. The New Hampshire Medical College, established at Hanover in 1798, is a high class institution and practically a department of Dartmouth College.

Public Libraries.—New Hampshire has been a pioneer in and sturdy supporter of the library movement. Perhaps the earliest mention we have of it is in connection with a lottery in Portsmouth in the year 1750 in aid of an association library. From 1792 to 1883, 220 libraries received special charters from the legislature. These were mostly private library corporations which have now given place to, or become merged in the public library. The first free public library in the United States was established in Peterborough in 1833. The State was in 1849 the first to pass a law authorizing towns to aid in establishing and maintaining public libraries. This was followed logically by the second and third steps in the progress, namely, by the law of 1891 granting State aid to town libraries, and by the compulsory law of 1895, requiring every town to appropriate a certain proportion of its taxes for the support of a public library. The first legislative incorporation of a State library association was by New Hampshire in 1889. There are about 300 public libraries reported. The number of books contained in them and accessible to the public, exclusive of reports and pamphlets, is 900,000. The State Library now occupies a separate establishment and has a collection of nearly 100,000 volumes.

Education.—Since 1885 the common schools of the State have been organized on the town district system. Attendance from 8 to 14 is compulsory. In the school year of 1908 the total enrolment of pupils was 64,036, or about 75 per cent of the school population. The average number of days for the year was 199.1, and the number of teachers 2,999. The total value of school property was estimated at \$5,000,000. The State Normal School was established in 1870, and is located at Plymouth. Its attendance is now about 150. There are 30 academies and seminaries, and 3 colleges: Dartmouth, founded at Hanover, 1769; New Hampshire College of Agriculture and Mechanic Arts, at Durham; and Saint Anselm's College, at Manchester. Among the secondary schools of national reputation are Saint Paul's at Concord and Phillips Exeter. The cities and larger towns all have high schools supported by the public taxes and revenue. Seventy-one seminaries, academies and high schools are registered by the State Superintendent of Instruction as equipped to provide college preparatory courses. Tuition, text-books and all school supplies are free to the pupils to the completion of the high school course. Parochial schools are in successful operation in many places under the control and patronage of the Roman Catholic Church.

Military Affairs.—Between 1675 and 1764 the people of New Hampshire participated in six wars against the French and Indians, aggregating a period of 38 years. The frontier position of the State made it peculiarly exposed to attack by the Indians, from whose ravages it suffered severely. The State contributed 500 men toward the siege of Louisburg, and the same number for the operations at Crown Point in 1755, and at other times in this war 2,600 more soldiers. In 1775 the population of the colony

NEW HAMPSHIRE

was only 82,200. In the province militia establishment there were 13 regiments of foot and 1 of cavalry, besides special organizations of cadets and of artillery. The capture of Fort William and Mary in Portsmouth Harbor, under the leadership of John Langdon and John Sullivan, occurred 13 Dec. 1774, over four months before the battle of Lexington. The powder which was taken on this occasion later supplied the patriot army assembled about Boston, and was returned to the British in a different form at the battle of Bunker Hill, so-called, where New Hampshire men constituted over one half the Americans actually engaged. The passing of royal authority in the province was attended with very little commotion, and comparatively no manifestation of violence. The convention of 21 April 1775 caused a reorganization of the militia in August of that year, and in 1777 the number of regiments had been increased to 17. The number of men enrolled in 1775 was 16,710, and this comprised practically all residents of military age in the State. In that year three regiments were raised for service in the continental field. One regiment was in Canada; 33 companies under Colonel Wingate were guarding the sea-coast; 2 companies of men from this State were detached from Washington's army and accompanied Arnold in his famous march through Maine to Quebec, Coos and the Connecticut Valley were guarded, while 31 companies were raised to replace the Connecticut men who declined to remain longer at the siege of Boston. Undoubtedly more than 5,000 of the men of this State were in the field in 1775. In 1776 the three New Hampshire regiments of the Continental line were continued and strengthened, distinguishing themselves in the Canadian service, at Trenton and Princeton. Sullivan for superior conduct in bringing the unsuccessful American forces out of Canada in 1776, in the face of formidable difficulties, was made a continental major-general. Bedel led a new regiment into Canada, while one regiment was transferred from the coast to the aid of Ticonderoga, and four more regiments reinforced the patriot army at different points that year. New Hampshire's contributions reached high water mark in 1777. In May large bodies of organized militia marched to the relief of Ticonderoga. The regiments in the continental line remained in service and distinguished themselves at Stillwater, Saratoga, and other critical points. Stark's brigade at Bemington struck the blow which decided the fate of Burgoyne's invasion. When Stark's men returned to their farms and harvests, Whipple's brigade was forwarded with promptitude and energy to reinforce the northern army under Gates. Meanwhile Stark assembled another force of New Hampshire volunteers and with them was in season in this, his second campaign of the year, to complete the investment of Burgoyne along the Fort Edward fords. A number of New Hampshire companies also served against Burgoyne in Vermont organizations. In addition a regiment was sent to the aid of Rhode Island. The winter of 1778 found the New Hampshire men of the continental line at Valley Forge, and in the summer Whipple's brigade took part in the Rhode Island campaign under General Sullivan. In the remaining years of the war New Hampshire contingents served where the exigency of the contest led them, from the northern

frontier to Virginia, bearing themselves with valor and effectiveness at Monmouth, against the Six Nations, and acting an important part in the campaign which culminated in the surrender of Cornwallis at Yorktown. One New Hampshire regiment, at least, and possibly two, and John Stark, who had been made a continental brigadier-general after Bennington, continued in the regular or permanent continental service under Washington or in other important commands until the end. Among the New Hampshire statesmen whose names must always stand high on the records of revolutionary service and achievement are Weare, Langdon, Livermore, Bartlett, Dudley and Gilman, and conspicuous also in military fame are Sullivan, Stark, Poor, Scammell, Whipple, Cilley and Dearborn. It is not improbable that of approximately 17,000 men in New Hampshire then capable of bearing arms, about 20 per cent of the total population, nearly every man was in active service, and, many of them, through repeated terms of enlistment; and in that seven years of struggle, no armed enemies in visible organization crossed the boundaries of the Granite State.

War of 1812.—Early in the War of 1812 Portsmouth was fortified and garrisoned, and the northern frontier guarded by a company at Stewartstown. Many New Hampshire men distinguished themselves in this war, among whom was Major-General Henry Dearborn, the Revolutionary war veteran, and Major-General Eleazar Wheelock Ripley, later a member of Congress for Louisiana.

Mexican War, 1846-8.—Upon the outbreak of the Mexican War the State responded with spirit to the calls of the President, and promptly forwarded its quota. Franklin Pierce was a brigadier-general, and participated in Scott's campaign. Several New Hampshire men who later became prominent in the war for the Union began their military career at this time.

War of 1861-5.—In the war for the Union, 17 full regiments of infantry were sent into the service from New Hampshire. The State also contributed a battalion of cavalry, afterward enlarged to a regiment, a part of a separate (17th) regiment, united with the second, three companies of sharpshooters, a battery of light artillery, and a regiment of heavy artillery. Besides these it furnished a liberal number of men for the navy. The total number in the service was 32,750, or 10 per cent of the whole population. Their record was long and brilliant. The first Kearsarge was a New Hampshire ship. A good number of marines and sailors and a long array of worthy naval officers represented the State in that branch of the public service.

There were no military leaders in this war, residents or natives, of New Hampshire, who would be assigned to the class in which Grant, Thomas, Sherman and Sheridan stood. On the civil side, however, both in the war period and in the reconstruction years, natives and residents of this State were conspicuous at the very fountain heads of power and influence. In the Senate Wilson, a native of Farmington, was chairman of the committee on military affairs, Hale, naval affairs, Fessenden, native of Boscaawen, finance and appropriations, Grimes, native of Deering, District of Columbia, Z. Chandler, native of Bedford, commerce, and Clark, claims and president *pro tempore*. In the cabinet suc-

2 Bethlehem, White Mountains

NEW HAMPSHIRE

tensively holding the treasury portfolio were Dix (Boscawen), Chase (Cornish) and Fessenden Greeley, native of Amherst, was the greatest intellectual force in the journalism of that day. Dana was assistant secretary of war. Dix, Butler, native of Deerfield, John G. Foster, native of Whitefield, and Fitz John Porter, native of Portsmouth, were major-generals. Walter Kittredge, author of 'Tenting on the Old Camp Ground,' and Charles Carleton Coffin, who was the historian of the war for the youth of the land, were of the Granite State. In the naval service were John G. Walker, Belknap, Parrott, Pearson, Storer, Wyman, Pickering, Prentiss, Browne, Long, Miller, William S. Walker, Perkins, Spence, Thornton, Park, and Craven. In the years immediately following the War, Zachariah Chandler, W. E. Chandler, Marshall Jewell and Amos T. Akerman of the New Hampshire stock were called to the cabinet, Horace Greeley and Benj. F. Butler were named for the presidency, and Salmon P. Chase ended a notable career as chief justice of the Supreme Court of the United States.

Spanish-American War, 1898.—In the war with Spain New Hampshire's quota, a full three battalion regiment of infantry, though filled with promptitude, was not called upon to go farther than the concentration camp at Chickamauga. This regiment was commanded by Robert H. Rolfe. General Leonard Wood was a native of New Hampshire, as were Admiral Asa Walker and other distinguished naval officers.

National Guard.—This organization has a brigade formation. There are now two regiments of infantry, each of 12 companies, in battalion arrangement; a four gun light battery; a troop of cavalry; signal corps; hospital corps; and two regimental bands—109 officers, 48 musicians, 1,175 enlisted men—total 1,332.

History.—Three of the four original towns, Portsmouth, Dover, Exeter and Hampton, occupied the interesting position of independent democracies between 1622, the year when Thomson's indenture was drawn and the first settlement definitely planned, and 1643, when they had all become, by their own choice or the necessities of their situation, constituent parts of the Massachusetts Bay Colony. This was the first union with Massachusetts Bay, and was conditional on certain important privileges and guarantees accorded to the towns by the Massachusetts General Court. The history of the period of this union is in a large measure identical with that of Massachusetts Bay. In 1679 the Masonian heirs succeeded in procuring in the home government orders for the establishment of a separate province for these four frontier towns. John Cutt, a merchant of Portsmouth, was the first President, as the chief magistrate was then styled. The four towns were made a part of the Dominion of New England in 1686. This government under Dudley and Andros survived only three years. From the spring of 1689 to the latter part of the winter of 1689-90 the New Hampshire towns governed themselves in the independent democratic fashion of the first period of their history. A second union with Massachusetts Bay was then effected and continued for two years. In 1692 the province government by royal commission was re-established and subsequently administered by appoint-

ees of the crown until 1775. With the governor was associated a lieutenant governor, and a council appointed by the king. The legislative function was vested in a general assembly constituted of the governor, the council, and the deputies, elected by freeholders. The right of veto was committed to the governor and the right of confirmation and disallowance of laws remained with the crown. From 1699, when the Earl of Bellomont assumed office, to the termination of Belcher's administration 1741, this province and Massachusetts had the same governor. The provincial assembly was continued until the departure of Governor John Wentworth in 1775. A succession of conventions beginning with that of 21 July 1774, finally resulted in the formal organization of a legislative body on a full representation of the people in view of the apparent necessity of establishing a new state government. The people of New Hampshire entered upon the active stages of a national movement for independence with deliberation and unanimity. Perhaps no one of the colonies was so free from the so-called loyalist element as was this. The 'Association Test' put every man on record, either for or against the common cause. The original files are preserved, and the names of those who dissented or refused to take an unequivocal position constitute a surprisingly meagre list.

The civil government of New Hampshire from the time of the departure of Gov. Wentworth to the organization of a new form of government in June 1784, under the constitution of 1783, was purely legislative. The constitution of 1776, probably the first adopted by either of the thirteen States, by its own independent action, was a brief instrument and evidently intended to be temporary, or, as it was officially stated at the time, "to continue during the present, unhappy and unnatural contest with Great Britain." It was adopted and promulgated by the fifth convention, chosen in the latter part of 1775, and it was never submitted for acceptance or rejection to (or formally ratified by) the people. During the period of the Revolution the administrators of the New Hampshire government were embarrassed by a serious defection in the western part of the State, and particularly in Grafton County. Many of the leading men of the Connecticut River towns were from Connecticut, and their ideas of government were naturally in accordance with their education and experience in the commonwealth from which they had emigrated. The form of government temporarily adopted by the Fifth Provincial Congress was not acceptable to the majority of these people. The group of towns which included Gunthwait on the north and Lebanon on the south in Grafton County organized themselves into associations for purposes of civil and military government, and formally declined to recognize the new state government of New Hampshire. The contention of the 'New Connecticut' party, so called, was, that upon the dissolution of political relations between the colonies and the mother country, and more especially in respect to the territory in controversy between New York and New Hampshire, the towns, being the political units, and the original source of political authority, were invested with the right to determine for themselves the question whether to accord

allegiance to one or the other of the disputing States, or whether to erect themselves into an independent State. They urged that inasmuch as the constitution of 1776 had never been submitted to the people, or to the towns for ratification, and had been accepted by a part of the towns only, it was operative only upon such as had elected to ratify its provisions. Their argument was presented with great skill and effectiveness, and although the movement ultimately failed to accomplish its purpose, its sponsors succeeded in making themselves felt as a political force to be reckoned with by three established States, and the Continental Congress, as well as the prospective commonwealth of Vermont. In 1783 a new State constitution, modeled closely upon the Massachusetts constitution of 1780, was adopted, which, except as modified by the amendments emanating from the subsequent conventions of 1791-2, 1820, 1876, 1880, and 1902, still remains in force. In 1787 a Federal convention formulated a constitution for the United States of America. At this critical time the Constitution became the organic law of the new nation on its ratification by New Hampshire, the ninth State, in June 1788. John Langdon of New Hampshire was chosen president, *pro tempore*, of the first session of the United States Senate under the new Constitution, and to him fell the honor of informing Washington of his election to the presidency. In the years immediately ensuing the Federalist party was evolved and was in political control at an early date in this State, but gave place to the Anti-Federalists, then known as Republicans—the Jefferson party of that day—from 1805 to 1812 (both of these years inclusive,) except 1809, when Jeremiah Smith, Federalist, broke in upon the succession as Governor. In 1813, 1814, and 1815 the Federalists were again in control of the State. In 1816 they met with irretrievable defeat, and thereafter the Jeffersonian Republicans remained in power, excepting in the brief period of a temporary reverse in 1846, until permanently overthrown in 1855 by the American party, more commonly called the "Know-nothings." The earlier part of this period was one of ecclesiastical agitation. The people of New Hampshire had become in the later colonial period almost entirely Congregationalists, and that denomination had maintained its ascendancy as practically a state church during a long period, the town ministers being called by the church, approved in town meeting and supported by public taxation. Universalists, Baptists, Methodists, and Free Thinkers had now become potent enough to assert themselves effectively in politics, and the contest reached its culmination in the so-called toleration act of 1819. Hosea Ballou, a New Hampshire minister, was the founder of Universalism in its modern form, and Benj. Randall, another minister of this State, was the founder of the Free Baptist denomination. The latest New Hampshire contribution to religious denominationalism is Christian Science, the founder and chief exponent of which is a resident and native of this State. In this year, 1819, also, was decided the historic Dartmouth College case, which Senator Lodge described as one "in its effects more far-reaching and of more general interest than perhaps any other ever made in

this country." Through this futile attempt by the State to amend the charter of Dartmouth College for the purpose of reorganizing the government of the institution, inviolability of charters never before enjoyed was secured. Incidentally the case served to make prominent and to bring into the view of the whole country the fact that in Daniel Webster, Jeremiah Mason, Jeremiah Smith, Ichabod Bartlett, and their compeers, there was at the bar of New Hampshire, and on the bench of her highest court, a group of jurists whose law learning and forensic ability could not be surpassed at that day in the entire length of the Union.

In 1826 occurred the anti-Masonic uprising, which drifted into politics, and for a time commanded serious attention. The second quarter of the 19th century was remarkable for the number of men of New Hampshire birth and residence who held commanding positions in shaping the destiny of the republic. The names of Webster, Cass, Woodbury, Pierce, Kendall, Chase, Hale, Atherton, Clifford, Tuck, and Greeley constitute a conspicuous part of a long list that might be enumerated.

The years following 1846 were marked by the development of a strong reform sentiment especially in the cause of temperance and on the slavery question. In case of the former, the movement resulted in the prohibitory law 1855, which became the accepted principle of liquor legislation until at length a reactionary sentiment expressed itself in the license act of 1903. The slavery movement found many earnest and devoted adherents, intense and uncompromising in their propaganda. The Free-soil vote had already appeared in 1841, and continued to be of more or less importance until 1856. Until 1896, with the exception of a significant, and with many of its participants, permanent revolt from the Republican party in 1872, political alignments had been strictly maintained, and political contests had usually had more or less of the hazard of uncertainty. The Free-silver agitation of 1896 found New Hampshire voters strongly in favor of the gold standard, and led to many transfers of party allegiance. Since 1896, the Republican party has had control of every department of the State government and carried every State election except in the years 1871 and 1874.

In the constituents of population, the descendants of the original New England stock still predominate. From an early date, however, there have been at intervals important additions of Irish Presbyterians and Irish Catholics. The representatives of this race from both its sectarian branches, have been speedily assimilated and are adepts at leadership in business, the professions and public affairs. The German immigrants manifest the same assimilative tendencies. The Canadian French are becoming also an important part of the population. They adapt themselves with facility to trade, agriculture, mechanics, and as operatives in manufacturing establishments. They are represented in all the learned professions, but more numerous in the priesthood and medicine. The activities and resources of the State, religious, benevolent, commercial, industrial educational, and productive, as manifested in visible results, were never in more satisfactory adjustment having reference to a fair and reasonable dis-

Editor of State Papers, Littleton, N. H.

New Hampshire College of Agriculture and Mechanic Arts, opened in 1867, at Durham, N. H. The courses offered include the regular four years' courses in agriculture, mechanical and electrical engineering, technical chemistry, and general science, for completion of which the degree of B.S. is conferred; a two years' course in agriculture; and ten weeks' winter courses in agriculture and dairying. There is also a preparatory department; and the State experiment station is connected with the college. Women are admitted to all courses, but form a small proportion of the student body. The income of the college is derived from the Federal land grant of 1862 and from Federal and State appropriations; in 1910 the total amounted to \$181,000; the students numbered 452 (93 women), and the faculty 35.

New Han'over, an island of the Bismarck Archipelago (q.v.), about 40 miles long and 20 miles broad, northwest of New Ireland, or New Mecklenburg (q.v.), from which it is separated by Byron Strait.

New Harmony, Ind., town, in Posey County; on the Wabash River, and on the Illinois Central railroad; about 25 miles in direct line northwest of Evansville. The first settlement was made by a German community called Harmonists (q.v.), in 1815. In 1824 Robert Owen purchased the village and domain and the Harmonists returned to Pennsylvania. The next year Owen established a "Preliminary Society" and issued a general invitation to all "the industrious and well disposed of all nations" to join the new community which was to be governed and conducted on new plans. All goods were to be held in common, but their use was regulated by age; "moral lectures" were to replace religious worship; the young were to be educated by trained teachers, and this education was to begin when the children were two years of age. The whole experiment proved a failure; those who accepted the invitation were not all "well disposed" and many were far from "industrious." In 1826 Owen assumed control of the community and established order; but in a few months dissensions arose, three communities were formed of the original one, and soon after the "community idea" was abandoned. One of the leaders, William Maclure, purchased part of the land and established an industrial school which also was a failure. The free library of the Workingmen's Institute, established in 1838, is in a most flourishing condition and contains about 16,000 volumes. The town has some manufacturing establishments, chief of which are flour and lumber mills and brick works. Pop. (est.) 1,300.

New Haven, Conn., city and county-seat of New Haven County, and the largest city in the State. It is popularly called "the City of Elms" from the magnificent elm trees planted there over 100 years ago. New Haven lies at the head of New Haven Bay, four miles distant from Long Island Sound. It is on the New

York, New Haven & Hartford railroad, 36 miles from Hartford and 74 miles from New York city.

Topography.—The city lies on a level sandy plain, bordered on the east and west by the West and Quinnipiack rivers. It has an area of 23 square miles. "The Old Green" is a public square in the centre of the city, about which the original settlers lived, and used at night as a corral for their cattle. It also for years was the public burial ground. The bones of thousands lie there to-day. Near the city limits rise East Rock and West Rock, 360 and 400 feet in height respectively, from the summits of which a fine view of the city and surroundings may be obtained. East Rock, which has been made into a park, is crowned at its summit by a monument dedicated to the Connecticut soldiers and sailors who fell in the Civil War. The entire park system in New Haven embraces nearly 1,200 acres. The sewer system is most complete, including 95 miles of sewer.

Streets and Avenues.—Chapel street, the business promenade, extends in a northwesterly direction throughout the length of the city. The homes and dwelling houses are generally surrounded by gardens, and many of them are almost hidden from view among trees. The number of magnificent elms with which the principal avenues are planted were mostly set out about the close of the 18th century by James Hillhouse, or through his influence and example. Early residents laid out the city with four streets running nearly north and south and four streets running east and west, thus dividing the city into nine squares each a quarter mile long, the central block being a public square, and roadways were built at various angles, with "The Old Green" as a common centre. In 1903 there were 225 miles of streets and avenues, of which 90 miles were paved.

Prominent Buildings.—Here is the seat of Yale University (q.v.), with its numerous halls, dormitories, schools and special buildings which are celebrated in educational and historical annals. The Yale Campus, which lies directly west of "The Old Green," is a rectangle containing two city blocks. A series of college buildings form an enclosed court about the campus. Two of these buildings, Vanderbilt and Osborn Halls, are among the chief architectural attractions of the city, though Woolsey Hall is the most beautiful of all the university buildings. The Sheffield Scientific School and the departments of law and medicine, are a little removed from the campus. The Hopkins Grammar School, founded in 1660, is also located here. Other buildings and institutions are the State Normal School; the Boardman Manual Training School; the Hillhouse High School; New Haven Hospital; Grace Hospital; Saint Francis Roman Catholic Orphan Asylum; the Public Library, containing 60,000 volumes; New Haven Orphan Asylum and the Young Men's Institute. Here are also the archives and libraries of the New Haven Colony Historical Society and the American Oriental Society.

Churches and Schools.—New Haven has 70 churches, some of which were built as early as 1800. In the old burying ground in Grove street are the graves of Noah Webster, Theodore Winthrop, Eli Whitney, F. B. Morse and other celebrities. The churches are divided among the following denominations: Congregational, 17;

NEW HAVEN COLONY — NEW HEBRIDES

Methodist Episcopal, 14; Protestant Episcopal, 12; Roman Catholic, 9; Baptist, 7; Lutheran, 4; Jewish, 4; and Universalist, Unitarian, and others. There are 40 public school buildings in the city, with a daily attendance of 20,000. The school system is maintained at a cost of \$380,000 annually.

Trade and Commerce.—New Haven up to the middle of the 19th century was an important ship-building centre, but this industry has gradually diminished. Ship-building interests were seriously crippled by the Embargo (q.v.) and the War of 1812. There is an excellent natural harbor here which has been improved and enlarged at State and Federal expense. New Haven has two lines of steamships to New York and is the commercial and distributing centre for a large section of the State. In manufacturing New Haven ranks first among Connecticut cities, and has many and varied industries, including clocks, watches, hardware, firearms, ammunition, wagons, carriages, engines and boilers, automobiles, rubber goods, wearing apparel, iron foundries, machine shops, canneries and packing houses. The headquarters and repair shops of the New York, New Haven & Hartford railroad are also located here. According to the last census, New Haven industries represent a capital of \$30,464,000, with an annual production valued at \$40,762,000. Over 20,000 persons are employed in the 1,300 factories of the city and over \$12,000,000 are annually paid in wages. The city has a dozen national banks, and numerous trust companies, state banks, savings banks and buildings and loan companies.

Government.—The city maintains municipal government under a special charter of 1807, which controls all municipal affairs including the old school district of New Haven; but the 13th ward of New Haven, Westville, is independent of the city in the management of its schools. A mayor, elected every two years, is the city's chief executive, and he has the power to appoint a majority of the municipal administrative officers. The city affairs are administered by a board of aldermen of 21 members, which appoints the assistant city clerk. The sheriff, city treasurer, collector of taxes, city clerk and comptroller are elected every two years by popular vote. The board of selectmen consists of seven members elected for the purpose of admitting electors to the voting privilege. The administration of the school district is in the hands of a Board of Education of nine members, appointed by the mayor. The fire and police departments of the municipality are managed by Boards of Commissioners, the latter bi-partisan. The central clearing house is the Board of Finance, which fixes the rate of taxation and makes the appropriations.

Municipal Finances.—The assessed valuation of real and personal property in 1910 was \$126,889,036, including exemptions. The provided debt of the city amounted to \$1,873,430. The city expends each year for maintenance and general expenses \$1,415,000; of which the largest item is \$320,000 for schools; police department, \$190,000; fire department, \$150,000; interest on provided debt, \$140,000; street cleaning, \$90,000; lighting, \$80,000; charity, \$75,000.

History.—New Haven was settled in 1636 by

a company of Puritans chiefly from London under Theophilus Eaton, their first governor, and the Rev. John Davenport. It was a distinct colony until 1660, when after a protracted struggle it was united with Connecticut under the charter of 1662. It was incorporated as a city in 1784. In its earliest days New Haven was called Quinipiak by the Indians. It was also called Roodenberg by some of the early colonists. The Indian chief Momanguin sold a large tract of land here to the London company, receiving in return an assortment of coats, hatchets, spoons and knives. Treaties were signed by both parties, the Indians agreeing not to "terrify, disturb or injure" the settlers, who in turn promised to protect the Indians, and allow them to hunt in portions of the ceded territory. Another tract 10 miles wide by 12 miles long was purchased six months later, and in June 1639 a fundamental and written constitution was adopted by the settlers. The privilege of voting and holding office was strictly limited to church members. In both civil and church affairs the Bible was the only recognized law.

Theophilus Eaton, the first governor of the New Haven Colony, was re-elected and retained the office until his death in 1658. The city of New Haven was incorporated in 1784 and Roger Sherman was its first mayor. He was mayor and United States Senator when he died. The boundary of the Connecticut Independent Colony under its charter of 1662 embraced the towns of Milford, Stamford, Guilford and Branford known as the "New Haven Colony," and in 1665 the New Haven towns submitted to the Connecticut charter. In 1701, New Haven was made a joint capital with Hartford, and remained as such until 1874. Yale College was removed from Saybrook to its present site in 1717. The town was captured 5 July 1779 by a British force under Gen. Tryon and Garth after a sharp skirmish. In this engagement the Americans lost 29 killed and 17 wounded, while the British loss was 70 killed and 40 wounded. After its incorporation as a city New Haven began to make rapid strides. Steamboat communication was opened with New York in 1815, and the first railroad entered the town in 1839.

Population.—In 1800 New Haven had a population of 4,049; (1850) 20,345; (1870) 50,840; (1880) 62,882; (1890) 81,258; (1900) 108,087, including 30,000 of foreign birth and 2,800 of negro descent. The population in 1910 was 133,605.

New Hebrides, *Néb'ri-déz*, a group of islands in the South Pacific, east of Australia, extending from lat. 13° to 20° S., and from lon. 165° to 170° E.; area, about 4,900 square miles. The largest ones are Mallicollo, and Espiritu Santo (q.v.). Tanna has an active volcano; and in consequence probably of vol-

NEW IBERIA—NEW JERSEY

canic action, Aurora, one of the most fertile, sank out of sight in 1871. Some of the group are of coral formation. They are all wooded and hilly; ebony and sandalwood being obtained; their chief products are yams, bananas, coconuts, and sweet potatoes. The chief animal is a small pig, not larger when full-grown than a rabbit. The native inhabitants, belonging to the Papuan race, are in general degraded and very ferocious, except on Aneityum, where there are Christian missions, and where the majority of the inhabitants can read and write. These islands, according to the Anglo-French convention of 1887, are under the control of a mixed commission of French and British naval officers. The population is decreasing; in 1910 it was less than 50,000.

New Iberia, i-bé'ri-á, La., town, parish-seat of Iberia Parish, on the Bayou Teche, and on the Southern Pacific railroad; about 100 miles in direct line west of New Orleans. A short railroad extends to Avery Island, where there is a valuable salt-mine. It is in a fertile agricultural section, in which the chief products are the pepper, from which tabasco sauce is made, cotton, sugarcane, corn, rice, vegetables, and berries. It has considerable manufacturing; some of the industrial establishments are machine-shops, a knitting-mill, ship-yards, foundries, wagons, brick works, soap factories, cottonseed-oil mills, factories for different lumber products, and tabasco sauce factory. The town is in a section of the State mentioned by Longfellow in 'Evangeline.' It has a government building, a city-hall, and a large public market. Its educational institutions are the public and parish schools for white and colored children, a high school, and a public high school library. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 3,447; (1900) 6,815; (1910) 7,400.

New Ireland. See **NEW MICKLENSBURG**.

New Jersey, the "Garden State," and one of the original 13, adopted the Federal Constitution, by unanimous vote, in convention 18 Dec. 1787. The State is bounded on the north and east by New York and the Atlantic Ocean, on the south and west by Delaware and Pennsylvania. Of the 487 miles of total frontier, only 48 miles are defined by natural boundaries. Capital, Trenton. Area, 8,224 square miles, of which 710 square miles is water surface. The extreme length of the State is 166 miles, the narrowest portion being 33½ miles. Pop. (1910) 2,537,167.

Topography and Geology.—The topographic features and geological structure of the State are intimately related and are explanatory of the surface conditions. New Jersey is characterized as being on the Atlantic slope of the continent and is divided into four topographic zones: (1) Appalachian, including the Kittatinny Mountain and Valley. (2) Highlands. (3) Red sandstone or Triassic area. (4) Coastal plain.

The Appalachian zone includes the Kittatinny or Blue Mountain and the Kittatinny Valley, occupying the northwestern portion of the State. This range is level-topped, narrow, rough, rocky and heavily wooded. It extends across New Jersey from the New York State line, where it is known as the Shawangunk Moun-

tain, to the Delaware River at the Delaware Water Gap. At High Point, near the northernmost point of the State, it is 1,804 feet high, which is the greatest elevation of the State. The Kittatinny Valley, 10 to 13 miles wide, is shut in by the Kittatinny Mountain on the northwest and by the Highlands on the southeast. It is characterized by high, rolling hills and minor valleys, pleasing landscapes, and beautiful farming country. This valley is continuous, on the northeast, with the valley of Orange County in New York, and to the southwest stretches away into the great Cumberland Valley of the Atlantic slope of the continent.

The Highlands cross New Jersey in a general north-northeast and south-southwest direction. The surface of this zone is hilly-mountainous, and is made up of several parallel ridges, separated by deep and generally narrow valleys. The latter are like the Kittatinny Valley—smooth—and are largely cleared and in farms. The mountain ranges are remarkably uniform in height. This division may be considered as a seaward-sloping table-land, whose northwest side has an elevation of 1,000 to 1,500 feet above the ocean and its southeastern side 600 to 900 feet above the sea. In the northern part there are several lakes elevated amid the mountains—Hopatcong, Greenwood, Macopin, Splitrock, Green, Wawayanda, and Budd's being the more important of these natural upland sheets of water.

The Red Sandstone Plain or Triassic Area, also called the Piedmont plain, is bounded on its northern border by the Highlands. On the southeast, this third great topographic zone merges into the clays and marls of the coastal plain. It is 67 miles long and 30 miles wide at the Delaware River. The trap-rock ridges, known as Palisades, Watchung, Sourland, Cushetunk and other mountain ranges, rise abruptly above the general level of the sandstone plain. They are generally forested, whereas the sandstone country is nearly cleared and in farms. These mountains rise 400 to 900 feet above sea-level. The drainage is largely by the Hackensack, Passaic, and Raritan rivers and their tributaries.

The fourth zone, known as the coastal plain, includes all the country southeast of the Triassic sandstone area and borders the ocean. This zone is about 100 miles long from Sandy Hook to Salem City, and is 10 to 20 miles wide. The surface is hilly in part, but with gentle slopes, except where some of the streams have cut their way through its earthy beds and formed steep-sided stream valleys. The Navesink Highlands and the Mount Pleasant Hills are the highest lands in this zone. The drainage is by many tributaries westward into the Delaware, and by the Atlantic coast streams into the Atlantic Ocean. In the northwestern part of this zone there are clay beds and greensand marls, which make the outcrop on the surface in places; on the southeast there are sands, clays, and gravels, and fringing the sea a narrow range of sand hills or coastal dunes. Within the coastal plain lie the "Pines," a wooded area of so great an extent as to contribute largely to the forest acreage of New Jersey. In lots of 10 acres and over, there are 2,070,000 acres of woodland, with only 2,000,000 acres of im-

NEW JERSEY

proved land in farms. The famous sea-side resorts of the State fringe the coastal plain.

As set forth by Professor John C. Smack, the geologic structure of New Jersey is so related to the topography that observations concerning the physical features give a satisfactory clue to such structure. All of the larger geological formations of the United States, except coal, occur in parallel zones, as has been indicated. These formations extend from northeast to southwest, and a section line across the State from Port Jervis southeast to the ocean crosses them nearly at right angles to their trend. The oldest geological formations in the State are the crystalline rocks of the Highlands. Granite, gneisses, and other crystalline schistose rocks and beds of magnetic iron ore make up the mass of these mountain ranges. These rocks are generally much tilted in position, almost on edge, and are also much faulted. They strike northeast and southwest and dip to the southeast or northwest. The iron ores and zinc ores which are mined in the State are found in these formations. The granite, gneiss, and crystalline limestone or marble, used in building, are also from these Highland formations.

The Palaeozoic rocks are found in the valleys included in the Highlands, in the Kittatinny Valley and Kittatinny Mountain, and in the Green Pond and Copperas Mountains. Cambrian, Silurian, and Devonian are represented, and the rocks are limestones, slates, sandstones, and silicious conglomerates. The magnesian limestones and the slates constitute wide belts in the Kittatinny Valley, the Musconetcong, Pohatcong, Pequest, and other valleys. The Kittatinny Mountain mass consists of sandstones and conglomerates of the Oneida and the Medina epochs of the Silurian age. In the valley of the Upper Delaware, west of this mountain, there are narrow belts of waterlime, Lower Helderberg, and Upper Helderberg, fossiliferous limestones, with Marcellus shale as the highest member of the Devonian within the State. The Green Pond Mountain rocks also have been referred to the Oneida horizon. The limestones and slates are the formations on which the rich wheat lands of Warren County and the dairy farms of Sussex are situated. Stone for building, slate for roofing and flagging stone, and limestone for lime and cement, are quarried in the Palaeozoic areas. Copper, lead, and zinc ores, and barite, limonite, or brown hematite, and glass sand have been worked in many localities.

The red shales and sandstones and the included trap-rocks of the northern-central part of the State are referred to the Jura-trias of Mesozoic time. The sandstone beds dip in general toward the northwest, at a low angle of inclination in the sandstone. The erupted trap-rocks form long ranges of steep-sloping hills or mountains, often crescentic in form. A great deal of excellent sandstone for building and stone for road-making is quarried in this formation. Copper ores occur in the sandstone near the trap-rock or at their junction. Barite also has been mined in the sandstone at one locality.

The cretaceous rocks of the State include the clay district of Middlesex County and the greensand marl developed in Monmouth County, and thence southwest to Salem County. A large amount of clay is dug in the Raritan clay dis-

trict. The greensand marl, dug in shallow pits generally, and in numberless localities, has had a wide use locally as a fertilizer.

The formations of the coastal plain zone, later than the cretaceous beds, are greensand marls of the Eocene, clays and sands of the Miocene, and the clays, sands, and gravels of the post-Tertiary. They are recognized in a fourfold division, and are known as Beacon Hill, Bridgeton, Pensauken, and Cape May formations. Clays and sands for brick, terra-cotta, and pottery, marls for fertilizer, glass sands, and gravel for road-building are dug in these formations.

In the northern part of the State there are surface formations of glacial epochs, and the terminal moraine of the last glacial ice is traced from Perth Amboy by Morristown and Hackensack to Belvidere on the Delaware.

Alluvial deposits of recent time are recognized in the river valleys and in the tidal marshes and in some of the fresh-water swamps.

Economic Geology.—To the early settlers the mineral wealth of the State was well known. Before the Revolution, copper, "bog" iron, brick clay, and glass sand were exploited. At the present time, the copper ores are not worked, owing to their low grade. Copper is distributed throughout the red sandstone zone. Of the iron-mining industry, the magnetic iron ores form the basis. In 1908 the production of pig iron amounted to 225,372 long tons, valued at \$3,370,000. In 1908 there were 17 blast furnaces in New Jersey, of which three were in blast and eight out.

The yearly output of zinc amounts to about 200,000 tons, ores being red oxide, silicate, and franklinite. The zinc deposits of Ogdenburg and Franklin Furnace in Sussex County are the most famous, although other localities where zinc blende occurs have been exploited, but have not been developed into mines. Lead in the form of galena has been mined in Sussex County. Arsenical and nickeliferous pyrites also occur. Graphite is disseminated widely in the crystalline schistose rocks of the Highlands. Molybdenum occurs in form of molybdic sulphide at the Ogden mines and at the Hude mine, Sussex County, but is not worked. Barite has been found in quantity for mining near Newton, Sussex County, and at Hopewell, Mercer County.

Clays are found throughout New Jersey. There are numerous beds of fire-clay, stoneware or potter's clay, and clay used in the manufacture of paper, terra-cotta, pipes, and bricks. The district at the mouth of the Raritan River produces, for its own establishments and more distant points, a vast tonnage of fire and ware clay. The large openings are near Woodbridge, Perth Amboy, Sand Hills, South Amboy, Sayreville, and Cheesequake. Clays for ware and for terra-cotta are obtained at various points, notably near Trenton and at Palmyra. Fire-clays are found along the line of the New Jersey Southern Railroad, large works being located at Winslow.

Brick-earth, or brick-clay, is found in thick beds along the Raritan River and Raritan Bay, along the Delaware, on the Hackensack, and there are very large brickyards on these navigable tidal waters, which make a large part of the brick used in structural work in New York

NEW JERSEY

and Philadelphia. Fire-sand, kaolin, and feldspar, as well as fire-clay, are also dug extensively in the Raritan clay district and put into fire-brick. In 1908 the value of the clay products of the state amounted to \$12,313,696. Brick and tile was valued at \$6,363,705 and pottery at \$5,949,991.

Of building stone, granite has been quarried at Charlottenburg in Morris County, and Pochuck Mountain, in Sussex County. Gneisses, for heavybridge work, are quarried at Dover. Sandstone quarries at Avondale, Newark, Paterson, Little Falls, Haledon, Stockton, and Greensburg, or Wilburtha, produce brownstone for cut work, while trap-rock, widely distributed and accessible to railroads and canals, has been most successfully used on State roads.

The marbles of the State are not at present worked, while slate for roofing has been quarried at the Delaware Water Gap, and at Newton and Lafayette in Sussex County. Flagging-stone quarries are opened near Deckertown, in Sussex County; at Milford, on the Delaware, and at Woodville in Mercer County. Portland cement is one of the important industries.

Agricultural Interests.—The staple crops produced in New Jersey are corn, wheat, rye, oats, buckwheat, hay, white and sweet potatoes. The values of these products for 1909 were as follows: corn, \$6,733,000; winter wheat, \$2,146,000; rye, \$1,018,000; oats, \$765,000; buckwheat, \$209,000; hay, \$9,009,000; potatoes, \$5,904,000. Of animals there are horses, mules, milch cows, other cattle and sheep. Horses are estimated to be valued at \$8,000,000, mules \$750,000, milch cows \$9,000,000, other cattle \$1,275,000, sheep \$200,000. The wool clipped in 1909 was about 176,000 pounds. The acreage under cultivation for 1909 is given as follows: corn, 220,000 acres; winter wheat, 110,000 acres; oats, 60,000 acres; rye, 79,000 acres; buckwheat, 13,000 acres; hay, 437,000 acres; potatoes, 80,000 acres.

Possessing a great diversity of soils, and a somewhat notable variation in temperature, New Jersey has ever occupied a distinctive position as an agricultural community. The average yearly temperature ranges from 49.6° in the Highlands to 53.0° on the sea coast. The average annual precipitation, including melted snow, is 47.18 inches in the Highlands, and 45.92 inches on the sea coast. Aside from the staple crops, above mentioned, the fruits of the State have a large sale in the nearby markets of Philadelphia and New York. Peaches and apples are extensively grown in the northern and northwestern portions of the State, while pears are cultivated in the midland counties. These fruits are common, however, in all sections. The southern counties produce large acreages of strawberries, raspberries and blackberries, while cranberries are a staple product of boggy areas in Burlington and Ocean counties. Grapes are grown extensively in the southern section of New Jersey, while plums, cherries, and currants are common in all sections. Huckleberries are of spontaneous growth and are gathered in large quantities. In truck farming, watermelons and cantaloupes, the Hackensack variety of the latter competing with the Colorado product, are grown on the large plantations and small farms near Philadelphia and New York. Market gardening, owing to the reasonable price of land, and extensive

stone-road system, and quick, cheap, and safe transportation by rail and boat, is a profitable industry in New Jersey, more particularly in the vicinity of New York. Commercial floriculture gives to the State a preeminence. Dairying is largely confined to the northern, central, and southwestern portions of the State. The poultry farms of New Jersey are near the markets of Philadelphia and New York. The forest lands, including stump and brush lands to merchantable timber, of the State occupy about 2,000,000 acres; the cleared farm land about the same acreage; 1,200,000 acres of forest land is coniferous, pitch pine on the uplands and white cedar in the swamps. This is the region known as the "Pines" extending from Lakewood on the north to Cape May County on the south, and embracing a number of health resorts. The northeastern Highlands, with 210,000 acres, the Kittatinny Mountain with 58,000 acres, the Palisade Mountain with 11,000, are the remaining large forest areas. The forest products are worth about \$4,000,000 annually. Owing to a lack of interest and knowledge, an inherited desire to denude the surface of the earth and almost constant fires during dry seasons, the forests of New Jersey have been neglected and rendered unproductive to the last degree. During the colonial period, forest lands were not only of a relative but actually of a greater value than they are at present. The State renders directly and indirectly great assistance to agricultural interests by the media of an agricultural college located in New Brunswick, experiment stations, a board of agriculture, grange and horticultural society. Reports, institutes, and lectures are the means of disseminating information.

Manufactures.—The great manufacturing districts of New Jersey are located in the immediate vicinity of New York and Philadelphia. Within the limits of the city of Newark alone it is claimed there are made a wider variety of articles than in any other city in the United States. Newark is famous for leather, jewelry, hats, and celluloid, Paterson for silks and locomotives, Passaic for woolen and worsted goods, Jersey City for tobacco products and soap, Trenton for pottery of all grades, structural steel and iron and rubber goods, Camden for shipbuilding and chemicals, Elizabeth for sew-

	No. of establishments	Persons employed	Capital invested

Silk	152	27,700	22,500,000

ing machines and shipbuilding, New Brunswick for hosiery, Perth Amboy and its vicinity for bricks and terra-cotta, Bridgeton, Millville, Vineland and smaller towns for glass. There are approximately 200,000 wage-earners in New Jersey, and the annual product of their labor is

NEW JERSEY

about \$400,000,000. From reports obtained for 1900, the data as shown in the foregoing table is presented in round figures as to the 11 great industries of New Jersey.

Of the other industries, outside those of an agricultural and manufacturing character, the oyster and fish industry is most conspicuous. From the mouth of the Raritan River to Sandy Hook, from Barnegat Bay to Cape May and thence in Delaware Bay to Salem, are about 15,000 acres of productive oyster beds. From the famous Maurice River oyster beds alone \$2,275,000 worth of these bivalves were shipped, exceeding in value the wheat crop of the State. From the Atlantic Ocean and Delaware Bay, vast quantities of clams, and fish of many kinds are sent to nearby markets. Shad and sturgeon, the latter furnishing caviare, are caught in Delaware Bay and river.

Transportation.—There are in New Jersey about 2,300 miles of railroad, with about 35,000 employees, whose duties are performed within the limits of the State. The railroad companies having trackage in the State are the Pennsylvania and the West Jersey and Sea Shore, representing about one third of the total miles of track. The remaining roads are the Central of New Jersey, Philadelphia and Reading, Erie, Delaware, Lackawanna and Western, New York, Susquehanna and Western, the Lehigh Valley and about 30 unclassified companies. Within the State are the two gateways, Jersey City and Camden leading to greater New York and Philadelphia. All of the above companies have terminal facilities in Jersey City, Weehawken and Hoboken. Every railroad entering New York city from the west and south, except the New York Central, now lands its passengers in New Jersey. There are nearly 1,000 miles of cable, electric and horse railroad in the State, a large percentage of the trackage being under the control of the Public Service Corporation. A practically continuous trolley service has been established between Jersey City and Camden, uniting Philadelphia and Greater New York. These roads have cost nearly \$150,000,000. In conjunction with the counties, townships, and cities and assessments upon abutting property owners, New Jersey has aided in the construction of 1,000 miles of good roads, penetrating every section of the State and usable at all seasons of the year. The canal systems of the State embrace the Delaware and Raritan, extending from Bordentown to New Brunswick, and the Morris, extending from Jersey City to Phillipsburg and uniting with the canal system of the commonwealth of Pennsylvania. The total mileage is 173.34.

State Institutions.—New Jersey has lately largely increased her activities in the matter of support of State institutions. That of a penal character is the State Prison located at Trenton. Those of a correctional character are the Reformatory for men and boys located near Rahway, the State Home for Girls near Trenton, and the State Home for Boys near Jamesburg. Those for dependents, defectives and delinquents are the State Hospitals for the Insane near Trenton and near Morristown, the Home for Feeble-minded Women and the Home for Feeble-minded Children (separate institutions) each located at Vineland, the State Village for Epileptics near Skillman and the School for

the Deaf at Trenton, the latter being under the control of the State Board of Education. These institutions are under the administration of separate boards appointed by the governor of the State. New Jersey has not yet adopted the plan of a general board of supervision or control. In matters of education, the State sustains a Normal and Model School at Trenton, the Farnum Preparatory School at Beverly, Manual Training and Industrial School for Colored Youth at Bordentown, agricultural college and experiment station, and teachers' institutes and libraries. Other functions assumed by the State are the preservation of fish, game and oysters, the care of the lives of employees in factories and workshops, an extensive geological survey, the preservation of historic sites, of the Palisades of the Hudson River and of public documents, the removal of children from such improper influences as poor-houses, the prospective care of tuberculosis patients. For her soldiers and sailors and their wives New Jersey has established homes at Kearney and Vineland.

Seaside Resorts.—The diversified scenery and climate of the State has led to the establishment of many resorts in all parts of New Jersey. Along the sea coast, Cape May has been noted as such for about a century, to be soon followed by Long Branch. Atlantic City has had in 1904 an organized existence of 50 years and represents, in growth and attractiveness, the most conspicuous example of municipal sea-shore development to be found in the world. Asbury Park and Ocean Grove were established about 1870. Within the last quarter of a century, practically every foot of beach front from Sandy Hook to Cape May has been subjected to a greater or less degree of development. Of the mountain resorts, one hotel property at Schooley's Mountain has entertained visitors for a century. Such lakes as Budd's, Hopatcong, and Greenwood are noted, while many hotels are to be found in the hilly country within easy access of New York. There are in the hills and mountains of the State, however, no communities devoted exclusively to furnishing amusement and health to visitors. In the "Pines" are a number of small resorts, all being overshadowed by Lakewood, the nearest point in the Pines accessible to Greater New York.

Education.—As early as 1662 a schoolmaster was settled among the Dutch land owners in what is now Jersey City; about 10 years later schools were erected in Newark, Woodbridge, Amboy, Elizabethtown, Freehold and Piscataway, while in 1683 the Society of Friends at Burlington set aside rents from an island in the Delaware, for the purposes of public education. In 1817, after nearly 20 years' agitation, the legislature created the first school fund. The management of the schools of the State is vested in a State Board of Education appointed by the governor. This board appoints superintendents for each of the 21 counties of the State. Although the Constitution requires that the State shall provide free instruction for all children between the ages of 5 and 18, the State has extended the age from 4 to 20. Courses in kindergarten and manual training have been extensively adopted, particularly in the large industrial centres.

The number of school-houses in the State is about 1,900, providing accommodations for

NEW JERSEY

1. Looking toward the Delaware Water Gap from Manunka Chunk.
2. Falls of the Passaic, Paterson.

NEW JERSEY

400,000 pupils. The value of the school property is \$28,582,358.

The report of the Superintendent of Education for 1908 showed an enrollment of 402,866, and an average daily attendance of 289,167. There were 10,279 teachers, of whom 9,173 were women employed at an average annual salary of \$697,006. The total receipts for public schools during 1908 were \$17,693,858 (including a balance of \$1,909,957 from 1907), and the expenditures \$14,951,775.

Of the many private schools in the State among the most conspicuous are Lawrenceville School (John C. Green Foundation), one of the most famous in the country, Princeton Preparatory School, Peddie Institute at Hightstown, Pennington Seminary, all in the county of Mercer. Other schools are St. Mary's Hall in Burlington, the West Jersey Academy and South Jersey Institute at Bridgeton, Newark Academy, Hasbrouck Institute at Jersey, Bordentown Military Academy, Blair Presbyterian Academy at Blairstown, Centenary Collegiate Institute at Hackettstown. There are theological institutions at New Brunswick, at Princeton, at Madison and at Newark. The three conspicuous colleges in the State are Princeton University, Rutgers College at New Brunswick and Stevens Institute of Technology at Hoboken. Princeton University ranks among the greatest universities in America. It has made the town of Princeton as famous as Cambridge, Mass.

Churches.—Throughout the colonial period of New Jersey three lines of religious activity were noticeable. In the eastern portion, the various phases of Calvinism were transplanted over-sea by the settlers. The Hollanders, the Scotch and many of the English emigrants, and the French Huguenots found a common bond of association in Calvinism. Ultimately Presbyterianism, outside of the sphere of Dutch influence, became dominant. In the western portion of the colony the Society of Friends held sway, with strength in Monmouth County, a part of the eastern portion. The Church of England never obtained a strong hold in the colony, its main congregations being at Burlington, Trenton, Perth Amboy, Elizabeth and Newark. During the middle part of the 18th century, Whitefield and Tennant, as Calvinists, and John Woolman, the apostle of the abolition movement in America, paved the way for future changes. Following the Revolution, the Methodist Episcopal Church, with its democratic teachings, recruited largely from the Society of Friends and from many of the Presbyterian congregations. With the coming of the Irish and German emigrants into New Jersey, in the period of extension of transportation systems (1830-60), the Roman Catholic Church made great advance.

Banks and Banking.—The State Legislature granted charters to two banks, one in Newark and one in Trenton in 1804. In 1812 a general banking law was passed for the protection of depositors, the law remaining in force until 1850, when other laws were passed. There were eight banks of issue in 1860. In 1868 there were 55 national banks in the State, 115 in 1900, and 124 in 1907. In the last named year there were 18 State banks. The Legislature established a department of banks and insurance in 1891, and

the banking law was again revised in 1899. Since 1880 New Jersey has been a favorite State for trust companies and for the organization of large corporations. Savings banks were first established in 1828. In 1876 a law was passed regulating these institutions. In 1910 the condition of the New Jersey banks was thus summarized:

	No.	Capital	Surplus
National banks.....	191	\$21,463,000	\$20,434,375
State banks.....	18	1,498,790	1,087,500
Mutual savings banks...	85	7,047,000
Trust companies.....	83	10,225,000	18,227,581

Finances.—The finances of the State are in most excellent condition, there being no bond issues for which interest and a sinking fund must be provided, nor is there a State tax levied. The total receipts of the State at the close of the fiscal year ending 31 Oct. 1909 amounted to \$8,637,221, and the total disbursements were \$7,774,615, leaving a balance 31 Oct. 1909 of \$3,680,082. The financial receipts of the State are largely derived from the tax on railroads and miscellaneous corporations which pay a large share of the total revenue. These figures show a steady increase in wealth and material prosperity. The cost of the State government has greatly increased in recent years, and in 1909 was approximately \$4,300,000 due to the growth of the State and extension of its activities. Other important sources of revenue are State fees from the offices of the clerks in chancery and supreme courts, the collateral inheritance tax, from the office of commissioner of banking and insurance, from the office of Secretary of State, from the State Prison and State Reformatory and from the oyster commission.

Population.—New Jersey began to obtain rapid growth in population about the year 1840; the absolute increase being the greatest in the decade from 1890 to 1900, due largely to the immigration of foreigners and the suburban New York population. The growth of population is given by the government census as follows: (1790) 184,139; (1820) 277,426; (1850) 489,555; (1860) 672,035; (1870) 906,096; (1880) 1,131,116; (1890) 1,444,933; (1900) 1,883,669. In 1900 there were 431,884 residents of foreign birth, one half of which number were German and Irish. In 1910 the population had increased to 2,537,167. There are 337 people to the square mile, and about 67 per cent of the population reside in 49 cities of over 4,000 population each.

The largest cities in the State with their population for 1910 and 1900 are as follows:

	1910	1900
Newark.....	347,469	248,070
Jersey City.....	267,779	206,433
Paterson.....	125,000	105,172
Trenton.....	96,815	72,307
Camden.....	94,538	75,035
Elizabeth.....	43,400	52,130
Hoboken.....	70,394	59,364
Bayonne.....	55,545	58,722
Passaic.....	54,773	27,727
Atlantic City.....	46,150	27,838
West Hoboken.....	35,403	21,004
East Orange.....	34,371	21,506

NEW JERSEY

Following is a list of the counties in New Jersey with their population for 1900 and 1910:

COUNTY	Square Miles	1900	1910
Atlantic	267	40,403	71,894
Bergen	236	78,441	138,002
Burlington	869	58,241	66,565
Camden	222	107,643	142,020
Cape May	256	13,301	10,745
Cumberland	511	51,103	55,153
Essex	127	359,051	512,886
Gloucester	326	21,005	17,368
Hudson	43	386,048	512,331
Hunterdon	437	34,507	35,500
Mercer	226	95,305	125,657
Middlesex	112	79,763	114,426
Monmouth	479	81,057	94,734
Morris	475	65,156	74,704
Ocean	581	19,747	21,118
Passaic	198	155,203	215,003
Salem	359	75,510	10,099
Somerset	305	32,048	38,820
Sussex	219	24,114	26,781
Union	103	90,153	140,197
Warren	363	37,781	43,187
Total	7,525	2,883,669	3,537,167

Government.—The general government of the State is administered under a Constitution adopted by the people in 1844, and in 1875 amended by a special election. Amendments to become a law, or a part of the Constitution, must receive the approval of the majority of the members of two consecutively chosen legislatures of the State, and must then be submitted to the people. A majority vote of the electors of the State is necessary for adoption. Five years is the time that must elapse between the submission of amendments to the people. Duly qualified voters are male citizens who have resided in the State one year, and in the county five months. The law requires the registration of voters. State elections are held annually on the Tuesday after the first Monday in November. The State has 10 representatives in the Lower House of Congress.

Legislature.—There are 21 State senators composing the Upper House of the Legislature, one from each county, and the term of office is three years. There are 60 members of the House of Representatives, elected from the counties on the basis of population. The term of office of a member of the Lower House is one year. Revenue bills originate in the Lower House.

Executive.—The governor is chosen by popular vote and for a term of three years. He cannot be re-elected without an intervening three years. He has power to call extra sessions of the Legislature, or of the Senate without the Representatives. He has the usual veto power which may be overruled by a majority vote of all the members of the Legislature. He grants pardons and reprieves in conjunction with the chancellor and six judges of errors and appeals. The state treasurer and comptroller are appointed for three years at a joint session of the Legislature. The governor, subject to the approval of the Senate, appoints for terms of five years the secretary of state, attorney-general, clerk of supreme court, clerk of the court of chancery, and keeper of the State prison.

Judiciary.—New Jersey has courts of law and courts of equity. The chancellor of the State and the judges of the supreme court are appointed by the governor, subject to approval

by the Senate, for terms of seven years. The courts are supreme court, county courts, orphans' court, and court of general quarter sessions of peace. The chancellor, the justices of the supreme court, and six judges specially appointed, constitute the court of errors and appeals. The Senate tries cases of impeachment.

Local Government.—The counties and towns are governed under general laws, and special laws cannot be passed unless by amendment of the Constitution. The justices of the peace are elected for five years by vote of the electors of the townships. The counties elect surrogates and clerks for terms of five years. The counties elect, also, sheriffs and coroners for three years, but such officers cannot be re-elected without an intervening three years. The cities and townships are required to have local boards of health.

History.—Based upon the conclusions reached by a group of scientists of international reputation, it may be stated that Man, known as "Glacial," "Argellite," and "Palaeolithic," resided within the limits of New Jersey, at the close of the Age of Ice. The proofs offered are the presence of non-intrusive stone implements, remains of extinct quadrupeds, used by primitive man as food, and human skulls and bones, all of which have been found in and near the city of Trenton. At this point, a large deposit of river wash, particularly sand and gravel, indicates that at one time the mouth of the Delaware River was directly south of Trenton. In the river wash the above mentioned evidences of human occupancy have been found. The culture point attained by these earliest inhabitants was probably that reached by Man in the Stone Age in Europe.

The Indians whom the Dutch and Swedes found in New Jersey were known as the Lenni-Lenape, members of the great Algonquin family. They were comparatively few in number, scattered in shifting communities along the river valleys and the sea coast. Less warlike than the Indians of New England or of Virginia, the Lenni-Lenape, later known as the Delawares, made some progress in agriculture and in the elementary arts. With the Dutch and Swedes, the Indians maintained comparatively peaceful relations, although a traders and settlers' war in the Raritan Valley, before the coming of the English, is a matter of record. After the English conquest of 1664, the Indian, although kindly treated by the Society of Friends in West Jersey, and tolerated by the Calvinists in East Jersey, could not withstand the effects of European civilization. Consumption, smallpox, venereal diseases, and alcoholism drove him down to the depths. Distrustful of the efforts made by the missionaries, his personal liberty restrained by legislation and social custom, the Indian was enslaved, and by intermarriage with the negro, lost his identity. In 1758, most of the New Jersey Indians were removed to the first reservation ever established within the limits of the present United States—that located at Edgepelick, Brotherton, or Indian Mills in the "Pines" of Burlington County. At the opening of the 19th century the Indians were removed to New York, and thence after various wanderings to Indian Territory. Lenni-Lenape of the full blood are now extinct in New Jersey.

Holland, politically and religiously free, and

NEW JERSEY

struggling with Sweden for supremacy as a world power, located upon Manhattan Island, her principal fort and trading post in the New World. Her navigators explored the coasts of New Jersey, and to one of the great rivers, the North, was given the name of Hudson. Cornelius Jacobsen Mëy sailed up the Delaware, then known as the South River, and commemorated himself by the name Cape May. By discovery and occupancy Holland laid claim to the soil of New Jersey. From New Amsterdam, farmers and traders established themselves in what is now Hudson and Bergen counties. By 1650 colonists had penetrated the river valleys emptying into all the waters of the Greater New York Harbor. Settlements were attempted on the Delaware. The efforts of the Dutch, in the colonization of New Jersey, were only successful in the northeastern portion of the State, where the church, speech, and lines of political thought of the fatherland firmly impressed themselves upon the community until recent years.

Gustavus Adolphus, in his scheme of Swedish colonization for North America, utterly disregarded the presence of the Dutch in New Jersey. For about 15 years after 1640, several groups of Swedish settlers occupied the valley of the Delaware, locating principally in the vicinity of Philadelphia. The communities of Swedes in New Jersey, isolated, and neglected by the home government and harassed by the Dutch, finally submitted, with their associates in Pennsylvania and Delaware, to the domination of Holland. From 1655 to 1664, New Jersey remained under the absolute control of Holland.

Recognizing the fact that Dutch control of the valleys of the Hudson and the Delaware separated New England from the southern colonies, Charles II., king of England, granted to his brother, James, Duke of York, a vast domain in North America, including much of what is now New England, New York, and New Jersey. An English naval expedition, in the summer of 1664, sent to New Amsterdam, secured the capitulation of the Dutch. To John, Lord Berkeley and Sir George Carteret, two faithful adherents of the House of Stuart during the Protectorate, the Duke of York made a transfer of what is practically the territory of New Jersey.

In recognition of Carteret's defense of the island of Jersey, against the Cromwellian forces, the Berkeley-Carteret grant was called *New Jersey*. The policy of the proprietors was to attract settlement, which was accomplished by exploiting the natural advantages of the colony, granting a liberal frame of government and providing for allotments of free or low-priced land. There was a very pronounced New England movement into the valleys of the Passaic and smaller streams, and by the introduction of social, political and religious views of the Congregationalists, the eastern portion of the colony became a partial reproduction of New England itself. Within a few years Berkeley disposed of his interests to a company largely composed of members of the Society of Friends. A partition being desirable, a line was run from Little Egg Harbor to a point near the Delaware Water Gap. Henceforth after 1676, begins the political history of East and West Jersey. To Carteret fell East Jersey; while West Jersey

became the property of the members of the Society of Friends. After 1676, the western portion of the State was open to English settlement, the dominant spirit being William Penn. The communities established in the Delaware river valley were isolated, and a plantation life, not unlike that of Virginia and Maryland, lacking certain religious characteristics, was developed. The county in West Jersey became the political unit, as the town became the political unit in East Jersey. Both the Jerseys passed later under the domination of Boards of Proprietors, who exercised broad governmental powers, and, until the present, held title to unoccupied lands. From 1664 to 1702, when both boards relinquished governmental rights to the Crown, there was a constant spirit of popular unrest, and one complete and one attempted change in government. In 1673 New Jersey was recaptured and occupied for a few months by the Dutch. When James, Duke of York, became King James II., he endeavored, by means of Sir Edmund Andros, to upset the proprietary governments, the matter not being finally settled, favorably to the proprietors, until 1681. In the meantime, internal disturbances growing out of quit-rent agitations, affected the peace of the two proprietaries. The period from 1702 to the outbreak of the American Revolution was undisturbed by any dramatic incidents. The growth of Philadelphia and New York, as commercial centres, tended to develop the agricultural interests of New Jersey. As early as 1710 the tendency to draw the active forces of the colony into the two cities was apparent, leading to Benjamin Franklin's famous aphorism, uttered soon thereafter, that New Jersey was like a cider barrel, tapped at both ends. The usual colonial quarrels between the Crown officers and the popular branch of the legislature were reflected in New Jersey, as elsewhere. Landed interests dominated the governor's council, small property owners were disfranchised, business enterprises were restricted, if not prohibited, by legislation in Parliament, and by taxation, commerce on the high seas was suppressed by the Navigation acts, metallic currency was withdrawn from the colony,—a score of causes, mainly economic, operated to produce the resort to arms.

While loyal to the Crown, there were, nevertheless, mutterings of discontent, of ill-concealed defiance of law officers and a spirit of restlessness, restrained by the wave of patriotism evoked by the French and Indian war, but which swept on with increasing force after the opening of the year 1770. The most notable events of this period, from 1702 to 1775, were the suppression of piracy in the vicinity of New York and Cape May; the establishment of a continuous land and water route from Philadelphia and New York; the erection of ferries and post roads; the appearance, in the northern, central and western parts of the colony, of Huguenot, Scotch-Irish and Palatinate emigrants; the chartering of Princeton University and Rutgers College; the establishment of the first Indian reservation in the United States in Burlington County, the religious revival of George Whitefield, and the promulgation of John Woolman's abolition doctrine; the massacres by the Indians in Sussex County, and the erection of a series of barracks, owing to their need in the French and Indian war, in various parts of the State. The open-

ing of the American Revolution found New Jersey divided in sentiment. The Calvinistic element, represented so largely in East Jersey, took the initiative. The spirit of war, as in New England, appeared in the town meeting. The professional classes, the members of the Society of Friends, and the large merchants were either opposed to war or were non-combatants. A minority awaited the results of agitation. The strength of the element loyal to the home government may be shown from the fact that upon 2 July 1776, when New Jersey asserted her statehood, the Constitution contained a proviso that the document should not be operative in case of a reconciliation between England and New Jersey. William Franklin, the last colonial governor of New Jersey, remained loyal to the Crown, and, banished from New Jersey, sought refuge among Tory sympathizers in New York city, becoming the adviser of those planning movements of Tory invaders in the State. Largely conducted in the northern central portion of New Jersey, under the control of Crown sympathizers, these raiders gained the name of "Pine Robbers." During the Revolution, nearly 100 battles and skirmishes were fought upon the soil of the State. Most conspicuous were the battles of Trenton (26 Dec. 1776), Princeton (3 Jan. 1777), Red Bank (22 Oct. 1777), Monmouth (28 June 1778), and Paulus Hook (19 Aug. 1779). Among minor engagements of importance were the fights at Bound Brook (13 April 1777), Egg Harbor (15 Oct. 1778), Hancock's Bridge (21 March 1778), Tom's River (24 March 1782), the burning of Bordentown (8 May 1778), and no less than a score of engagements in and around Elizabeth and Newark and nearby territory. During the war occurred the "retreat across the Jerseys" and Washington's two winter occupations of Morristown. At the close of the war, New Jersey was sadly impoverished. Her spirit was distinctively Federal. She participated in the Annapolis Convention, her representatives advocated the "New Jersey plan" at Philadelphia, in the framing of the Federal Constitution, which she adopted without a dissenting voice. With the opening of the 19th century, New Jersey became a political storm-centre. As a Federalist leader, Alexander Hamilton had wielded a powerful influence in the State. He had been active in the establishment of the Society for the Improvement of Useful Manufactures, out of which grew the city of Paterson, and had urged the development of Paulus Hook (the site of Jersey City). He was closely allied with the Federal elements until then in control of New Jersey politics. Arrayed against him was Aaron Burr, son of the Rev. Aaron Burr, sometime President of the College of New Jersey, now Princeton University. The end of the antagonism between Burr and Hamilton came in a duel fought in 1804, at Weehawken, New Jersey. The activities in politics were reflected in industrial life. Before the second war with England, a chain of State banks was established, bridges crossed the rivers between Philadelphia and New York, steamboats were to be found upon the Delaware and Hudson rivers, highways were extended to every accessible part of the State, and the development of water-power led to the establishment of many small factories. The second war with England blighted the prospects

of growth. Although no engagements occurred upon her soil, New Jersey, as much for the protection of Philadelphia and New York, as for her own interest, furnished militia to garrison forts on the Delaware and at Sandy Hook. The position of the State led to overland transportation of military supplies between the North and South, for the reason that the Atlantic seaboard was blockaded by British fleets. From this condition and owing to the demand for good roads, the first railroad charter ever granted in the United States passed the Legislature in the year 1815. Thus, in connection with the revival of agitation concerning internal waterways, led to the constructing of the Camden and Amboy railroad and the Delaware and Raritan canal, now a part of the standard lines of the Pennsylvania Railroad system across the State of New Jersey.

The development of the industrial era, following the close of the War of 1812, broken by the panics of 1817, 1837, and 1857, marked the growth of Newark, Jersey City, Paterson, Elizabeth, New Brunswick, Trenton, and Camden. The period of social unrest characteristic of Jacksonian dominance in politics led to the adoption of a new State constitution in 1844, pronounced reforms of a penalological and charitable character, the extension of the public school system and the growth of railroads. The Civil War found New Jersey ready to respond to the call for troops. To the cause of the Union she furnished 88,305 men, or within 10,501 of her entire militia, and for the organization, subsisting, supplying, supporting and transporting her troops she paid nearly \$3,000,000. Following the war came a period of prosperity. The agricultural advantages of the southern portion of the State, first practically promoted at Vineland and latterly fully disclosed by the success of the Jewish settlement at Woodbine, revolutionized a large area south of Camden. The overplus of population of Philadelphia and New York sought permanent and temporary homes in New Jersey, while the industrial centres of the northern and eastern portions of the State grew with unprecedented rapidity. The present prosperity of the State is largely due to the changes which have occurred in the last three decades.

NEW JERSEY—NEW JERUSALEM CHURCH

New Jersey, College of. See PRINCETON UNIVERSITY.

New Jersey Foreigners, in American humor, an allusion to New Jersey as a foreign country, and to New Jerseymen as foreigners; a saying handed down from the time when Joseph Bonaparte, ex-king of Spain and Naples, after the downfall of Napoleon, sought an asylum in the United States. As an alien he was obliged to obtain a special act of Legislature to enable him to hold real estate. Pennsylvania refused, but New Jersey consented, and he established himself in princely magnificence at Bordentown. Hence men of other States used to declare that the Jerseymen, with their foreign prince, were foreigners.

New Jersey Plan, in American history, a plan for a Federal Constitution proposed at the Convention of 1787 by William Paterson, of New Jersey. The resolution provided for the enlargement and correction of the Articles of Confederation; that Congress should remain a single body, and should regulate taxation and commerce, and should choose the executive; that requisitions from States should be continued; that a judiciary should be established; that naturalization should be uniform; that the executive should coerce refractory States or individuals, and other provisions of less importance. This plan was unfavorably reported from the committee to whom it was referred.

New Jersey Tea. See CRAWFORDS.

New Jerusalem, je-roo'sa-lém, the name given by the Apostle John in the Book of Revelation to heaven.

New Jerusalem Church, The. The Church called the New Jerusalem derives its name from the Apocalypse or Revelation of John, chapter xxi. 1 et seq. The doctrines of this Church are set forth in the theological writings of Emanuel Swedenborg (q.v.), who is recognized by the members of the Church as a divinely illumined seer and revelator. The New Jerusalem, or The New Church, as it is denominated throughout Swedenborg's writings, is a spiritual city, not a natural and material city. A spiritual city is the home and abiding place of man's heart and mind, of his love and his faith, therefore such a spiritual city or home is properly called a Church. The New Church now being established among men on the earth is what is meant by the descent of the Holy City, the New Jerusalem. But a Church is a Church from its love and its faith, not from the membership of its organization, hence the New Church must be viewed in the light of its doctrines which present the nature and quality of its love in the form of its faith.

The faith of the New Church is as follows: The Lord Jesus Christ is God himself, the one only God of the universe,—the creator, the redeemer, the regenerator, and the saviour. God in the Old Testament is called most commonly Jehovah (The Lord in A. V.), a Hebrew word signifying *The Being*, "I am Who I am," the self-existent and eternal, from whom all things are, thus who is all in all things of his creation. God in the New Testament is called Lord, Jesus Christ, Father, Son, and Holy Spirit, besides other names. Since the Word is God's revelation and expression of himself, the differ-

ent names by which he is denominated therein distinguish his essence and existence, his love and wisdom and power. They define and qualify his nature and disposition, his ends, his methods and his acts. By the Father, therefore, is not meant a divine being or person separate and apart from other divine persons called the Son and the Holy Spirit, but the Father signifies the divine inmost, the divine esse, the divine love; the Son signifies the divine exstere, the divine appearing, divine revelation, divine truth, the divine word, the Divine Human. The Holy Spirit signifies the divine proceeding, the divine operation, the divine influx, adapting and appropriating to man the divine life of love and truth. Thus the Trinity as understood in the New Church is not involved with an idea of three Gods, but it is distinctly taught in the doctrines of this Church that there is a Trine in God, our Lord Jesus Christ, of love, wisdom, and power. To this Trine he referred when he "spoke in parables" of the Father, Son, and Holy Spirit. It is believed that now is the consummation of the age or the last time of the Church—the end of the world, as translated in the Authorized Version.

The consummation of the age or the last time of the Christian Church is predicted in the Evangelists and in Daniel. (See Matt. xxiv. 15, 18, 21, 22, 28; xxviii. 20; Luke xvii. 34; John ix. 4; I. 4 et seq.; viii. 12; xii. 35, 36, 40; Daniel ix. 27.)

This consummation does not mean a literal and visible destruction of the natural world at the "Last Day," but the end of the former ecclesiasticism as a Church in the true sense of the word; that is to say, where genuine charity or love prevails in conjunction with a living faith. That the Christian world to-day is not permeated nor dominated by the principles of human life as taught by Jesus Christ and evangelized by his apostles is one of the evidences and confirmations of the teachings of the New Church, that now is "the end of the world," the consummation of the age, the Lord's second coming and the establishment of a new church by him. The last judgment also has been accomplished, primarily and completely, throughout the spiritual world whither all souls depart at death, but in the natural world the effects of the judgment appear gradually, by little and little, in the changes which have come to pass. Among the most conspicuous of such results is the greater freedom of thought and speech in respect to both spiritual and natural things, and hence a more universal breadth of view and tolerance of opinion.

But these signs of the times are only certain effects, visible to common observation, of the second coming of the Lord and his establishment then of the New Jerusalem.

Swedenborg declares ("The True Christian Religion," No. 772) that this second coming of the Lord is to separate the evil from the good, so that those may be saved who have believed and do believe in him; and to form from them a new angelic heaven and a new Church on earth, otherwise no flesh could be saved (Matt. xxiv. 22).

This work of separation was accomplished in the spiritual world in 1757 upon all who had died since the Lord's first coming in the flesh. The separation of the evil from the good, their

NEW JERUSALEM CHURCH

judgment to hell and the elevation, at the same time, of the good to heaven is what is meant by the Last Judgment, and Swedenborg, having witnessed it, describes the event in a work called 'The Last Judgment.'

Since the Lord, when upon earth, glorified his human nature by making it divine and uniting it to the divine from which it was begotten, therefore this second coming must be an appearing and revelation of the Lord God in his divine-human nature, or, as it is called throughout Swedenborg's writings, the Divine Human.

This Divine Human, invisible to man's natural sight in this world, is manifest clearly in the spiritual world to man's spiritual vision, which everyone enjoys immediately after death. But in order that the second coming might be announced and made known throughout the world as well as among angels and spirits, it was necessary that some man should be chosen and prepared to live consciously in both worlds at the same time in order to see and hear the things transacting in the spiritual world and then to narrate and describe them in natural language for man upon earth.

As such a seer and revelator Emanuel Swedenborg solemnly asseverates he was especially prepared and appointed to be. In 'The True Christian Religion,' No. 771, he says: 'Lest the man of the New Church, like the man of the Old Church, should wander in the shade, in which the sense of the letter of the Word is, especially concerning heaven and hell, and concerning his life after death, and concerning the coming of the Lord, it has pleased the Lord to open the sight of my spirit, and thus to let me into the spiritual world; and not only to give me to speak with spirits and angels and with relations and friends, but with kings and princes, who have departed from the natural world; and also to see the stupendous things of heaven, and the miserable things of hell; and thus that man does not live after death in some unknown place of the earth, nor fly about blind and dumb in the air, or in empty space; but that he lives as man in a substantial body, in a much more perfect state, if he comes among the blessed, than before, when he lived in the material body. Therefore, lest man should become more deeply grounded in the opinion respecting the destruction of the visible heaven and the habitable earth, and thus respecting the spiritual world, from ignorance, which is the source of naturalism, and then, at the same time, atheism, which, at this day, among the learned has begun to take root in the interior rational mind, should, like a mortification in the flesh, spread itself around more widely, even into his external mind, from which he speaks, it has been enjoined upon me by the Lord to promulgate some of the things seen and heard, both respecting heaven and hell, and respecting the last judgment; and also to explain the apocalypse, where the coming of the Lord, and the former heaven, and the new heaven, and the holy Jerusalem, are treated of; from which, when read and understood, any one may see what is meant there by the coming of the Lord, and by the New Heaven, and by the New Jerusalem.'

'This second coming of the Lord is effected by means of a man, before whom he has manifested himself, and whom he has filled with his

spirit, to teach the doctrines of the New Church through the word from him.'

'Since the Lord cannot manifest himself in person, and yet has foretold that he would come and establish a new Church, which is the New Jerusalem, it follows that he is to do it by means of a man, who is able not only to receive the doctrines of this Church with his understanding, but also to publish them by the press. That the Lord has manifested himself before me, his servant, and sent me on this office, and that, after this, he opened the sight of my spirit, and thus let me into the spiritual world, and gave me to see the heavens and the hells, and also to speak with angels and spirits, and this now for many years, I testify in truth; and also that, from the first day of that call, I have not received anything that pertains to the doctrines of that Church from any angel, but from the Lord alone while I was reading the Word.' (T. C. R. 779.)

Such plain statements as these, and there are very many more like them throughout his writings, to the New Churchman, define Swedenborg's office and place in the world among men and give to all his theological books the stamp and seal of divine authority.

In 'Heaven and Hell' (No. 1) Swedenborg declares that his writings are an immediate revelation from God the Lord Jesus Christ, and constitute his second coming. It is, therefore, believed in the New Church that the doctrines revealed through Swedenborg are the divine Word itself, although in quite a different form from the 'Sacred Scriptures,' but the Word is not God's communication of himself to man by virtue of its form, but because of the divine truth which reveals itself in such a manner, the truth really making its own form of manifesting itself.

Throughout his writings Swedenborg shows that the divine word has an internal sense within the literal sense, this internal sense being the very Word itself, its essence, its glory, and its life. This sense, indeed, Swedenborg declared to be disclosed solely by means of his writings. Within the New Church it is believed, therefore, that the writings of Swedenborg are the Lord in his second coming in his divine humanity, and thus the very Word itself in its spiritual sense set forth in a rational and philosophic form.

In America there are two general organizations of those who receive the testimony of Swedenborg and acknowledge his writings to be divine revelation. One, 'The General Convention of The New Jerusalem,' dating from 1817; the other, 'The General Church of the New Jerusalem,' holding its first 'General Assembly' in June 1897. The representative organ of the former is 'The New Church Messenger.' 'The General Church' is represented by 'The New Church Life.'

The 'Convention's' theological school is located at Cambridge, Mass. At Bryn Athyn, Penn., is a settlement of New Church families devoted especially to the work of education in accordance with the principles of instruction and the formation of character as set forth in the new revelation. 'The Academy of the New Church,' now well established there, is a corporation instituted for the purpose of conducting a universal system

NEW KENSINGTON—NEW MADRID

of schools wherein shall be taught the doctrine and religion of the Church, as well as every useful science and art. The end and aim of the Academy is to educate its pupils, not only for a life of efficiency in the natural world, but pre-eminently to prepare them to become most useful inhabitants and citizens of the spiritual world in the life after death. The influence of this organization, dating its beginning from 1876, has been incalculable and far-reaching, extending throughout the borders of the Church. By its profound study and learning in the doctrines of the Church it has set up a standard of interpretation of the writings of Swedenborg, and by its attitude of loyalty and faithfulness has exalted them within the Church into a position of supreme authority and power.

Besides these bodies of the Church in America and Canada, and the General Conference in Great Britain, there are societies in Europe and Australia, most of them being united to or affiliated with one or other of the general churches in the United States or Great Britain. The Swedenborg Scientific Association was organized 27 May 1898 by members of the New Church. For a more extended notice of this body see SWEDENBORG.

RICHARD H. KREP,

Pastor Church of the New Jerusalem, Atlanta, Ga.

New Ken'sington, Pa., borough, in Westmoreland County; on the Allegheny River, and on a division of the Pennsylvania railroad; about 15 miles northeast of Pittsburgh. It is in a region noted for the manufacture of iron and steel. Its chief manufactures are steel and iron products, flour, lumber, brick, beer, and furniture. The glass and white lead works in the vicinity contribute to the industrial prosperity of the borough. Pop. (1910) 7,707.

New Leinster, lén'ster, or lín'ster. See STEWART ISLAND.

New Lexington, lēk'sing-ton, Ohio, village, county-seat of Perry County; on the Cincinnati & M. V., and the Toledo & O. C. R. R.'s; about 50 miles east by south of Columbus. It is in an agricultural section, and in the vicinity are coal fields and deposits of fire clay. The manufactures are chiefly brick and other clay products. There is considerable trade in farm products, brick, clay, and coal. It is the seat of Saint Aloysius Academy. Pop. (1890) 1,470; (1900) 1,701; (1910) 2,559.

New Light, a fish. See CHAFFER.

New Light and Old Light, the names generally used to designate the two parties in the Presbyterian Church whose difference of opinion in regard to the power of the civil magistrate in matters of religion caused the disruption of the

Associate Synods of Scotland in the latter part of the 18th and the beginning of the 19th centuries. The terms were again used for the two parties in the similar controversy in the Reformed Presbyterian Church in the United States, which caused the division of that body in 1833. See PRESBYTERIAN CHURCH.

New Lisbon, or Lisbon, Ohio. See LISBON.

New Lon'don, Conn., city, port of entry, one of the county-seats of New London County; on the Thames River, and on the Central V., and the New York, N. H. & H. R.R.'s; about three miles from Long Island Sound and 50 miles in direct line southeast of Hartford. It has regular steamer connection with New York and all the Sound ports. Its fine harbor is protected by Forts Griswold and Trumbull.

In 1646 John Winthrop, the younger, founded Naumeg, and in 1658 the name was changed to New London. Prior to the Revolution it was of considerable commercial importance and had established trade with the coast towns of the nearby colonies and with the West Indies. During the war it suffered from attacks by the British. On 6 Sept. 1781 a British force under command of Benedict Arnold attacked the town, destroyed the wharves and many of the buildings, and killed a number of the people. In memory of this attack, a shaft 127 feet high has been erected at the place (see GORON) where the massacre occurred. The town was incorporated in 1784. The first session of the Catholic Summer School of America (q.v.) was held in New London.

New London has a number of large manufacturing establishments, chief of which are machine shops, foundries, printing-press works, silk-mills, cotton-gin factory, woolen mills, bed-quilt factory, furniture factory, and ship-yards. Sealing and whaling continue to be of importance, and a considerable amount of farm products are exported. It is a distributing centre for a large amount of the imports used in the southeastern part of the State. Some of the historic places of interest are the Old Town Mill, built in 1646, the school house where Nathan Hale was once a teacher, and the Hempstead House. A government naval station is on the river outside the city limits. It has public and parish schools, the New London County Historical Society and Library, and a public library. The government is administered under a charter of 1894 which provides for a mayor, who holds office three years, and a council. The school board is chosen by popular vote. Pop. (1900) 17,548; (1910) 19,659. Consult: 'Historic New London,' in 'New England Magazine,' Vol. V; Caulkins, 'History of New London'; Starr, 'Centennial Sketch of New London.'

New Mad'rid, Mo., city, county-seat of New Madrid County; on the Mississippi River, and on the Saint Louis Southwestern railroad; about 130 miles in direct line south by east of Saint Louis and about 50 miles below Cairo, Ill. It has regular steamboat connection with all the river ports. It was settled by Americans in 1788, when the Spanish owned east of the Mississippi. During the Civil War it was used as a Confederate station until 13 March 1862, when it was abandoned and became a Federal possession. It is situated in a productive agricultural region in which the principal crops are cotton, grain, and fruit. It has extensive lum-

NEW MARKET—NEW MEXICO

ber interests. The trade is chiefly in lumber, grain, fruit, live-stock, and cotton. Pop. (est.) 1,700.

New Market, Battle of. In co-operation with Gen. Grant's Wilderness campaign and the movements of Gen. Crook, who was marching from West Virginia on Staunton, Va., Gen. Sigel, commanding the Union forces in the Shenandoah Valley, on 9 May 1864, marched from Martinsburg up the Valley pike with Gen. Sullivan's division of infantry, Gen. Stahel's division of cavalry, and five batteries of artillery, in all about 6,500 men and 28 guns. He arrived at Woodstock on the 11th, his cavalry pushing on to Mount Jackson, where, on the 14th, it encountered some of Imboden's cavalry, forced it across the Shenandoah, and followed as far as New Market. Col. Moor with parts of Sullivan's division and cavalry, joined the advanced cavalry at New Market late in the evening, and a skirmish ensued, in which artillery was used. Twice during the night strong demonstrations were made on Moor, which he repulsed. Gen. Breckinridge, commanding the Confederate troops in the valley, hearing of Sigel's advance, had collected at Staunton a force of 5,000 men, including the cadets of the Virginia Military Institute, with eight guns, and at daylight of the 15th drew up two miles south of New Market to give battle. Moor had, beside 300 cavalry and two guns, two regiments of his own brigade and two of Col. Thoburn's. Stahel came up in the morning and took command, and as it neared noon Sigel arrived with the rest of his army, and made disposition for battle. Moor was left in his advanced position, with his own two regiments and a small body of cavalry to hold Breckinridge in check, until Sigel could complete his dispositions, which were well made. Thoburn's brigade constituted the main line, along which were the batteries. The cavalry was behind the centre and on the left flank. The line extended across the pike on rising ground, another slope in front being held by Moor, Breckinridge formed line with Echols' brigade on the right and Wharton's on the left, the Institute Cadets and the 6th Virginia between the two. Imboden's cavalry and a six-gun battery were on the extreme right. McLaughlin's artillery occupied a sharp ridge left of and parallel to the pike and opened furiously upon Sigel's guns, which as furiously responded. Breckinridge advanced, and Moor, being overlapped on both flanks, fell back in some disorder, and Breckinridge, without pausing, pressed on and attacked Thoburn, who, charging from his right, checked him, Sigel's guns using shell and canister with great effect. Meanwhile Imboden crossed Smith's Creek and, moving down its east bank, gained the top of a small hill opposite Sigel's left, placed his guns on it, and at short range opened a rapid fire upon Sigel's massed cavalry, which immediately fell back, and Sigel ordered his entire line to fall back half a mile. Imboden's guns were now turned on the flank of the infantry, Breckinridge pressed on in front, and the contest was desperate and at close quarters, Von Kleiser's battery being particularly destructive to the centre of Breckinridge's line held by the Cadets. An order to charge the battery was given, the Cadets and the 6th Virginia went forward in fine style, and with great loss captured the battery; the rest of the line advanced, and

Sigel retreated, followed a short distance by Breckinridge. At Rude's Hill, nearly three miles from the field, Sigel halted and formed line; Breckinridge soon came up; there was an exchange of artillery firing; and at 7 P.M. Sigel abandoned Rude's Hill, crossed the Shenandoah, burned the bridge, and continued his retreat down the valley to Cedar Creek, which was reached early in the morning of the 17th. The Union loss was 93 killed, 552 wounded, and 186 missing. The Confederate loss was 42 killed, 522 wounded, and 13 missing. Consult: 'Official Records,' Vol. XXXVII.; Pond, 'The Shenandoah Valley in 1864'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.; Wise, 'The Battle of New Market.'

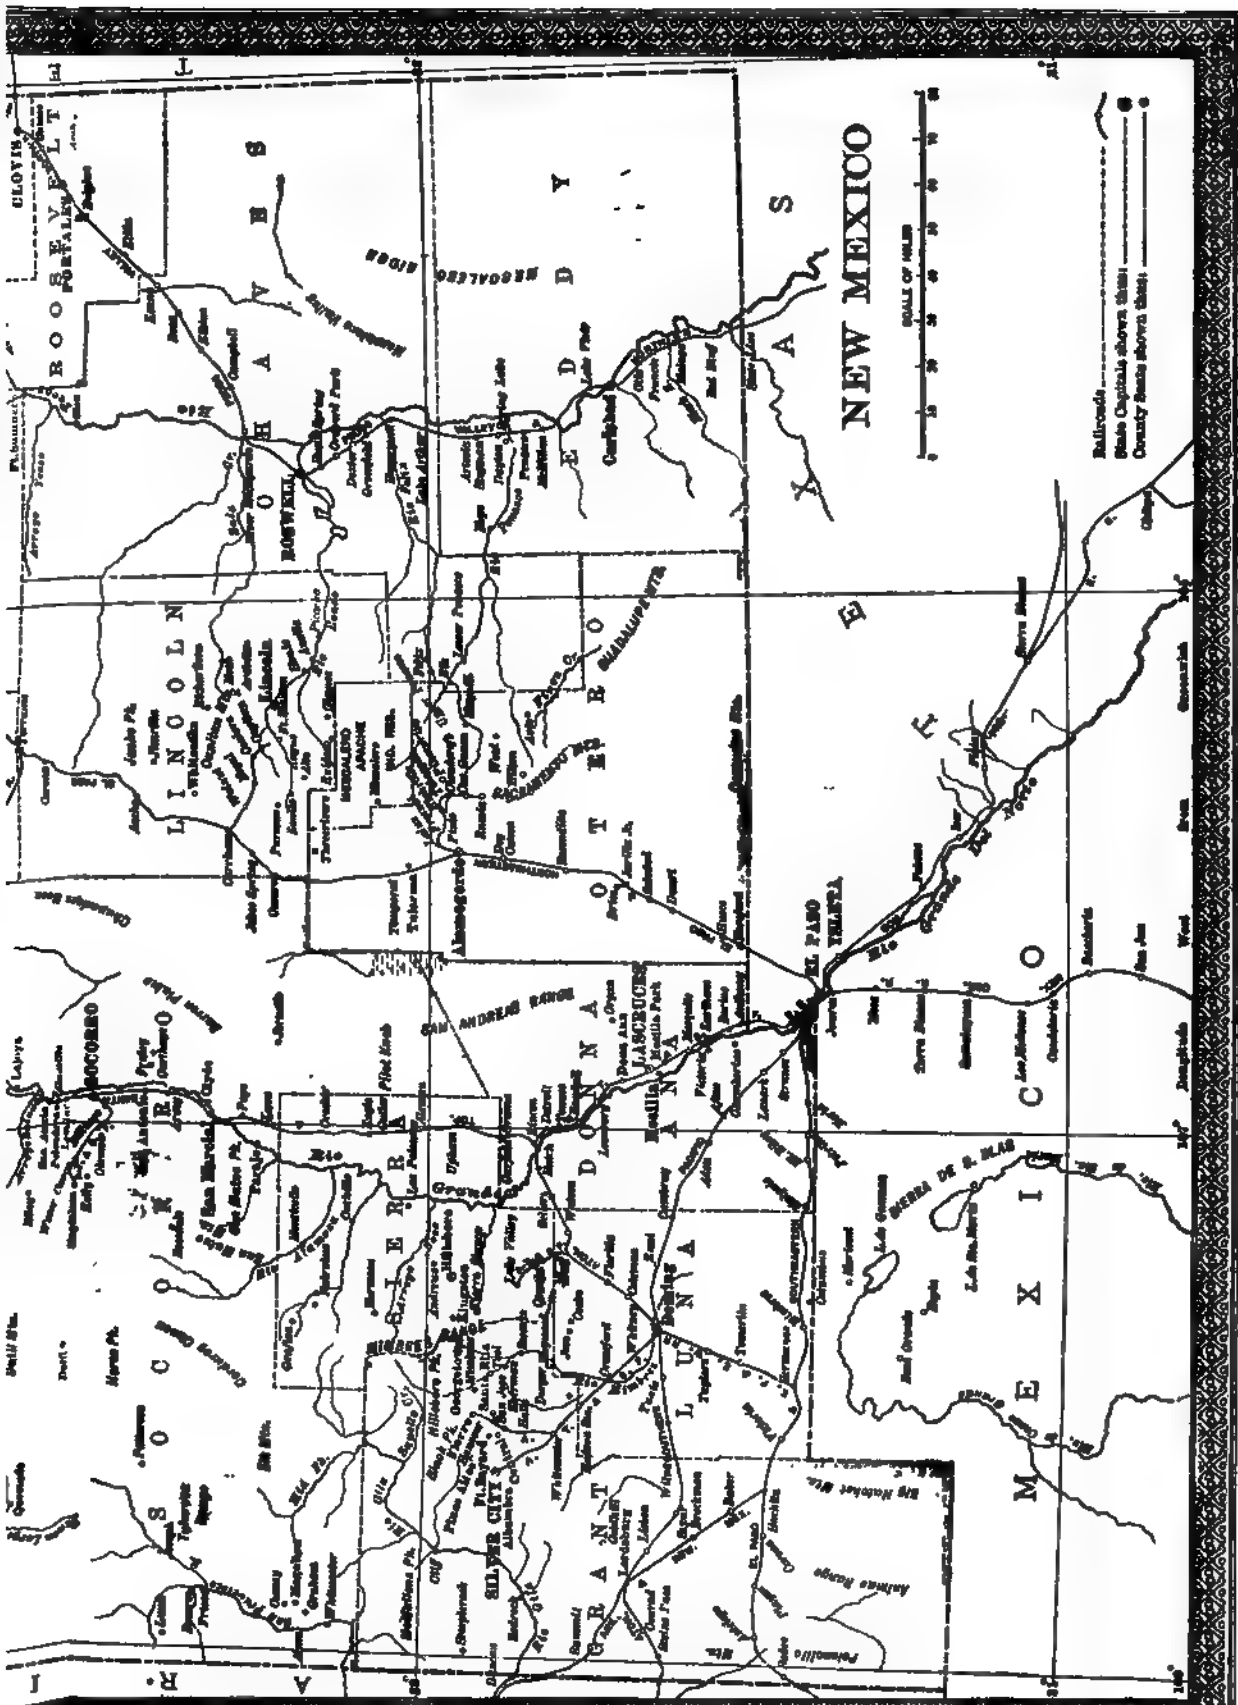

E. A. CARMAN.

New Mecklenburg, mēk'lēn-bērg, formerly **NEW IRELAND**, the second largest island of the Bismarck Archipelago (q.v.) to the northeast of New Pomerania, from which it is separated by Saint George Channel. It has an estimated area of nearly 5,000 square miles; with the exception of a small European trading station on the north coast it is inhabited by wild Papuan tribes.

New Mexico, a State of the United States admitted Aug. 21, 1911, between lat. 31° 20' and 37° N., and lon. 103° and 109° 2' W.; bounded on the north by Colorado, on the east by Oklahoma and Texas, on the south by Texas and Mexico, and on the west by Arizona. Area, 122,450 square miles (78,374,400 acres), of which two thirds are public lands. Organized 25 Nov. 1890, under act of 9 Sept. 1850. Pop. (1890) 153,593; (1910) 327,301, or about 2.7 to the square mile. Capital, Santa Fé.

Topography—New Mexico occupies a lofty plateau which reaches its greatest elevation in the north and west and slopes to the south and to the southeast, where lies the western part of the Llano Estacado, or staked plain, so part of the plateau being less than 3,000 feet above sea-level. The altitude of Santa Fé, in the north, is 6,998 feet, that of Albuquerque on the Rio Grande, near the middle of the Territory, 5,008 feet, while Carlsbad (formerly Eddy), on the Rio Pecos, is 3,122 feet. From the vast table-land, both east and west of the Rio Grande, rise numerous sierras and more or less isolated peaks belonging to the Rocky Mountain system. The Sangre de Cristo range of Colorado extends southward into New Mexico to lat. 35° 30', the various component ridges being the Culebra, Cimarron, Taos, Santa Fé, Mora, Las Vegas, Raton, etc. The principal peaks are Cerro Blanco (14,269), Truchas (13,150), Taos (13,145), Costilla (12,634), Baldy (12,623), Lake (12,380), and Mora (12,020). Southward from these and extending eastward are numerous isolated sierras—the Sandia, Manzano, Gallinas, Jicarilla, Caballo, Oscuro, San Andres, Organ, Blanca, Capitan, Sacramento, Hueco, Guadalupe, and many lesser mountains. West of the Rio Grande and within its immediate drainage is another broken sierra, extending southward from the Colorado line, its principal component groups being the Petaca, Valles, Gallinas, Nacimiento, Jemez, San Mateo, Magdalena, Socorro, Black, Mimbres, Florida, and Potrillo mountains. In the northwest the Carrizo, Tunicha, and Choiska mountains, forming

NEW MEXICO

part of the continental divide, extend into the Territory from Arizona, as do the San Francisco and Peloncillo ranges in the southwest; while lying between the western boundary and the mountains of the Rio Grande area are the Zuni, Datil, Little Diablo, Black, Tularosa, Mogollon, Pinos, Burro, Pyramid, Big Hatchet, Hacheta, and Animas ranges, with many others of lesser note.

Rivers.—The streams of northeastern, eastern, and central New Mexico flow into the Mississippi and the Gulf of Mexico, while those of the western portion empty into the Gulf of California. The largest river is the Rio Grande, which flows generally southwesterly from the Colorado boundary to lat. 33°, then southeasterly across the Mexican line. This river has several unimportant tributaries within the Territory—the Chama, Jemez, and Rio Puerco from the west and several of even less significance from the east. The Pecos has its source in the Las Vegas Mountains, flows southeasterly, then generally southward, almost paralleling the western escarpment of the staked plain, and southeasterly across the Texas border, finally joining the Rio Grande. The Canadian, with its several headstreams, drains northeastern New Mexico and passes out of the Territory in lat. 35° 25', forming a branch of the Arkansas. The western part is drained entirely by headwaters of the Colorado—the San Juan, the Zuni, and the Gila. The Rio Mimbres, which heads in the Florida Mountains, is, like all except the largest streams, non-perennial, and indeed even the channel of the lower Rio Grande is frequently dry.

Forests.—Several of the mountain ranges, particularly those of the north and in Lincoln and western Socorro, Grant, and McKinley counties, are covered with timber, the most valuable being pine, although oak, juniper, cedar, birch, maple, and other trees are common. The Pecos River, Lincoln, and Gila River forest areas have been reserved by the United States, but grazing of cattle is allowed under certain conditions. Piñon and cedar are abundant in the foot-hills throughout the Territory; mesquite is found in the southeastern part, east of the Pecos, while the saguaro or giant cactus forms a feature of the landscape in the southern and southwestern parts, where there are also groves of oak and walnut. Along all the water-courses cottonwoods are abundant, and occasionally willows and sycamores are found. Yucca, the roots of which are used as a substitute for soap, is everywhere abundant.

Agriculture.—In many of the valleys and mountain ranges (where the latter are not of exposed basalt) are nutritious grasses—at least 14 varieties, mostly gramma, being found—affording fairly abundant food for the large flocks and herds. Bear, deer, mountain lions, wildcats, and antelope elk are found in the mountains, and rabbits, hares, coyotes, and prairie-dogs are common in the plains. The valley lands are fertile, but as the Territory lies within the arid region, agriculture is conducted largely through irrigation, the irrigated farms forming 74.1 per cent. Much of the water diverted from the streams is wasted by crude methods, and as yet no reservoirs for the conservation of storm water have been constructed. It is estimated that the

drainage area of the Pecos River within the Territory alone is susceptible of irrigating 13,000,000 acres of excellent land, or 250 per cent more than the aggregate of farm lands now in the entire Territory. By reason of recent congressional action in providing, by means of reservoirs, for the reclamation of the public lands of the arid region, however, agriculture in New Mexico will doubtless be greatly increased in the next few years. While possessing important mineral resources, New Mexico is pre-eminently an agricultural country, 41 per cent of the 66,396 persons pursuing gainful occupations being engaged in farming and stock-raising. The following table shows the acreage, yield, and value of crops in 1899 and 1909:

	1899	1909
Number of farms in state.....	12,311	35,032
Approximate land area in state (acres).....	78,401,930	78,401,930
Improved land in farms (acres)...	327,000	1,464,000
Total acreage of farms in state...	5,131,000	11,235,000
Average acres per farm.....	417	320
Value of farm land and buildings	\$20,880,000	\$111,430,000
Value of farm land.....	17,324,000	98,496,000
Value of buildings.....	3,556,000	12,934,000
Value of implements and machinery.....	1,152,000	4,101,000
Average value per acre of land and buildings.....	4.07	9.93
Average value per acre of farm land.....	3.38	8.77
Number of farms irrigated.....	7,884	11,399
Acreage irrigated.....	803,803	459,114
Per cent of number of farms irrigated.....	64.1	38.5
Per cent of improved land in farms irrigated.....	62.4	44.0
Total cost of irrigation systems.....	\$4,140,319	\$9,019,008
Average cost of irrigation per acre.....	\$6.40	\$13.97
Expenditures for labor.....	\$1,951,000	\$3,611,000
Expenditures for fertilizers.....	\$3,000	\$24,000
Number of white farmers.....	10,893	33,180
Number of non-white farmers.....	1,418	1,852

The principal crops for 1910, with their acreage yield and value, were:

Crops	Acreage	Yield	Value
Corn.....	70,000	1,610,000 bu.	\$1,449,000
Wheat.....	43,000	860,000 bu.	860,000
Oats.....	30,000	822,000 bu.	510,000
Barley.....	1,000	25,000 bu.	20,000
Potatoes.....	2,000	94,000 bu.	98,000
Hay.....	194,000	407,000 tons	4,680,000

New Mexico is the third state in the Union in the number of sheep of shearing age, with 3,200,000 in 1910, and being exceeded only by Montana and Wyoming. It produced, that year, 19,200,000 pounds of washed and unwashed wool and 6,720,000 pounds of scoured wool.

Mineral Resources.—The mining industry is important. From 1860 to 1890 \$17,600,000 in gold was produced, in 1908 the value of the yield was: gold, \$278,300; silver, \$171,200; copper, \$875,000; lead, \$95,000. Coal mining is extensively carried on, although only the fields adjacent to the railroads have been worked. The output of coal in 1907 (mostly bituminous) was 2,302,062 tons, valued at \$3,729,340. During that year about 94,000 tons of coke were produced, valued at \$250,000. Twenty-eight coal mines were in constant operation, with 2,500 operatives and a production of 1,400,000 tons. The coal area lies chiefly in McKinley, San Juan, Colfax,

NEW MEXICO

and Rio Arriba counties, in the northern and western parts of the State. The coal-bearing formations aggregate 1,850,000 acres, of which about 40 per cent is probably productive. Iron, salt, gypsum, clay, soda, ochre, potash, mica, marble, molybdenum, tungsten, and vanadium are also found, as are turquoise, garnets, opals, and chalcedony. Mineral springs are abundant.

Political Divisions.—The following table gives the counties, with their area, property assessment, population, and county-seats:

banks with 1,864 depositors and \$1,103,695.98 savings deposits; 22 State banks with 491 depositors and \$228,047.37 savings deposits; 4 savings banks with 1,575 depositors and \$415,471.54 savings deposits. There were no private banks or loan and trust companies reporting that year. New Mexico as a territory had public debts amounting to \$4,579,516 (\$998,923 State debt and \$3,580,593 other debts).

Education.—The number of public schools in the State in 1908 was 800, with 1,065 teachers. The school population (5-21 years) was esti-

Climate.—The climate is very dry and healthful, and has made the State justly celebrated as a resort for those afflicted with pulmonary troubles. The annual mean temperature ranges from 42.4° at Winsors, San Miguel County (8,000 feet), to 65° at Carlsbad, Eddy County (3,122 feet). The highest temperature averages approximately 112° at Carlsbad (25 June), and the lowest —12° at Bluewater, Valencia County (2 Feb.). The total precipitation on the average ranges from 22.42 inches at Carlsbad, to 4.66 inches at Deming, Luna County. Nearly half the precipitation (10.5 inches) at Carlsbad occurred in July. The greatest rainfall occurs between May and August, the least between February and April. The number of rainy days on the average ranges from 78 at Santa Fé to 18 at Albuquerque; average, about 40 days. The prevailing winds are southwest, west, southeast, and east. Although the summer temperature is sometimes high, especially in the southern part, owing to the dryness of the atmosphere the heat is never oppressive and the nights are always cool.

Population.—(1870) 91,874; (1880) 119,565; (1890) 153,593; (1900) 195,310 (native, 181,685; foreign, 13,625; males, 104,228; females, 91,082; white, 180,207; colored, 15,103—of whom 13,144 are Indians). Illiterates form 33.2 per cent of the total population. Census of 1910, 327,301.

Finances.—New Mexico had a total assessed valuation in 1910 of \$62,860,852, a bonded debt of \$998,000, and a tax rate of \$11 per \$1,000. The assessed valuation is 20 per cent of the actual value. There were in 1909 37 National

mated at 68,340, the enrolment 43,647, and the average attendance 26,844. The expenditure for public schools was \$484,060, and the value of school property \$700,000, exclusive of land grants. The State maintains the University of New Mexico at Albuquerque, the College of Agriculture and Mechanic Arts at Las Cruces; a Normal University at Las Vegas, a Normal School at Silver City, a School of Mines at Socorro, and a Military Institute at Roswell. The government supports Indian training schools at Santa Fé and Albuquerque, with 300 pupils each, also two boarding schools with 174 pupils, and 19 day schools with about 600 pupils. The educational facilities of the State have greatly increased in the last 10 years. There are 11 public, society, and school libraries, having 1,000 volumes or more, aggregating 27,732 volumes, or 14 books per 100 population.

Religion.—The population consists largely of Roman Catholics, who have an archbishop, a bishop, a vicar-general, 16 regular priests, 43 secular priests, 42 churches, 325 mission churches, 6 academies for young women, a college, 8 parochial schools, 2 Indian boarding schools with 300 pupils, 2 day schools for Indians with 200 pupils, and 2 academies for boys. The Baptists have 36 churches, a college, and several mission schools; the Methodists 17 English-speaking and a number of Spanish-speaking congregations, together with a number of mission schools; the Presbyterians 45 congregations, 30 preaching stations, 25 mission schools with 45 teachers and 1,562 pupils; the Mormons 2 churches with 277 members. Other Protestant denominations have

NEW MEXICO.

CAPITOL AT SANTA FE.

NEW MEXICO

about 20 congregations, and the Hebrews 5 organizations and a synagogue.

Charitable, Penal, etc.—The Territory supports an asylum for the insane at Las Vegas, an asylum for the deaf and dumb at Santa Fé, an institute for the blind at Alamogordo, a miners' hospital at Raton, a reform school at El Rito, and an orphanage at Belen. The Territorial Penitentiary is situated at Santa Fé. A hospital and orphanage at Santa Fé and a manatorium at Albuquerque are supported by the Roman Catholic Sisters of Charity; there are also two hospitals at Silver City, one at Deming, and one at Carlsbad, all of which are supported in part by the Territory. Government sanatoria are in successful operation at Fort Bayard and Fort Stanton, where several hundred soldiers and sailors from all parts of the country have been cured of pulmonary tuberculosis. There are also several private sanatoria in the Territory.

Transportation.—The total railroad mileage of New Mexico is about 3,000, an increase of 1,000 miles in 10 years.

There are about 400 post-offices and 70 periodicals (5 daily, 60 weekly, 5 monthly).

History.—For untold generations before the discovery of America, New Mexico was the home of sedentary tribes of Indians—the ancestors of the present Pueblos—as well as of nomadic predatory tribes. The former constructed villages, principally of stone, on the mesas, in the shelves of rocky cliffs (see *CANYON DWELLERS*), and in the valleys. Their numbers considerably exceeded that of their descendants of to-day, but there is no reasonable ground for the generally popular belief that New Mexico ever contained a teeming sedentary aboriginal population, notwithstanding the hundreds of ruins scattered throughout its area, particularly west of the Rio Grande. There is definite historical as well as traditionary evidence that many of the pueblos occupied at the time of the discovery of the Southwest were later abandoned on account of Apache and Navaho raids, or by reason of epidemics, the failure of water supply, through superstition, or the efforts of early Spanish missionaries to concentrate the natives. Many ruined pueblos in the Territory may thus be accounted for; for although Coronado in 1540-2 recorded 64 inhabited villages, some of them extensive, only two (Acoma and Isleta) of the 17 which remain still occupy their 16th century sites. The recorded history of New Mexico dates from 1539, in which year Marcos de Niza, a Franciscan friar, accompanied by a Barbary negro named Estevan, or Estevanico, traversed the country from Mexico to the Zuñi Indian villages, then known as the "Seven Cities of Cibola," in the western part of the Territory. Estevan, preceding Fray Marcos during the latter days of the journey, was killed by the natives at their village of Hawikuh, one of the seven towns; Niza followed, viewed the pueblo from an adjacent height, and fled back to Mexico. In February of the following year Francisco Vasquez Coronado, guided by Niza and accompanied by a large force, marched from Compostela, Mexico, to Cibola, storming and capturing Hawikuh (which he named Granada), in July. Expeditions sent out from here by Coronado resulted in the discovery of the Hopi or Moqui villages (called Tusayan) in north-

eastern Arizona, and the Grand Cañon of the Colorado. In the autumn the army moved to the province of Tiguex, in the vicinity of the present Bernalillo, on the Rio Grande, where winter quarters were established and whence parties were sent to visit the neighboring pueblos.

In the spring of 1541 Coronado crossed the Pecos River into the present Texas and northward through the buffalo plains to the Wichita settlements of Kansas—the "Province of Quivira"—where several months were spent in exploration; but gold, which formed the object of the dreary march, was not found. The expedition returned to the Rio Grande, and thence to Mexico in the spring of 1542, having spent nearly two years in the country. Two friars remained in New Mexico and one in Kansas, but these were killed by the Indians. New Mexico was visited in 1581 by Francisco Sanchez Chamuscado, with a small escort and three Franciscans, the latter being left among the Rio Grande Pueblos. These were killed after Chamuscado's departure. Late in 1582 Antonio de Espejo, with a bodyguard, was authorized to explore the new province and to learn the fate of the missionaries. Following the route of Chamuscado up the Rio Grande, he reached Puala, or Puaray, near the present Bernalillo (the principal town of Coronado's Province of Tiguex), where the friars had been slain, the Indians fleeing on his approach. From this point Espejo extended his travels to the pueblos of Sia, Jemez, Acoma, and Zuñi, and to the Hopi towns of Arizona, thence eastward to the Rio Pecos and back to Mexico. The next important event was the colonization of New Mexico by Juan de Oñate, the first governor of the province, who reached the new country via the Rio Grande in 1598 with about 400 colonists, and established the town of San Francisco de los Españoles, later known as San Gabriel, where Chamita, at the mouth of the Rio Chama, now stands. All the sedentary tribes were visited and their vows of obedience and vassalage taken, and the country from eastern Kansas to the head of the Gulf of California explored between 1598 and 1605. In the latter year San Gabriel was abandoned and the seat of government moved to Santa Fé, which dates from this time. During the following few years the new colony barely existed; in 1617 it had only 48 soldiers and colonists, although the missionaries had been so zealous that 11 churches had been built and 14,000 natives baptized. In 1680 the Pueblos rebelled against Spanish authority, killed many missionaries and colonists, and laid siege to Santa Fé, where the panic-stricken survivors had taken refuge in the adobe Palace, which still stands. Governor Otermin finally succeeded in driving the Indians off with considerable loss, and in retreating down the Rio Grande to El Paso, Texas, with a thousand followers, leaving the natives in almost uninterrupted possession of New Mexico until 1692. In that year Diego de Vargas reconquered the province, with great loss to the Indians, enabling its resettlement toward the close of the year by 800 colonists. In 1696 the Indians again revolted, killing five friars and 21 other Spaniards, and it was not until the close of the century that the Pueblos were entirely overcome.

Henceforward New Mexico grew in im-

NEW MEXICO COLLEGE -- NEW ORLEANS

portance; new towns were established in the Rio Grande Valley, which slowly increased in population despite the constant depredations of the Apaches and Navahos. Early in the 19th century a considerable trade sprang up between the province and the settlements along the American frontier, notably Kaskaskia in Illinois, and later Franklin and Independence in Missouri, which increased from \$22,000, in 1822 to \$750,000 in 1844. This was the beginning of the overland commerce via the famous Santa Fé trail, which came to a close when the Atchison, T. & S. F. Railroad entered the Territorial capital in 1880. Mexico having thrown off the yoke of Spain in 1821, New Mexico became a Mexican province; in 1824 it was made a territory, and in 1836 a department, remaining such until 1846, when it was taken possession of by General Stephen W. Kearny in the name of the United States. In 1848, by the Treaty of Guadalupe Hidalgo (q.v.), New Mexico, the boundaries of which were very indefinite, but which comprised Arizona north of the Gila (see GADSDEN PURCHASE), and a part of Colorado, was ceded to the United States, and on 25 Nov. 1850 the Territory was organized through the agreement by Texas to the New Mexico boundary, under the Act of Congress approved 9 September. In 1863 western New Mexico became the Territory of Arizona, and in 1865 a northern strip was annexed to Colorado.

New Mexico was the scene of several conflicts during the Civil War, notably the defeat of the Federals under Canby, by the Texans under Sibley at Valverde in February 1862. Santa Fé was occupied by the Union forces in March; Sibley took possession of it a week later, but was forced to evacuate in April, after the defeat of the Confederates in Apache Cañon. Unsuccessful efforts for the admission of New Mexico as a State have been made for many years, notably in 1906 when Arizona voted adversely on the Statehood bill. On 16 June 1910 the Senate passed the bill granting statehood to New Mexico, among the last of the remaining territories. This bill specifically provides, however, that the proposed State hold no legislative sessions prior to the first of January 1912. It also stipulates that the State shall set aside 100,000 acres for a State penitentiary.

F. W. HODGE,

Smithsonian Institution, Washington, D. C.

New Mexico College of Agriculture and Mechanic Arts, opened in 1891, at Mesilla Park. It does not share in the United States land grant of 1862, but receives the annual appropriation from the Federal government provided for in the law of 1890, and also receives annually an appropriation from the Territory. The regular four years' courses are general scientific, agriculture, and mechanical engineering, on completion of which the degree of B. S. is conferred. There are in addition two years' courses in agriculture and practical mechanics, a 12 week's course in agriculture, and horticulture, a one year course in stenography and typewriting, graduate courses, and a preparatory department (five years' course). The college is coeducational, women forming about one-half the number of students; there are also women on the faculty.

New Mexico, University of, situated at Albuquerque, incorporated in 1889 by the legislature of the Territory, and intended for the State University when New Mexico is admitted to the Union. It was first opened in 1892, and new departments subsequently added till the organization now includes the collegiate department (classical and scientific courses), the departments of music and art, a business school, and normal and preparatory departments. The degrees of bachelor of arts and bachelor of pedagogy are given; also master of arts and doctor of philosophy. Women are admitted on equal terms, and a cottage for their use has been built on the campus. Connected with the university is the Hadley Climatological Laboratory devoted particularly to the investigation of the effect of the dry and plateau regions of the United States upon health and disease.

New Milford, Conn., town, county-seat of Litchfield County; on the Housatonic River, and on the Berkshire division of the New York, N. H. & H. railroad. It was settled in 1707 by John Noble from Westfield, Mass., and later a colony from (Old) Milford Conn., located at New Milford. It is situated in a hilly country which has considerable good farm land; tobacco is the great specialty. The extensive water-power of the Housatonic is being utilized by means of a canal two miles long, which extends from Bulls Bridge to New Milford. The New Milford Power Company who own the plant, will furnish electricity to towns at a considerable distance. The tobacco warehouses have over 500 employees; the wood finishing factory, 90; the hat factory, 285; upholstery works, 40; lime works, about 60. There are several other smaller manufacturing establishments. A library and Memorial Hall for the free use of the Grand Army veterans, the town hall, the churches, and schools are all fine buildings. The educational institutions are good public schools, Ingleside School for young women, and Weantstrong School for boys. The government is administered by three selectmen chosen annually by the people. Pop. (1910) 5,070.

J. A. BOLLER,

Editor 'New Milford Gazette.'

New Netherlands, *neth'ér-landz*, the name given by the Dutch to the colony they established in America in 1626. A British fleet, under command of Richard Nicolls, captured the place in 1664; and by order of Nicolls, the Duke of York was made ruler and the name changed to New York. See NEW YORK.

New Or'ange, a name applied to New York in 1673, when the colony of New Netherlands was retaken from England by the States-General of Holland. The name was used in honor of the Prince of Orange.

New Orleans, La., the twelfth city of the United States in population, and the largest south of the Potomac and Ohio rivers, is situated on the Mississippi River, 107 miles from its mouth. Built in a bend, it was originally crescent-shaped, whence its title of "the Crescent City." It has spread out in all directions, and has even taken in the suburbs on the west bank of the river, so that the resemblance to a crescent has completely disappeared.

NEW ORLEANS

Area and Drainage.—The corporate limits cover 189 square miles, including a large area of uninhabited swamp. The improved portion is 26,006 acres, or 41 square miles, in extent. The site of the city is several feet below the level of the river at extreme high water. The land is mostly flat, and slopes back from the Mississippi, draining into Lake Pontchartrain. These conditions have made the problem of draining and sewerage of the city very difficult; and it was finally solved only in 1895, when a threefold system was adopted, the sewage being emptied into the Mississippi on the south, the drainage into Lake Borgne on the east, and the ordinary rainfall into Lake Pontchartrain on the north.

In consequence of these improvements important changes have taken place in the soil and climate, which have been rendered much drier; and whereas because of the saturation of the soil it was formerly thought impossible to erect buildings more than three or four stories high, "sky-scrapers" are now built as in other American cities. As early as 1728 levees or dikes were built in front of the city to protect it against freshets. It is now surrounded by levees, and no portion of it has suffered from flood for over 50 years.

Climate.—The climate is mild and damp. A "freeze" is rare, and the thermometer has been below 17° F. only once. The mean temperature is 69° F. The summers, while long, are not excessively hot, as the nights are cool, and prostrations from sunstroke are much rarer than in other large American cities. Formerly the city suffered severely from malarial fevers, but these have disappeared with sanitary improvements, and in 1902 the death-rate among the whites had fallen to 17.2, a decrease of nearly one half, in 20 years. Among the negroes the mortality is still high.

Population.—In the years 1830-60 New Orleans increased in population from 46,310 to 168,875; the next 30 years brought the number up to 242,039; in 1900 it was 287,104; and, in 1910, 339,075. The creoles, of French and Spanish origin, and once the dominant element in politics and business, still constitute one fourth of the white population, and largely determine the social tone of the city, most of the customs and usages being borrowed from them—holidays, public celebrations and balls, the carnival, the cuisine, fashions, etc. The American influence, however, is increasing steadily.

Architectural Features.—A wide central thoroughfare, Canal Street, the shopping centre, divides the old French city, *la Vieux Carré* (the Old Square) from the newer districts. The former is built in the French and Spanish architecture of a century ago. A large part of the old city was destroyed in the fire of 1788, but many buildings still remain which date back from before the fire, and there are hundreds over a century old. The oldest public building is the Archiepiscopal Palace, dating from 1737, originally erected as a convent for the Ursuline Nuns. The Cabildo, now occupied by the State Supreme Court, was erected in 1795, and was formerly the government building. Here the cession of Louisiana from France to the United States took place in 1803. The Civil Court Building, also of Spanish architecture, was erected at the same time. The Saint Louis Cathedral, originally the Parish church of New Or-

leans, was erected in 1723. It was twice destroyed, once by a hurricane, again by fire, and was rebuilt in 1794. The Church of St. Anthony de Padua (Italian) was formerly the mortuary chapel of the old Saint Louis cemetery. In this quarter the residences are of a characteristic architecture styled "creole," largely modeled on the plantation homes of the West Indies, the dwellings being of wood or of brick and stucco. In the more densely populated section they have large courtyards in the centre; in the suburbs they are surrounded by wide verandas or "galleries," and shaded by an abundance of shrubbery.

Besides those already mentioned, the more important public buildings are the custom-house, of New England granite and solid Egyptian architecture—for many years the largest public building in this country; the Cotton Exchange, of florid Renaissance; the Saint Louis Hotel, at one time the largest in the United States, and used for some years as the Louisiana State-house; the United States Mint, Tulane University, Newcomb College, the Public Library, Howard Memorial Library, Tulane Hall, the Church of the Immaculate Conception (Jesuit), with college attached; Christ Church Cathedral, criminal courts, city-hall, and the French Opera-house, the oldest opera-house in this country.

Parks, etc.—The city is somewhat deficient in parks. The City Park is geographically central, in what was formerly used as a dueling ground. Audubon Park, fronting on the Mississippi, was the de Boré plantation, on which sugar was first produced in Louisiana. Both are well shaded by immense live oaks over a century old. Audubon Park has a handsome horticultural hall, erected in 1884, containing a fine collection of tropical trees and plants, and here is also a model sugar and cotton farm—the Audubon Experiment Station. Jackson Square, formerly the Place d'Armes, on which the Saint Louis Cathedral, Cabildo, and court buildings face, was laid off at the foundation of the city, and was the centre of New Orleans history for a century and a half. It contains an equestrian statue of Gen. Andrew Jackson. Beauregard Square was formerly Congo Square, the gathering place of slaves in the earlier days. Lafayette Square, on which the city-hall faces, contains statues of Henry Clay and John McDonogh, who left his large fortune to educational purposes. Lee Circle contains a tall pillar surmounted by a statue of Gen. Robert E. Lee. Margaret Place contains a statue of Margaret Haughery, "the friend of the orphans." Jackson Barracks, the United States army station, has extensive grounds. On the west side of the river is the United States Naval Reservation, with a large floating dock for the use of men-of-war and a naval station in the course of construction.

Municipal Divisions and Government.—New Orleans is divided into seven municipal districts, corresponding with the towns or "faubourgs" that have at different times been annexed to the original city, and 17 wards. Its assessed valuation is \$156,500,000. The government is administered by a mayor and council, but most of the municipal functions are under the control of appointive boards or commissions.

Banishing.—New Orleans is the most impor-

NEW ORLEANS

tant banking centre of the Southwest. It has eight national, seven state, and five savings banks, with a capital of \$15,890,150, deposits of \$58,579,600, and resources of \$77,356,346.

Commerce.—New Orleans is the second port of the United States, being exceeded in commerce only by New York. Its commerce, foreign and coastwise, amounts to \$720,000,000 a year. The Mississippi River, which is the chief channel of trade, is from 1,800 to 3,600 feet wide and from 60 to 240 feet deep. Including the commercial suburbs of Port Chalmette, Gretna, and Westwego, New Orleans has a frontage on the river of 26 miles, lined throughout the greater part with wharves and docks. The present channel through the Eads jetties in South Pass permits vessels drawing 30 feet of water to ascend from the Gulf of Mexico to New Orleans. Work was begun in 1903, to be completed in 1908, on a new outlet through Southwest Pass, which will admit vessels drawing 35 feet of water.

New Orleans is the largest cotton port in America and has the largest export of cottonseed-oil and by-products. It is first in the importation of tropical fruits, and second in coffee. Its export is also large in hides, wool, lumber, staves, rice, flour, tobacco, and all the products of the South and West.

The railroads centring at New Orleans are the Southern Pacific, Texas & Pacific, Louisville & Nashville, Southern, Illinois Central, Yazoo & Mississippi Valley, New Orleans & Northeastern, St. Louis & San Francisco, Shreveport & Red River Valley with two local lines, the New Orleans & Southern, and the New Orleans, Fort Jackson & Grande Isle, all together operating or controlling 49,363 miles of road.

All the lines have extensive yards and terminal facilities, the most important being those of the Illinois Central at Stuyvesant Docks, with a mile front on the Mississippi, and those of the Southern and the St. Louis & San Francisco at Port Chalmette, with three miles of front on the river and improvements to cost \$15,000,000.

The Mississippi River, besides offering wharfage for ocean vessels, is the source of a large steamboat and barge traffic, extending to all parts of the Mississippi Valley. The Carondelet and New canals give access to Lake Pontchartrain and Mississippi Sound, and handle a large trade in coal, iron, lumber, building materials, and naval stores. There are from 5,000 to 6,000 arrivals per year by canal, generally of small vessels.

Manufactures.—The manufacturing interests have greatly developed since 1885. New Orleans has now the largest manufacture of cottonseed-oil and by-products; the largest milling of rice; and is one of the chief centres of sugar-refining, and of the manufacture of lumber, clothing, bags, cigars, and cotton goods. The census of 1909 returned 848 manufacturing establishments, having \$56,934,000 capital, and products valued at \$78,794,000. This output shows an increase of over \$90,000,000 since 1903.

Educational and Charitable Institutions.—The educational facilities of the city have been greatly improved and extended in recent years. Tulane University has four departments, law, medicine, the arts, and sciences, and Newcomb College for the higher education of women, all well endowed. It has 67 teachers and 1,350

students. The College of the Immaculate Conception has an average annual attendance of 400 students. There are also a college of pharmacy and a college of dentistry, besides numerous minor educational institutions. There are four colleges for negroes: Southern University (supported by the State), New Orleans University (Methodist), Leland University (Baptist), and Straight University (Congregational), with 60 teachers and 3,400 students, mainly in the preparatory grades. The public school system includes three high schools and 69 grammar and preparatory schools, with an average attendance of 32,000 children. The private and parochial (mainly Catholic) schools have an average attendance of 12,000 pupils. The Ursuline Convent, for the higher education of girls, is the oldest school of its kind in the United States, having been in uninterrupted session since 1729. Newcomb College, established in 1887, has done much for the development of education and art among the women of Louisiana. The three libraries—the Fisk and Public Libraries, the Howard Memorial, and the State Library—have a total of 180,000 volumes.

Most important among the charitable institutions is the Charity Hospital, founded in 1782. It is supported by the State, has 850 beds, accommodates an average of 8,500 patients, while 20,000 to 25,000 more are given outside treatment each year. Connected with it is the Richard Milliken Hospital for children. The Eye, Ear, Nose and Throat Hospital is also a charity institution. Other hospitals are the United States Marine Hospital, the Touro Infirmary, Hotel Dieu, New Orleans Sanitarium, and the Louisiana Retreat, the last for the insane. There are 47 asylums with 3,500 inmates, receiving small appropriations from the city, but maintained mainly by charity or endowment funds.

Churches.—There are 294 churches, of which 203 are for whites and 91 for negroes. The Catholics, with 41 churches, are strongest in point of numbers. The Baptists have 66 churches, of which 61 are for negroes; the Methodists 39, of which 21 are for negroes; the Episcopalians 14, Presbyterians and Lutherans 13 each. There are also 6 Jewish synagogues.

Cemeteries.—The cemeteries number 33, some of them being in the central portion of the city. The dead are usually buried above ground in vaults on account of the humidity of the soil. The National Cemetery at Chalmette contains the bodies of many Union soldiers.

History.—The site of New Orleans, on which stood a village of the Houma Indians, was first visited in 1699 by a French expedition under Bienville, who in 1718 obtained the consent of the French government to the establishment of a colony there, and the city was laid out and named in honor of the French regent, the Duc d'Orléans. In 1726 it was made the capital of the French colony of Louisiana, which then included nearly all the Mississippi Valley. The first colonists, either Frenchmen or French Canadians, were reinforced by settlers from the West Indies and Germans sent over by John Law (q.v.). The province having been transferred to Spain in 1763, a Spanish force was sent to take possession of New Orleans, but was driven out by the inhabitants, who established a government of their own, to which the Spaniards put an end in 1769. The population, at that time,

NEW ORLEANS.

JACKSON SQUARE AND CATHEDRAL.

;

1790, was greatly increased during the period of Spanish domination by accessions from Spain, the Canary Islands, and Santo Domingo, and of French Acadians from Nova Scotia. The original population was never friendly to Spain. By Spanish governors New Orleans was walled and surrounded with fortifications. At the time of the Louisiana Purchase (q.v.), in 1803, its inhabitants numbered 11,856; its commerce was large, and its society, which included many families of wealth and culture, was noted for fashion and refinement.

New Orleans was incorporated as a city in 1804. When, in 1812, Louisiana (q.v.) was admitted to the Union as a State, the city was its capital, as it had been that of the province, remaining such until 1852. From 1865-80 it was again the State capital.

On 8 Jan. 1815 occurred the battle in which Gen. Andrew Jackson defeated the British army under Gen. Pakenham. It was fought at Chalmette, now a suburb of the city.

The racial jealousies existing between the creoles and the new comers or Americans led to division of New Orleans in 1836 into three municipalities, each with a government of its own. They were consolidated again in 1852, at which time New Orleans was the third city in population in the Union, and was disputing with New York the first place in commerce.

Soon after the secession of Louisiana from the Union and the establishment of the Confederate government, New Orleans was blockaded by the Federal fleet under Farragut. It was captured in April 1862. A succession of misfortunes followed the Civil War—epidemics, political troubles, and the inundation of the surrounding country. The city for a time increased slowly in population and actually declined in commerce and business. Improvement began in 1879, with the Eads jetties, which enabled vessels of larger draft to enter the Mississippi. A more marked gain came in 1896 in the way of improved sewerage and drainage, for which the people voted a special tax of \$16,000,000. Better sanitary conditions were secured, and then followed the increase and extension of railroad facilities, the opening up of new territory to trade, and the development of manufacturing industries, all leading to the present rapid growth and sustained prosperity of the city.

NORMAN WALKER,

Associate Editor 'Times-Democrat.'

New Orleans, Battle of, The, in American history, an engagement fought on 8 Jan. 1815, between a force of 12,000 British under Sir Edward Pakenham, and one of 6,000 Americans under Gen. Andrew Jackson. The latter were in a strongly entrenched position and awaited Pakenham's assault on their lines. The battle lasted only 25 minutes, when the British fled, leaving behind them 2,600 killed and wounded. Pakenham was among the slain. The Americans' loss was only 8 killed and 13 wounded. In this battle the weight and precision of the American fire were such that no troops in the world could have stood against it. One British authority says that not even from Saint Sebastian had so severe a fire been poured upon an attacking force. One British regiment, the 93d Highlanders, distinguished for its services in many parts of the world, lost more than half

its men, having been brought to a point where it could do no good, but where it could be most effectually operated upon by the Americans. The British troops never behaved better, but they were badly handled.

New Orleans, Capture of, in 1862. The Civil War engagement which resulted (24 April) in the taking of New Orleans, was actually fought 70 miles down the Mississippi. The great bend next below the city was commanded by Fort Jackson on the west (north) bank, and Fort Saint Philip on the east. Supposed to mount 150 guns each, they had in fact 109 together, over half of them only 24's; and the garrison was largely Northerners and foreigners. The river was blocked by a chain buoyed by 11 steamer-hulks, and there were fire-raft and boats above. Farragut's fleet comprised 17 wooden vessels with 154 guns; besides six gunboats with 30 guns and 20 mortar-schooners with one gun each, under command of David D. Porter (q.v.). Bombardment on the forts was opened 18 April; and on the night of the 20th a Union vessel hugging the bank got above the boom, and coming down with a full head and current, snapped the chain and left the channel free. After three days' more bombardment it was determined to pass the forts instead, in the dark, and on the morning of the 24th, about 2:30, the vessels steamed forward in two columns, Farragut leading one in the Hartford, Capt. Theodorus Bailey the other, while the mortar-boats shelled the water-battery commanding the approach to Fort Jackson. All but the last three of Farragut's columns succeeded in passing the boats before daylight made it impossible, the vessels' guns in turn driving the fort gunners from their posts. Above, the Confederate flotilla of 17 vessels inflicted great damage, one Union gunboat being sunk, one badly crushed by a ram and the Hartford fired by a fire-boat. Nine Confederate vessels were sunk or captured, however, and the Union fleet proceeded to New Orleans and compelled it to surrender. On the 28th the forts also capitulated. It is due to history to add that of the 17 Confederate vessels, 9 of which were rams and 2 ironclads, only 4 vessels and 12 guns were in such condition as to be capable of making a fight. If the materials of the force of John K. Mitchell, the Confederate commander, had been completed, his little fleet could have made a very creditable defense; but J. R. Soley, of the United States navy, truly says that no commander, taking hold of his vessels in their incomplete condition four days before the fight, could have made much out of them. This victory of Farragut's prevented Louis Napoleon from recognizing the Confederacy and raising the blockade, and hence was one of the most important of the war.

JOSEPH T. DERRY,

Author of 'History of Georgia.'

New Orleans University, in New Orleans, La.; coeducational, founded in 1873 under the auspices of the Methodist Episcopal Church. It has preparatory and collegiate departments, and its courses lead to the degrees of A.B., B.S., and Ph.D. In 1910 there were connected with the school 52 professors and instructors and nearly 930 students. The library contained over 6,000 volumes, the grounds and buildings were

NEW PHILADELPHIA—NEW SOUTH WALES

valued at \$130,000, the productive fund was about \$12,000, and the income about \$8,000.

New Philadelphia, Ohio, city, county-seat of Tuscarawas County; on the Tuscarawas River and the Ohio Canal, and on the Pennsylvania and the Cleveland, L. & W. R.R.'s; about 100 miles northeast of Columbus and 90 miles south of Cleveland. It was settled in 1805 and incorporated in 1808. It is in an agricultural region, but its good water-power and facilities for transportation have contributed toward making it a manufacturing city. Some of the manufactures are pressed, stamped, and enameled goods, steel products, flour, woolen goods, brooms, canned goods, tile, and wagons and carriages. Shorenbraun Springs and Springer's Park are of interest. The mayor is elected biennially, and the council appoint or elect the administrative officials. Pop. (1910) 8,542.

New Philippines, fil'p-pinz or -pēnz, a name sometimes given to the Caroline Islands (q.v.).

New Pla'tonists. See NEO-PLATONISM.

New Pomerania, or Neu Pommern, noi pōm'ern, formerly NEW BRITAIN, the largest island of the Bismarck Archipelago (q.v.), 50 miles distant from Kaiser Wilhelm's Land, New Guinea, Rock Island and the Dampier, and the Vitiaz straits, intervening. It is crescent shaped, 300 miles long, with a maximum breadth of 90 miles, and an estimated area of 9,500 square miles. There is a German mission and trading station on the northeast coast. The inhabitants are savage Papuans.

New Providence, one of the Bahama Islands (q.v.), northeast of Andros Islands and about 300 miles east by north of Key West. In 1629 the first English settlement on the Bahamas was made on New Providence. This island has the best harbor of any of the group. Nassau (q.v.), the capital of the islands, is on New Providence. Although this island, as all of the group, belongs to Great Britain, it is a part of Roman Catholic archdiocese of New York.

New Red Sandstone, in geology, a term formerly used, in contra-distinction to Old Red Sandstone (q.v.), of red shale, loam and sandstone lying above the coal measures. The nomenclature is faulty, being based only on a color distinction, and it is now recognized that the rocks formerly grouped under this name are at two very different eras, the Permian and Triassic (qq.v.).

New River. See GREAT KANAWHA.

New Rochelle, rō-shēl', N. Y., city, in Westchester County; on Long Island Sound, and on the New York, N. H. & H. railroad; 16¼ miles from the Grand Central Station in New York city. It has connection by electric railroads and trolleys with New York city and several of the villages and cities in the vicinity. It was settled in 1687 by Huguenots, and was named after La Rochelle, France. It has a beautiful location, and is considered a desirable residential city by a large number of the business men of New York. It has a well-kept park, and Glen Island, Echo and Neptune bays are nearby. The prominent buildings are a number of old colonial edifices, several of the churches, especially Saint Gabriel's (R.C.), with

its parish school building, both gifts of Adrian Iselin, the Masonic Temple, a hospital, Knights of Columbus and the city buildings. The water supply is exceptionally pure; and the vital statistics show a low death rate. It is the seat of the Ursuline Seminary of Saint Teresa, founded in 1898, and it has several private schools, good public and parish schools, and a public library which contains about 9,000 volumes. Thomas Paine resided here for some years. At present (1904) it is the home of a number of well known authors and artists. Pop. (1890) 9,057; (1900) 14,720; (1910) 28,867.

New Siberia, or Liakhof (lā-ān'ōf), Islands, a group of islands in the Arctic Ocean, off the north coast of Siberia, between the mouths of the Lena and Indigirka, and administratively attached to the government of Yakutsk. The group comprises Liakhof, Maloi, New Siberia, Thaddeus, Kotelnoi, and Bennett Islands; the area is estimated at 20,480 square miles; they are rocky, treeless, icebound all the year round, and uninhabited. Reindeer, foxes, and white bears are found, and there is immense wealth in fossil ivory, the remains of mammoth, rhinoceros, and buffalo.

New Somersetshire, in American history, a name given the territory extended to William Gorges in 1636, and comprising those settlements along the coast of Maine, which had not been included in the Ferdinando Gorges patent of 1631. William Gorges was appointed first deputy-governor of the district.

New South Shetland Islands. See SOUTH SHETLAND ISLANDS.

New South Wales, Australia, the oldest Australasian colony of Great Britain and since 1901 one of the six original and the most populous, though not the largest, state of the commonwealth, in the southeastern portion of the continent. It is separated from Queensland on the north by an irregular line running southwest from Port Danger in lat. 28° 8' S., till it meets the 29th parallel of latitude which forms the rest of the north boundary; on the east the Pacific Ocean is the boundary; on the south the Murray River, and a line running northwest from Cape Howe, lat. 37° 31' S., separates it from Victoria; while on the west the 141st meridian forms the boundary between the state and South Australia.

The state has an area of 310,700 square miles divided into 141 counties. It is more than twice the size of the State of California and five times the size of England and Wales.

Topography—The surface, more especially in the eastern and most populous portion, is much diversified, and presents, in its general features, a succession of hills and valleys, mountains and plains. The great dividing chain forming the great watershed of the state, with many summits

NEW SOUTH WALES

varying in height from 3,000 to 6,000 feet, extends from north to south nearly parallel to the coast, at the distance commonly of from 30 to 50 miles inland or sometimes more, and takes in the north the name of Liverpool Range, in the centre that of the Blue Mountains, and in the south that of the Australian Alps. The highest summit is Mount Kosciusko, in the southeast 7,328 feet. The space between the mountains and the sea is partly broken by spurs and ramifications, but descends from the west with more or less rapidity, and has a generally undulating surface, intersected by water-courses; in some places well wooded, and in others covered with dense brush-wood. The coast line presents in general bold perpendicular cliffs of sandstone, in horizontal strata. Occasionally the cliffs are interrupted by low sandy beaches, some of which stretch to a considerable distance inland, and appear to have been covered by the sea at no very remote period. The indentations of the coast are remarkable for their number, and the excellent harbors which they form. Among them are Port Stephens, Port Hunter, Broken Bay, Port Jackson (on which lies Sydney), Botany Bay, Jervis Bay, Sussex Haven, and Two-fold Bay.

Hydrography.—The most important rivers are the Murray, which is navigable as far as Albury (lon. 147° E.); the Murrumbidgee and Lachlan, farther north, which after uniting fall into the Murray; and the Darling, which flows from northeast to southwest through the whole extent of the state, and also falls into the Murray. The Darling, in its upper course known as the Barwon, has among its more considerable affluents the Bogan, the Macquarie, the Castlereagh, the Namoi, the Gwydir, the Macintyre, and the Warrego. The Murrumbidgee is 1,350 miles long, the Darling 1,160, the Macquarie 750, the Lachlan 700. Notwithstanding the existence of those large rivers the western plains are but sparsely watered. The comparatively narrow space between the mountains and the Pacific leaves little room for the development of large rivers. Many of them are for a great part of the year either altogether dry, or form a succession of deep ponds or water-holes instead of continuous streams. The chief are the Hunter, 300 miles, which falls into the fine port of that name at Newcastle, and is navigable for 50 miles above its mouth by small craft of 30 to 40 tons; and the Hawkesbury, 130 miles, which falls into Broken Bay, and is navigable by vessels of 100 tons as far as Windsor, a distance of 140 miles. Others are the Shoal-haven, 260 miles; the Clarence, 240 miles, of which 70 are navigable; the Macleay, 190 miles; and the Richmond, 120. Some of these rivers in the winter season cause disastrous floods.

Geology and Mineral Resources.—In the southeast, east, and middle the prevailing rocks are Palæozoic (Silurian and other), with granite and other igneous rocks forcing their way to the surface, and in this region are chiefly situated the metalliferous deposits in which New South Wales is so rich. In the east Carboniferous and Permo-Carboniferous rocks also occur extensively, and to these belong the large and valuable coal fields of the country. Valuable sandstones also exist here in abundance. Cre-taceous rocks extend over a wide area in the north and west, and the plains are mostly of Pleistocene origin. In connection with the

granite, limestone, both granular and foliated, occurs in abundance, and besides being often hollowed out into stalactitic caverns, sometimes passes into a beautiful close-grained marble, as white as that of Carrara.

The coal fields extend over an area of 10,000 acres, with more than 91 mines. The state exports considerable quantities of coal to the west coast of North and South America. Copper ore of the richest quality and tin exist in large quantities, and iron is very generally distributed. Gold is found in all parts of the state; the value of the output in 1901 was \$4,606,410, showing a considerable diminution; the total value of the output of gold for fifty years since its discovery in 1851, is \$248,309,075. Most of the gold is sent to the mint for coinage. The combined value of the silver and lead output in the same year was over \$6,500,000. Several varieties of precious stones have been found, notably opals.

Climate.—As the area of the state extends over 110 degrees of latitude and contains a good deal of elevated ground, nearly every variety of climate is to be found. In the north the climate is tropical, while on the table-lands severe frost is not uncommon. The interior plains are very dry, and severe droughts occasionally kill millions of sheep, but the coast districts have abundant rains. Though the hot winds of the warm season are annoying, they are not unhealthful, while storms and electrical disturbances are comparatively rare.

Forestry, etc.—About one fourth of the area of the state consists of forest lands, which in 1887 were taken under the care of the government by the creation of a Forest Conservation Department. For the Flora and the Fauna of the state, see AUSTRALIA.

Agriculture and Stockraising.—The absence of water renders much of the land useless for agricultural purposes, but a large proportion is devoted to pasturage and grazing. In some places artesian wells have been introduced with good results. There is no great breadth of highly fertile land away from the river banks; but the fertility of the land on the margins of rivers is exceptional. Where liable to inundation, however, the year's harvest may be swept away in a few hours. The area under cultivation in 1902 was 2,274,403 acres, and the crops included wheat, maize, barley, oats, rye, millet, potatoes, lucerne and artificial grasses, vines, orange-trees, sugarcane, some tobacco, etc. Dairy husbandry is becoming important, and butter is exported. Native fruits are neither numerous nor valuable, but the best of those of Europe are acclimatized. So well does the peach thrive, for instance, that farmers sometimes feed their pigs with the windfalls of their orchards. Other fruits include oranges, apples, pears, apricots, nectarines, cherries, plums, figs, grapes, melons, mulberries, gooseberries, currants, etc., and in the more-northern parts the banana is abundant. The rearing of silkworms on the mulberry, which might be carried to an almost indefinite extent, has attracted attention. The grapevine is successfully cultivated, as well as the sugarcane; considerable quantities of wine, brandy, and sugar being made. The rearing of sheep (of which there are about 50,000,000 in the state) and cattle are the chief employments of the people.

Commerce and Industries.—Wool is the most

NEW SWEDEN—NEW TESTAMENT CHRONOLOGY

important article of export. The annual value of this export is not without fluctuation, but is again increasing. In 1908 the quantity of wool exported was 338,129,000 pounds, valued at \$65,000,000. Other important exports comprise coal, silver ore, silver lead, gold, and coin, frozen and preserved meat, butter, tallow, leather, wheat, and flour. The principal imports are wearing apparel, sugar, tea, and hardware. The value of the total exports in 1908 was \$204,928,795, of imports \$188,213,730. In 1908 the number of vessels entered and cleared was 6,415, with a tonnage of 12,601,909.

The manufacturing industries are naturally not of much importance as yet, but they are already very varied, and help to supply a considerable share of the home demand. In 1909 there were 3,623 miles of railway open, nearly all constructed by government, which has spent over \$200,000,000 upon the railways; 15,910 miles of telegraph line were in operation.

Government.—The constitution of New Wales vests the legislative power in a parliament of two houses, namely the Legislative Council and the Legislative Assembly. The former consists of 21 members nominated by the crown, originally for the term of five years, but, subject to certain conditions, for life at the expiration of that period; and the latter of 125 members chosen by the same number of constituencies. Members of the Assembly receive £300 per annum, and they are entitled to travel free by rail or tram in the state. As electors require no property qualification there is virtually universal suffrage. The executive consists of a governor nominated by the crown, assisted by a council composed of state secretary, state treasurer, the ministers for lands, public works, mines and agriculture, education, and justice, the postmaster-general, and the attorney-general. The parliaments last for three years. Unless local acts supersede them the imperial laws are enforced. No enactment of the state legislature becomes law till sanctioned by the governor, and in some cases by the sovereign. The state sends 6 representatives to the federal senate, and 26 to the federal house of representatives. The state has taken measures for its own defense, and has a force, partly paid, partly volunteer, numbering more than 6,000, and including infantry, cavalry, artillery, engineers, naval brigade, etc.

Population.—On 31 March 1908 the population was 1,580,968, of whom 844,540 were males and 736,419 females, chiefly British-born subjects. The aborigines numbered about 5,000 and the Chinese 11,000. Sydney is the capital, and other urban centres are Broken Hill, Newcastle, Parramatta, Goulburn, Maitland and Bathurst. Pop. (1910 est.) 1,700,000.

Religion and Education.—There is no established religion. Among the religious sects the Church of England, Roman Catholics, Wesleyan and other Methodists, and Presbyterians hold the chief place. Education has been since 1880 controlled by a minister of public instruction. The public schools are classified as public primary schools, superior public schools in the chief centres of population, evening schools, high schools for boys, and high schools for girls. Primary education is compulsory, but not free, unless in cases where parents are unable to pay fees. Among the higher educational institutions are the Sydney Grammar

School, and St. Paul's, St. John's and St. Andrew's colleges, and the Women's College, the colleges being all connected with the University of Sydney—an important institution, attended by between 600 and 700 students, and granting degrees in arts, medicine, science, and law. Technical education is administered by a special branch of the department of public instruction.

History.—New South Wales was discovered by Captain Cook in 1770, and founded as a penal settlement (at Botany Bay) in 1788, the convicts being employed in road-making and preparing the soil for agriculture. One of its early governors was the notorious Captain Bligh, who was deposed by the colonists in 1808. The most important events in its history since convict immigration ceased in 1840 are the establishment of representative institutions in 1843, the erection of Victoria into a separate colony in 1850; the discovery in May 1851 of extensive gold tracts; the rush to the diggings, with consequent great increase in population and prosperity; and the incorporation of the colony in the Australian commonwealth in 1901. The first railway, from Sydney to Parramatta, was opened in 1855. Among more recent events are the Sydney Exhibition held in 1879, and the Intercolonial Conference held at Sydney in 1883. The colony celebrated its centenary in January 1888, and a special series of stamps of elaborate design was issued in commemoration of the event. On 1 Jan. 1901 Sydney was the scene of the inauguration of the first governor-general of the new commonwealth, Lord Hopetoun. (See AUSTRALIA; AUSTRALIAN FEDERATION.) CHARLES LEONARD-STUART, B.A.,

Editorial Staff, 'Encyclopedia Americana.'

New Sweden, or New Swedeland, a name given in the 17th century to land lying between the Dutch colony of New Netherlands and the English colony of Virginia. It included territory in what is now Delaware and New Jersey. It was settled in 1638 by a colony from Sweden; and in 1655 it was taken possession of by the Dutch.

New Testament. See BIBLE.

New Testament Chronology, the chronology of the events related in the four Gospels, and the Acts of the Apostles, together with the dates of the Apostolic epistles. It may be outlined as follows:

The Birth of Jesus Christ.—According to the First Gospel Christ was born in the days of Herod the Great, whose death, as shown by concurrent testimony, took place 750 A.V.C. Josephus (Ant. XVII. viii. 1) tells us that this event occurred 37 years after he had been raised to the throne by the Romans 714 A.V.C. This would be 40 years before the Christian era as calculated by Dionysius Exiguus (533), who placed the birth of Christ in the year 754 A.V.C. Herod, therefore, died 750 A.V.C. Josephus says this event took place a little before the Passover, that is, in the spring of 750. The Nativity must be placed before this, and far enough before it to admit of time sufficient being allowed for the presentation in the temple, the visit of the Magi,

NEW TESTAMENT CHRONOLOGY

and the flight into and sojourn in Egypt, during which last period the death of Herod took place. It cannot then be placed later than the autumn of 740 A.U.C. (5-4 B.C.). The day and the month on which the whole Christian Church celebrates the event was fixed in the time of Chrysostom (about 386 A.D.) and has been retained ever since among both Eastern and Western Christians. There is no historic or scientific basis for the assignment. Some have held that as 25 December follows the winter solstice and is a period of the year at which the sun is rising day by day higher in the heavens with the new promise of spring, it was chosen arbitrarily, but fancifully, as a suitable time for celebrating the dawn of an era which brought fresh life to the human race. Others, with more reason, aver that as the Saturnalia extended an old Roman times from 17 December to 23 December, so the Christian festival was chosen at a date at which it may be thought suggestively to replace a pagan holiday during which slaves were for a few days free, sat at their masters' tables, and were served by them. Perhaps the Latin festival of the *Brumalia*, the feast "Invicti Solis" (of the "Invincible Sun") was intended to be superseded by the Christian festival of the "Sun of Righteousness." It may be observed in passing that as the supposed day of the Nativity would have occurred during the rainy season in Palestine it is extremely unlikely that shepherds would then have been watching their flocks by night in the open air.

Synchronistic Roman History.—(1) Saint Luke says that the census which took Joseph and Mary to Bethlehem took place while Quirinus (Cyrenius) was legate of Syria (Luke ii. 2). This legate, history tells us, was appointed to carry out the census 10 years later, 6 A.D. This had been made much of by Strauss and others, but Dr A. W. Zumpt (see ZUMPT, AUGUST W.), the famous German philologist, in his tractate, "Das Geburtsjahr Christi" (1869), has shown that Quirinus was twice governor of Syria, for the second time 753 A.U.C. (2) Another difficulty has been found in Saint Luke's date of Saint John Baptist's mission, which he says (Luke iii. 1) began in the 15th year of the reign of Tiberius. Tiberius did not become sole emperor until 14 A.D., but he began his reign as associate emperor with Augustus 12 A.D. (765 A.U.C.) which gives 780 A.U.C. or 27 A.D. for the date of the Baptist's ministry, when he would be in his 30th year, as was Jesus Christ (Luke iii. 23) and not 28 as if calculating from the sole reign of Tiberius. (3) The restoration of the temple by Herod the Great began 18 B.C. (John ii. 20). Forty-six years after that would be 27 or 28 A.D., which would be the commencement of our Lord's ministry in Galilee. The completion of the temple to its full magnificence was not accomplished until the day of Herod Agrippa II., 64 A.D. (Compare Josephus, 'Antiquities of the Jews,' XV. xi. 1). (4) The death of Herod I. (Acts xii. 23) occurred 44 A.D. (5) According to Tacitus, 'Annales,' xii. 52, and Suetonius, 'Claudius,' the Jews were expelled from Rome (Acts xviii. 2) by the emperor Claudius 52 A.D. (6) Festus (Porcius Festus), Acts xxv. 1, was appointed procurator of Judea 60 A.D. (7) The persecution of Nero in which Saint Paul was put to death began 64 A.D. in the 10th year of that em-

peror's reign, while Gessius Florus was procurator of Judea.

From the Birth of Christ to the Fall of Jerusalem.—At the time of Christ's birth C. Sentius Saturninus had been succeeded as legate of Syria by P. Quintilius Varus with whom, according to Dr A. W. Zumpt, P. Sulpicius Quirinus was associated (Luke ii. 2). Judea was made an imperial province under Augustus himself, who governed it by procurators, or stewards, on the deposition of Archelaus, 6 A.D. Herod Antipas continued to reign as vassal king of Galilee and Perea, while Cyrenius (Publius Sulpicius Quirinus) carried out the census; enrolment of the population, or "taxing" (Luke ii. 2). Coponius appears to have been the first procurator and was followed, 9 A.D., by Marcus Ambivius. The appointment of Tiberius as colleague to Augustus at Rome in 12 A.D., corroborates the computation of years in Luke iii. 1. Annas Rufus was procurator in 13 A.D. and Valerius Gratus in 14 A.D. Tiberius was made sole emperor in the same year. Caiaphas was made high priest in 25 A.D., and Pontius Pilate appointed by Tiberius his procurator in Judea 26 A.D. The last Passover of Christ, his Crucifixion, Resurrection and Ascension occurred in the early spring of 30 A.D., and the day of Pentecost on 26 May of the same year. The martyrdom of Stephen and the conversion of Saint Paul happened two or three years later, and Paul's first visit to Jerusalem took place 35 A.D. Caligula was emperor in succession to Tiberius in 37. He in turn was succeeded by Claudius in 41 A.D., the same year that Herod Agrippa was made king of Judea and Samaria. Saul was introduced to the Christians at Antioch in 43 A.D. and Herod died in 44; in that year Cuspius Fadus was appointed by the emperor Claudius to be his procurator in Judea. It was 45-46 A.D. that the famine raged at Jerusalem and Paul and Barnabas visited the brethren there with relief. Tiberius Alexander was procurator when the famine reached its height in 46 A.D. In 47 A.D. Paul and Barnabas made their first missionary journey together, and returned in the autumn of 49 to go to Antioch. The Council of Jerusalem took place the same year. In 50 A.D. Paul set out with Silas on his second missionary journey, in which year Claudius uttered his decree of banishment against all the Jews, sorcerers and magicians in Rome. In 51-52 A.D. Saint Paul visited Athens and Corinth, and from the latter city wrote his first and second epistles to the Thessalonians. He left Corinth early in 53 A.D. and arrived at Jerusalem in March, whence he proceeded to Antioch and wrote his epistle to the Galatians. Thence in the same year he started on his third missionary journey which ended at Ephesus, where he spent three years, 53-56 A.D. Nero succeeded to the purple in 54; the first epistle to the Corinthians was despatched 55, and in 56 Saint Paul left Ephesus and visited Macedonia and Corinth. From Macedonia he wrote his second epistle to the Corinthians, 56 A.D., and from Corinth his epistle to the Romans 57 A.D., after which he left Corinth for Jerusalem, where he was arrested in the temple and brought before the procurator Porcius Festus. He was taken to Caesarea 57-59, appealed to Caesar, as a Roman citizen, and was sent to Rome, 59 A.D. He was shipwrecked at Malta,

but reached Rome in March 60. While in prison (61-62 A.D.) he wrote his epistles to the Colossians, the Ephesians, the Philippians and Philemon. He was tried and acquitted early in the year 62 A.D., and made a missionary journey in Macedonia, Asia Minor, Crete, and most probably Spain (63-66 A.D.). In the meantime he wrote his first epistle to Timothy and his epistle to Titus. He wintered at Nicopolis and in the spring of 66 A.D. was sent to Rome and underwent a second trial 67 A.D., wrote a second epistle to Timothy and was put to death by the sword in the last year of Nero's reign, in the 68th year of his age, and the 35th of his conversion. The first persecution of the Christians took place under Nero, who was succeeded by Galba 68 A.D. Under Vespasian, who took the purple 68 A.D., the Romans made war on the Jews under the leadership of Titus, son of and eventually successor to Vespasian, and the destruction of Jerusalem took place 70 A.D. Consult: Lewin, 'Fasti Sacri' (1865); Ramsay, 'Saint Paul the Traveler and Roman Citizen' (1896); Ideler, 'Handbuch der Mathematischen und Technischen Chronologie' (1825); Wieseler, 'Chronologische Synopse der vier Evangelien' (1843; English translation, London 1878); 'Chronologie des apostolischen Zeitalters' (1848).

New Testament Criticism, Status and Drift of. If the importance of a writing be estimated by the influence it exerts and has exerted on the mind of men and on the history of the human (more particularly the Caucasian) race, *Homo Europæus*, and there seems to be no other standard nearly so just, then it must be admitted that the New Testament writings so far transcend all others as to form a class of their own. This affirmation need not be argued; it is undisputed. Hence it becomes a matter of supreme interest to understand these writings, from which modern no less than mediæval history takes its start, its form, its color, and, in great measure, its inspiration. But no understanding is final or satisfactory that is not historical. The question of Zoology is not, "What use have cattle for their horns?" but rather, "How did cattle get their horns?" So, too, the primary query with the critic is not, "What does the New Testament teach?" (this question is left to the divine and the theologian), but How did these Scriptures come into being? Who wrote them? When? Where? Under what circumstances? And for what ends? The whole body of knowledge thus far attained, and, still more, the whole body of investigation touching these inquiries are comprehended under the title of New Testament Criticism. This latter has therefore, in first line, nothing to do with questions as to the truth or falsity of any teaching of the Scriptures, nor with any matters of doctrinal or dogmatic interpretation, except in so far as these latter may be bound up with the conclusions concerning the genesis of the Scriptures themselves. This criticism, then, is essentially a discussion of origins, and not of values. However, it need not be disguised that doctrinal values, or at least estimates, may often be seriously affected by our determination of origins. In case of some scientific verity or method, as of the Pythagorean theorem or the use of zero in numerical notation, it may be quite indiffer-

ent whether the source be found in Greece or in Egypt, in Babylon or in Japan; but in case of some article of faith, some doctrine regulative of life but beyond the reach of proof or disproof by experiment or by argument, it is by no means indifferent whether it be the dictum of some supramundane personality or some theosopheme of a sect of mystics, the utterance of an inspired Apostle or the refinement of some ancient Babylonian myth. The interest of New Testament Criticism is not then merely academic; it does not appeal solely to the cognitive faculties, to the civilization-making instinct for knowledge as knowledge: its secondary and derivative but hardly less important interests concern our active natures as well and bear upon the whole front of our practical and institutional life.

The first inquiry that meets the student of any document concerns the text itself. Is this latter an original, or is it a copy? Or perhaps the copy of a copy? In either case, has it suffered any corruption, or is it a faithful transcript? In case there be many discrepant copies—the case actually presented—there will arise many questions as to the comparative age and authenticity of these copies, as to their relations to each other, and it will perhaps be necessary to reconstruct the supposed original from the contradictory attestations of these witnesses. Such is, in general, the text problem of New Testament Criticism, one of the most highly complex that ever challenged the efforts of the human understanding.

The testimony, which is enormous in amount, exists in the form of manuscripts, both uncials and cursives, in the supposedly original tongue (the Greek), of translations, as Latin, Syriac, Ethiopic, Armenian, Gothic, of citations by the early Christian writers, of lectionaries arranged for liturgical use, of capitulations and versifications or divisions into chapters and verses, and so on. The problem of sifting and evaluating such a mass of evidence and striking the golden mean of truth would seem too difficult for human intellect, especially as there is no secure foothold at any point, nor any sure way of testing our results as we proceed. In the end there is no court of final appeal, and the whole case must be left undecided. Under such circumstances the marvel would seem to be that there should be any agreement at all, that there should not be as many minds as critics.¹ However, extremely numerous as are the points of diverse judgment, where adjudication seems hopeless, the number of agreements is still far greater, where critical opinions rest harmoniously and undisturbed. Now it might be thought that this harmony would be extended and perfected by the discovery of new testimony, which of late years has proceeded apace, and by the deeper and minuter study of the long familiar evidence. But the fact is exactly the reverse. Accumulation of depositions and profounder investigations have confirmed some critical judgments, but have shaken many others and completely overthrown not a few. The problem is indeed becoming not less but more complicated with advancing knowledge, and the textual uncertainty was never before so great as it is now.

¹ So Jerome's aphorism: *tot enim sunt exemplaria pene quot codices*, in his Preface to the Gospel, addressed to Pope Damasus.

NEW TESTAMENT CRITICISM

True it is that the last generation has witnessed the most brilliant attempts¹ yet made to construct the most highly probable text. Those masterly scholars, Bishop Westcott and Dr. Hort, thought they might, by a careful study of the genealogy of the various witnesses, attach a coefficient of value to each one singly and in combination, and thereby determine the original text in the overwhelming majority of cases with a close approach to certainty. Plausible and seductive as was their argumentation, and thoroughly accepted even now in many high quarters, it was yet fatally defective at many points and for several reasons, and can no longer command scientific assent. The "neutral" text which they posited, as best represented by the great Vatican MS. B, is a figment of the imagination. The deference paid to certain great uncials was unwarranted. The testimony of the Fathers and the versions was undervalued. The depreciation of the so-called Western text was undeserved. The rash assumption that F was a copy of G was unfortunate.² Closer study has shown decisively that at crucial points the witnesses upon which Westcott and Hort relied most confidently might all be misleading, and the MSS. most lightly esteemed might present the older reading. Even as the shepherd boy of old laid low the giant, so at any time may some neglected cursive or version or citation by the Fathers overthrow the most venerated uncial. Thus, the all-important word *Παῖς*, in Rom. i. 7, 15, is attested by nearly all the best authorities; none the less it is an interpolation (Smith, J B L. 1901, Part I, p. 3 ff., Harnack, 'Preuschen's Zeitschrift' 1902, I, p. 83 f.). So, too, the position of the *Doxology* at the end of Rom. xvi. is witnessed by A B C D and the best versions; nevertheless the position at the end of xiv. is certainly the older. The Epilogue (xiv and xvi.) is given by nearly every authority, but, in spite of all, it is proved to be a later addendum; the Amiatinian and Fuldaian capitalizations clearly point to its earlier absence.³

These examples also correct very usefully a prevalent notion that textual variations are after all merely trifles, like the fading line between Imperfect and Aorist or the impalpable refinements of Greek syntax. On the contrary, they are sometimes blinding in their illumination, in their revelation of the primitive structure of our Scriptures.

Thus, the textual facts just stated involve a complete reconstruction of our notions about *Romans*, which now seems to be no Epistle and not addressed originally to Romans, but to be a compilation of moral and theological essays, first addressed to "all those in love of God," afterwards fitted out with Prologue and Epilogue as it now stands.

So, too, the extremely important F and G variant in Rom. ix. 22, unnoticed even by the best commentators (as Godet, Sanday, Weiss, Lipsius, Hofmann), indicates clearly the pure Judaic original of this famous chapter; the Christian hand has been laid on lightly and deftly but transfigures into a cosmic theory

what was at first only a Jewish patriot's explanation of the delay of divine vengeance upon "vessels of wrath," the Pagan oppressors of his people—an observation more fatal to theological libraries than the torch of Omar. See 'The Hibbert Journal,' 1, 2, pp. 328, 329.

Still another notion must be corrected. Let no one imagine that all or nearly all the variants are mistakes or due to mistakes; very many are visibly intentional. It was the ancient habit, particularly of the Oriental, to compile and re-compile, to edit and re-edit and re-edit again, and with sacred books this habit became almost an inviolable rule. No one disputes this fact in case of the Old Testament and the Apocrypha and the extra-canonical early Christian writings. It would be well-nigh miraculous, if the New Testament Scriptures should offer exceptions. Before the establishment of the Canon no sacred awe invested the canonicity, there was no apparent reason why the favorite Scriptures should not be systematically modified to keep pace with the developing Christian consciousness, very much as our creeds are altered nowadays.⁴

It is notorious that the Old Catholic heresy-hunters charged upon their opponents, Marcion, Valentinus, and the rest, that these latter had corrupted the Scriptures to suit their own heresies. The charge may often have been well-founded in the sense above defined, but it might undoubtedly have been retorted and was retorted with equal justice by the heretics upon the Orthodox. The great master, Hort, has himself said, in speaking of the "Doxology": "Indeed, 'copies corrupted by Marcion' need mean to us no more than 'copies agreeing in a certain reading with Marcion's copy.' . . . On the whole, it is reasonably certain that the omission is his only as having been transmitted by him, in other words, that it is a genuine ancient reading." Wetstein's great word holds good. "Various readings, almost all, are due to the zeal, ingenuity, and guesswork of transcribers." Tischendorf admits: "It can not be doubted that in the very earliest days of Christianity there were multifarious departures from the pure Scripture of the Apostles, wherein to be sure there entered naught of dishonesty or guile." Under the deeper probing of Von Soden and others the original "neutral" B-text of W.-H. turns out to be only a very learned revision; the fault of the great Vatican is that it has considered too curiously.⁵ It is impossible to blink the fact that all MSS. of all parts of the New Testament abound in readings that are plainly second thoughts. Our most ancient and revered codices reproduce only deformed, transformed, and highly elaborated originals. It is extremely noteworthy that the heretical readings are slowly coming to their rights, to be recognized as often more primitive, less subtly reflective forms. Thus in John i. 3 the Gnostics read: "And without him was made not one (thing). What was made in him was life," putting the full stop after *ἐν*, instead of after *τὸ* (was made); and their punctuation is at

¹ In the same spirit King James' Translators, in their 'Address to the Reader,' wrote wisely and well.

² As Holsten was led to observe—Holsten, the Doctor subtilissimus of Protestantism, the matchless master of exegesis, whose imposing reconstructions of Paulinism, by their very perfection, constitute the *ductio ad absurdum* of the premises and methods of his employers.

³ As by Tischendorf, Westcott and Hort, Weiss, von Soden.

NEW TESTAMENT CRITICISM

last adopted by W.-H. In a word, it can no longer be doubted that Scripture was made from Dogma, not Dogma from Scripture.¹

There is little reason then to hope for the establishment of a Received Text—the *ignis fatuus* of textual criticism, though not to despair of it be the last infirmity of noble minds. If such did not exist in the beginning, neither will it exist in the end. The discovery of new manuscripts, the collation of a few hundred more, will not bring the chaos to order but will make confusion worse confounded. Witness the publication of the Sinaitic Palimpsest in Syriac and the turning of attention to the famous Beza Codex, called D: they have merely raised new problems, not settled the old. It is perfectly just, then, and highly significant when Blass no longer quotes critical editions of the New Testament, but quotes the MSS. themselves, never presuming to say what is the "true text." Such in theory at least is the position to which criticism must finally come. The critic's text, no matter how ingeniously or plausibly "berichtigt," is only the critic's text, not the "true text," after all.

And is such a mouse-like conclusion the only issue of the mountainous labors of centuries? Shall we know from year to year less and less what was the original autographic legacy, "the pure Scripture of the Apostles"? True. But this "less" is yet in a higher sense infinitely more. For we now come to recognize clearly the prime error of our assumptions thus far, and immeasurable is the progress involved in this recognition. It has, in fact, been everywhere and everywhen tacitly assumed that there was in each case a unique autographic original, and that the problem of textual criticism was to discover that autograph, restore that original, and explain the manifold deviations therefrom. It is no reproach to criticism to have made this assumption and upheld it for centuries. No other was so natural or so plausible; none the less, it has proved unsatisfactory. In the face of the widening and multiplying diversities of the text-tradition, we can no longer range the Gospels and Epistles side by side with the Greek histories and the Letters of Cicero and ask how did Luke or Paul write it, just as we ask how did Thucydides or Plutarch or Pliny phrase it? In the Greek and Latin classics we recognize the works of the individual consciousness, here and there marred or corrupted, but each, in the main, single, solitary, self-consistent. Not so in the New Testament Scriptures. There we are confronted less with an individual than with a collective and communal consciousness. This consciousness is not always the same. By no means. It varies widely from the Synoptics to the Johannines, from the Paulines through the Catholics, to the Apocalypse. But it is nowhere individual, nowhere unitary, nowhere self-consistent;² it is everywhere communal, everywhere complicate, everywhere harmonistic. Indeed, Syncretism is by all odds the most con-

spicuous and impressive phenomenon it presents, a syncretism without a parallel in literature, unless in the Old Testament. In the latter the attempt has been made bravely and instructively, even if prematurely, to separate the components, to disentangle the "manifold wisdom" and distinguish the threads by colors. The time is not yet ripe for such an essay in the New Testament, but we may be sure that more than the seven primaries will be needed. The widely varying testimony of the MSS. greatly complicates the problem, while lending some aid in its solution. Perhaps it may be well to illustrate the state of the case by a few examples. Let us pass by the long familiar facts of the omission or varying position of the paragraph anent the Adulteress (John vii. 53—viii. 11), of the absence of the conclusion of Mark (xvi. 9-20), and many others, and fasten our eyes on the more massive fact that the variations in Acts are so extraordinary and omnipresent that the great master, Friedrich Blass, has been driven to the assumption of two originals, an α -text and a β -text. The remarkable peculiarities of the Beza Codex (D) had been noted by F. A. Bornemann as early as 1848, but critics did not follow him in regarding it as presenting the older text; its eccentricities were ascribed to the copyist, who, like the villain in the play, was thought capable of anything. Tischendorf, Westcott-Hort, and Weiss base their texts of Acts essentially on B and A C. It remained for Blass to show that this D was only one of many witnesses to a distinct Occidental text very widely ramified. It was as when one tugs mightily at some exposed root of a tree: the earth begins to stir everywhere on that side of the tree. Blass was led to think that two MSS. proceeded originally from Luke, one a memorandum (or draft) which he himself filled out into a book (the α -text or Antiochian form) for Theophilus. The draft, he thinks, remained as the β -text, at Rome, where it was elaborated into the Occidental text (*forma romana*). This theory of Blass has not maintained itself; it is naïve at many points, and it wrecks on many textual and other facts; but it has proved extremely valuable as bringing clearly to light the systematic differences of the MSS. and showing how a critic with ultra-conservative leanings (Blass dates Acts from 57-59 A.D.) is yet forced to the assumption of two primitive texts. Let one citation indicate the interval between them.

Acts xxvii. 1 (α -text): "And as it was determined for us to sail unto Italy, they were delivering both Paul and some other prisoners to a centurion by name Julius, of the Cohort Augustan."

(β -text): "So therefore the governor decided for him to be sent to Caesar, and on the morrow, having summoned a certain centurion of the Cohort Augustan, by name Julius, he delivered to him Paul with the remaining prisoners."

It remains to add that Blass has found it necessary to distinguish two texts, α and β , in Luke's Gospel as well as in Acts.

The criticism of this eminent philologist, though not attaining quite the goal proposed, may be said to mark the beginning of the end of well-meant efforts to reconstruct the unitary autographic originals of the New Testament

¹ It is indeed plain on its face that a doctrine must in general antedate its literary expression, and when we find this expression in a highly composite, apophthegmatic form, we may be sure it has been forged on the common anvil beneath the alternate strokes of more than one hammer.

² Unless, perhaps, in the unicapitulars, as Philémon, Jude, & John.

NEW TESTAMENT CRITICISM

Scriptures. The notably complex character of these latter comes out daily more and more clearly. The Baurian criticism had left the Apocalypses and the four chief Paulines as the primary and irresolvable literary records of the Apostolic Age, by which all others were to be measured and appraised. Of this sacred pentagram it was the analysis of Völter and Vischer that dissolved the first corner. These critics, especially the latter, have exhibited the Apocalypses as primarily a Judaic composition, itself highly composite, which has been overworked and christianized by one or more Christian hands. The still deeper digging of Gunkel, Bousset, Zimmern, and Jeremias has brought to light a considerable amount of exceedingly primitive, even Babylonian, mythical material, which had been cast into the alembic of the Apocalypticist. On the other hand, the extremely complex character of Romans has come clearly into evidence. Spitta has found it necessary to break it up into two Epistles; the great Lightfoot, while rejecting the crude attempt of Renan, found himself constrained to propound a theory of a Shorter Recension. Völter surrendered the unity unconditionally, and Van Manen the Paulinity in his elaborate work on *Paulus*, though he had defended it against Loman. Steck also in his widely read and very readable *Galaterebrief*. More piercing was the analysis of Piereson and Naber in their remarkable *Verisimilitudo*, which in spirit and principle is the most advanced of European critical productions. Independently of the foregoing, and following other methods, the present writer has exposed the concretionary structure of Romans in a series of monographs, with sufficient clearness. It can hardly be doubted that similar results await the application of similar methods to Corinthians and Galatians. Indeed it was said years ago in the *Theol. Jahresb.*, "The 2 Cor. Letter will no longer hold together."

In Romans the presence of a large body of ancient Judaic originals seems now made out. The conservative J. Rendel Harris perceives that the list of sins (Rom. i. 29-32) is based upon an ancient Jewish Vidui (Confession for the day of Atonement).¹ The same must, of course, be said of the similar list in 2 Tim. iii. 2-5. The searching analysis of Spitta and Maschke shows clearly that the Epistle of James is almost wholly Judaic, christianized by a few insignificant interpolations.

The problem of discovering the original elements, often Jewish, of the New Testament compositions, has been propounded only recently and has not yet advanced far towards solution. But the progress already made is most encouraging. That way lies truth—of this the day for doubt seems gone forever.

Closely connected with this quest is another, for the sources of the Scripture quotations attributed to the Gnostics by the Fathers. Thus far it has been held unsuspectingly that the Gnostics quoted from our Canonics or from parallel, still later sources. Inasmuch as the matter is of fundamental importance, it has appeared well to the writer to subject it to a minute and exhaustive investigation, which should include primarily Hippolytus, Irenæus, Tertullian, and Clement of Alexandria. As a re-

sult of this investigation, though not yet completed, it may be declared that no evidence has yet come to light that the Gnostics ever used our Canonics; on the contrary, it appears certain that the Gnostics derived largely from sources now lost but certainly presenting much of our present canonic matter in a cruder, more primitive, less elaborate form. By every token these sources contained this matter in far more natural connection than it appears in at present. The new light that is thus thrown upon the anharmonies and asyndeta of the New Testament is often surprising. The transformations are often complete and effected in queerly ingenious manner. We now begin to feel the force of the oracle in Matt. xiii. 32: "Every scribe disciplined for the kingdom of the heavens is like unto a householder that brings forth from his treasure things new and things old." A few examples must here suffice. In Matt. xiii. 3-9, Mark iv. 3-9, Luke viii. 5-8, we read the Parable of the Sower. In Matt. xiii. 19-23, Mc. iv. 14-20, Luke viii. 11-15, it is carefully expounded. The seed is declared to be "the Logos of God," the Sower is not interpreted, but is left to be understood of the Jesus or indeed of any preacher of the Gospel. Critics, even the keenest, as Koetsveld, Jülicher, Bugge, have never yet been able to satisfy even themselves concerning the interpretation, still less concerning the expressed design of the parables, to blind the hearers. Jülicher declares this latter to be impossible, especially for Jesus, and puts the dilemma sharply: "Either the Evangelists or Jesus." No solution is found in the New Testament, but on turning to Hippolytus (*Philosophumena*, v. 8) we find given as a "saying" of the oldest pre-Christian Gnostics, the Naassenes, the following *Allegory of Creation*: "Forth went the Sower for to sow: And some fell by the wayside and were trodden down; and some upon the stony places and sprang up (he says), and through not having depth were withered and died; and some fell (he says) upon the earth the fair and good and made fruit; some a hundred and some sixty and some thirty. Who hath ears to hear, let him hear." . . . Here the Sower is none other than God himself; the seed is the Logos, the spermatic Logos, the seminal Reason of the Stoics; the three classes are the elsewhere familiar Choics, Psychics, Pneumatics (all known to the New Testament), otherwise named the Captives, the Called, the Chosen. (A paper read by the writer before the Society of Biblical Literature and Exegesis, New York 28 Dec. 1904.)

In the Gospels the phraseology has been expanded and enlivened, the Hebraism "in his sowing" (*ἐν τῷ σπέρματι αὐτοῦ*) has intruded itself from the Lucan source, a 4th class has been inserted in the 3d (by Justin in the 2d) place, and the application made is entirely new.

In Matt. vii. 13, 14, we read the famous exhortation as to the gates: "Enter ye in by the narrow gate: for wide (is the gate), and broad is the way, that leadeth to destruction, and many be they that enter in thereby. For [how] narrow is the gate, and straitened the way, that leadeth unto life, and few be they that find it." The passage is quite unconnected with its context; there is never any hint as to interpretation; it is a mystery even to Zahn; it is impossi-

¹ *The Teaching of the Apostles*, pp. 52-7.

ble in its present setting. But in Hippolytus (op. cit., v. 8) we find the Eleusinian doctrine of the two gates: the one into the lower common life of flesh and soul, through which all enter at birth, the other into the higher life of spirit, through which only the initiates may fare; then is given as a saying of "the Saviour" the following: "Concerning these (he says) expressly hath spoken the Saviour, that narrow and straitened is the way that leadeth into life, and few are they that fare in into it; broad though and wide the way that leads unto destruction, and many are they that fare through through it." The doctrine of the "Two Ways" was a favorite of antiquity, but no nobler interpretation than this has yet been found. It must not be supposed that the use of the term "The Saviour" (*ὁ Σωτήρ*) presupposes the Gospel or Christianity. The term is not a New Testament favorite, occurring (save in Luke i. 47, ii. 11, Acts v. 31, xiii. 23) only in the so-called later Scriptures (19 times, 6 times in Titus); it has been shut out, then, from the Gospel tradition, perhaps as a current heathen designation of gods or even kings. With the Gnostics it was greatly preferred, while the Fathers substitute for it the name Lord *Κύριος*, *Dominus*. Its Greek use goes back at least to Æschylus and Pindar, and in its technical sense it was pre-Christian. The battle-cry of the Greeks at Cunaxa was "*Zeus Σωτήρ καὶ Νίκη*" (Xen. Anab. I, 8, 16).

Again, the doctrine of judging the tree by its fruits finds large space in the Gospels. Thus Matt. vii. 16, "Do they gather grapes from thorns or figs from thistles?" and Luke vi. 44, "For of thorns they gather not figs, nor of bramble harvest grapes." Here is an excellent answer to the oft-recurring question, which of two or more forms is the original? Plainly, both—and neither. They are variants upon an aphorism repeatedly met with in the classics. Says Plutarch, "We do not expect the vine to bear figs nor the olive clusters." *Τὸ ἀμπελον οὐκ ἐλπίσθαι ἐκδοῦναι ὄβελον ἢ καὶ ὄλκην ὅστις ἔστω.* *De Tranquillitate Animi*, XIII. (472, F). Ovid, too, *De Arte Amandi*, I, 747.

*Siquis idem sperat, jacturas poma myricas
Speret, et in medio flumine mella petat.*

"If any hopes this, let him hope tamarisks will bear apples, and let him search for honey in the river's mid."

These classic parallels suggest the important question: How much of the New Testament exists under other form in profane literature? The question has not yet received complete answer, which could hardly fail to prove very illuminative.

From all of the foregoing it appears that we must not judge the New Testament by the same standards we apply to the products of individual genius. It is the life of ages and of whole peoples that is concentrated in that volume. It is the gradual precipitate of the moral, religious, and philosophic consciousness of three and a half centuries—a time and two times and the dividing of a time—that is stratified in that wonderful book. To this slow deposit nearly the whole circum-mediterranean region would seem to have made contribution. Certain it is that Rome and Athens and Ephesus and Antioch and Alexandria will bear honorable men-

tion by the side of Palestine and Jerusalem, not yet to include Persia and India.¹ It is the mighty Mother, it is Universal Humanity, that has brought forth this prodigious birth through the long travail of a third of a millennium.

The new aspect under which the critical problem now appears, effects a remarkable transvaluation of values. The great critical movement may be said to have begun, ineffectually to be sure, in the great year 1792 with *The Dissonance of the four generally received Evangelists, and the evidence of their respective authenticity examined*. By Edward Evanson, A.M.—Ipswich. Evanson was bold enough to reject Matthew, Mark, and John, along with many of the Epistles, for reasons never sound but not always unworthy of serious attention. Of course, he held the spurious Scriptures to be later in origin. In 1820 'Probabilia de Evangelii et Epistolarum Joannis, Apostoli, indole et origine eruditorum judiciis modeste subjecit Carolus Theoph. Bretschneider.' The author concludes at the end of 224 well-reasoned pages that the fourth Evangelist was "certainly neither John the Apostle, nor a companion of Jesus, nor a Christian sprung from Palestine and living there, nor a born Jew, but some other Christian skilled in Alexandrine doctrine, a presbyter (as he himself professes in later epistles), who in writing it (exarando) made use of both tradition and a written book. Most probably he lived in Egypt."

The author, who so modestly submitted this book to the judgment of the learned; afterwards still more timidly recanted; nevertheless it brought "eternal honor to his name." His arguments were repeatedly answered in detail, hardly in their entirety. But before and beside these two negative judgments as to the sources, there had spread itself an all-embracing skepticism anent the miraculous contents of the New Testament story. In the hands of the English Deists it took the form of mere mockery, of contemptuous denial or disproof, with little or no attempt to understand them genetically, and beyond this stage it has in many cases not advanced even to this day. But the tenderer, more sympathetic, German spirit sought earnestly to interpret the miraculous narratives, to show how they arose, to make clear what forms of religious consciousness had produced them. In this striving there was a possible basis for a steadily progressive intelligent critique and ultimate understanding of the New Testament, while in the brutal English negation there was none.

This German Rationalism had not gone to such alarming lengths without deadly violence no less to the spirit than to the letter of the sacred narratives, but it had been so insidious as to have remained almost unconscious of itself. It was Strauss who in his 'Leben Jesu kritisch untersucht' (1835) rather roughly tore away the mask and showed the "very Age and Bodie of the Time, his forme and pressure." But the

¹ For Persia the monumental work of Cumont is fundamental and exhaustive. Leaving aside the surmises and parallels of Srydel and Hopkins ("Christ in India," in his 'India Old and New,' 1901), compare the circumspicuous dissertation of Van den Bergh van Eysinga, 'Indische invloeden op oude Christelijke verhalen' (1901), and articles by Oldenberg in the *Theologische Literaturzeitung* and the *Deutsche Rundschau*. See Edmunds' "Buddhist and Christian Gospels" (1905).

NEW TESTAMENT CRITICISM

criticism of Strauss touched almost solely the contents of the Gospels, the profounder question of the sources it did hardly moot. Hence there was not only place but imperative call for Baur and the Tübingen School, with whom New Testament criticism in the more modern sense may be said to have begun.

The influence of their penetrating researches was clearly seen a generation later in Strauss's second 'Life of Jesus for the German People' (1864), less so in the brilliant romance of Renan, 'La Vie de Jésus,' in which keen sympathy, lively fancy, and perfect style vainly strove to supply the place of exact scientific criticism. Meantime another great voice in theology, Albrecht Ritschl's, had in his 'Entstehung der altkatholischen Kirche' (1857) openly renounced the Baurian two-term formula, Paulinism *versus* Petrinism, as unequal to the expression of the facts of early Christianity, and had founded the Ritschlian School, whose leaf even in the fifth decade is still green.

Practically all of this high argument, stretching through 70 years, has turned upon questions of date and authorship. The gravamen of the Tübingen contention consisted in referring the bulk of the New Testament to the second century and construing it as pseudopigraphic and in some sense born of the Paul-Petrine controversy, reflecting it, or solving it, or smoothing it away. On the other hand, the Conservatives, largely aided by Ritschlians, held more or less firmly to the traditionary first century dates and authorship and minimized the antagonism between Jewish and Gentile Christianity.

All this has now been greatly changed. Dates and authors are not indeed unimportant, but they are no longer of prime significance. This follows at once from the principles already enunciated. If these much-debated compositions be really so highly compounded, then their dates and authors are not precisely determinable. Even if it were possible to discover the ultimate or the penultimate reviser, the question would remain as to the extent of his own contribution to the final whole; the fact that he wrote 150 A.D. might very well consist with the fact that some or most of his material appeared even in written form 150 A.C. Thus the units of the New Testament compound seem dissolving under our hands like an atom of radium, but without apparent loss of energy. With this regard the large enterprises of such as Volkmar and Zahn and Hilgenfeld are alike turned awry. At the same time, from this higher view point we can see the partial justification of opposing theories, the half-truth in each term of the contradiction. Radicalism has been right in detecting indications of late origin in many or all of these canonic Scriptures; Conservatism has been equally right in emphasizing the presence of more far older elements. But neither the one nor the other has been justified in any inference from one part to its neighboring part, much less to the whole. Side by side in the faulted and folded strata of a mountain range we may find fossils separated by many thousands of years. Though the apocalyptic prophecies of Mark xiii. be written before the catastrophe of Jerusalem, nothing follows as to the rest of the Gospel, which may have been written much later. Why

may they not have been written, at least in part, a hundred years earlier? They are not foretelling a *second* coming, but only *The Coming* of the Son of Man. Again, even if part of the parallels in Matthew and Luke do presuppose that catastrophe, which quivers still here and there in Matthew (Harnack, Chron., p. 654), it remains none the less true that these vivid pencilings may be only later touches of a revising hand. The body of the picture may still be generations older. In studying these Scriptures we are exploring the tossed ruins of a world, and each fragment must stand on its own merits. Questions then of age and authorship must still present themselves continually, but not under the old familiar forms.

There are two elements in the New Testament that are especially subject to considerations like the preceding: the philosophic, or rather theosophic,¹ and the gnomic. These are present in large measure, even in portions mainly personal and narrative. With respect to both it seems reasonably certain that the age is often very great. The theosophic doctrines repeat themselves under endlessly varying forms in Gnosticism. This latter phenomenon is now referred with increasing positiveness and definiteness to the first Christian and even pre-Christian century. Its wide-reaching roots stretch themselves away back into the alluvium of the Tigris and the Euphrates (see Anz, 'Ursprung des Gnostizismus'). As an offshoot or outgrowth or "acute secularization" (Harnack, D. G. I. 232) of Christianity, it is wholly inconceivable. The great historian of dogma himself annuls his own contention by recognizing a boundless extent of *Vorstufen* (op. cit., p. 226, 231 f.) for his secularization. These prestages were confessedly pre-Christian, or at the very latest syn-Christian, and since they contained demonstrably and indisputably in this form or in that nearly the whole body of New Testament theosophism and much more, it follows irresistibly that the derivation of Gnosticism from Christianity is in every sense impossible. The two historical products were practically synchronous; since many of the Gnostic central thoughts were certainly centuries pre-Christian, it may be possible to regard Christianity as emerging from Gnosticism, but it is surely impossible any longer to regard Gnosticism as diverging from Christianity. To this general state of case there is explicit testimony in the book of Acts in chapter viii. 9-24, where Simon Magus is represented as an elder contemporary of Peter and Philip. The first preaching of the Gospel in Samaria found him already pre-occupying the ground, for many years he had been amazing the Samaritans, proclaiming some doctrine about the "Power of God, that called Mighty," which we know to be a Gnostic slogan. Now this Simon figures in the Fathers as the wellhead of Gnostic heresy; and it was both the habit and the dogmatic necessity of the Fathers to post-date, never to pre-date, the Heresies. Harnack admits the historicity and antiquity as well as the epic grandeur of Simon's attempt at universal religion. Strangely he regards this heresiarch, who had at the first preaching of the Cross for a "long time" been so omnipotent among the

¹ But we speak divine wisdom (*Oneo sophia*) in mystery. 1 Cor. II. 7.

Samaritans as to be considered by them a god — this precursor of Peter he regards as a "counterpart to Jesus" (Gegenbild zu Jesus). That Simonism was the elder is clearly indicated in Acts viii 13, where Simon accepts the preaching of the Gospel, believes, is baptized, and attaches himself devotedly to Philip (*ἑσπασαμένῳ τῷ Φίλιππῳ*). The close affinity of Simon's preaching with Peter's is unmistakably hinted in the disclaimer of Peter (viii 21), "There is not for thee part or lot in this Word." Moreover, we know from Origen (C. Cels. V., 6a) that Simonism was, at least with the Gentiles, one of many names for Christians. This is not nearly all, however. We learn from Hippolytus that Simon was far from being the fountain-source of Gnostic heresy, at least of Gnosticism. He appears as only fifth in the chronological list. The first, antedating Gnosticism itself, and only later called Gnostics, are the all-important Naassenes, whence all the rest (Hipp. Phil. v. 6). Compared with Naassanism, Simonism is visibly and palpably a much later development. Hence Naassanism is thrown back beyond the beginning of our era. There is no evading this argument *a fortiori*; witness the utter bewilderment of Bunsen in his Tabulation ("Hippolytus and his Age," I, p. 236), where he says the Gnostics (Hipp.'s I-IV.) originated 70-99 A.D., but the later Simon belonged to the first age (27 to 65)!! With this early dating, and only therewith, do all the phenomena correspond. Now in this archaic prognosticism we find already present, however mchoate, a goodly company of the most important and characteristic New Testament ideas: the Son of Man (Humanity = bar-nasha), the Man from Heaven, Citizen of Heaven, the Father, the new Jerusalem, the Chosen, the Psychics, the Pneumatics, the Captives (Luke iv. 18; Rom. vii. 23), the Called, the Chosen, the Perfect, the Spirit, the new Birth, the Christ, the Jesus — all of these and more march in proud procession through the pages of Naassanism. The name *Jesus* for the Son of God is used in one of their hymns, which we have no reason for supposing post-Christian, which Harnack and Preuschen declare to be "ein naassensischer jedenfalls alter Psalm" ("Die Ueberlieferung und der Bestand der alchristlichen Literatur," p. 168).

The momentous fact confirmatory is that all these notions are used in the New Testament as perfectly familiar, needing no explanation. This presupposes that these notions already had a history lying behind them. We may be perfectly sure that they had been formed and defined and bandied about in frequent discussion long before they became encysted in apophthegms of the earliest Christian literature.

With respect to the gnomic element the case is quite as strong. The starry words of the New Testament are evidently stones that have been polished to perfection by the attrition of ages. That this literary peculiarity is due to the personality of Jesus can not be maintained. For since he must have spoken in Aramæan, not in Greek, the forms we have could be only translations. As reproducing words actually used by him, the renderings of Dalman and others have little value. Jesus and the Baptist are thought of as strongly contrasted, almost antipodal; but the style of the one is hardly

distinguishable from the style of the other. Both denounce the Pharisees as "generations of vipers" (Matt. iii 7, xxiii. 33), both use precisely the same words about the Tree and the Fire (Matt. iii. 10, vii. 19). The variations found in the synoptic reports are precisely what might be expected in such anthologies. Let any one compare corresponding proverbs in sister languages or even different forms in the same language, for example, as given in Bartlett's "Dictionary of Quotations," and he will find almost exactly the same phenomena presented.

At this point the recent papyrus finds, with their new "Sayings of (the) Jesus," are of striking interest.¹ Clearly they are but *disiecta membra* of a once imposing organism. Such Logoi (not Logia) undoubtedly existed in that elder day in countless number. Oblivion has swallowed them up, as it has swallowed up so much of ancient literature. Here and there some few have escaped and are seen *rari nantes in gurgite vasto*. The salvage of our canonic is like the Seven Tragedies of Sophocles — 7 out of 801. We may rejoice, however, in the belief that what has survived is the best — not all of it the best, nor all of the best, — but on the whole the most worth saving. The Christian consciousness has sifted and refuted, has tested the spirits whether they be of God; it has polished and refined, has set and reset the precious stones, until the great citadel of its faith gleams and flashes like the bejeweled gater of the New Jerusalem.

Examples of the long-continued process of perfectionment lie open to behold in our Gospels. Thus, in Luke vi. 17 the Jesus descends into a plain and teaches a great multitude eagerly pressing upon him. But in Matt. v. 1 he withdraws from the multitude into "the mountain" (of new legislation) and teaches "the disciples" only. In Luke vi. 20 he declares, "Blessed the poor, for yours is the kingdom of God," but in Matt., "Blessed the poor in spirit, for theirs is the kingdom of the heavens." In Luke, "Blessed they that hunger now, for ye shall be filled"; but in Matt., "Blessed they that hunger and thirst for righteousness, for they shall be filled." In Luke, "Blessed they that weep now, for ye shall laugh"; but Matt., "Blessed they that mourn, for they shall be comforted." So, too, Matthew omits the "Woes" in Luke, supplying other beautiful beatitudes. That the Lucan form is older and has been immensely spiritualized in Matthew is too plain for argument, though it is not affirmed and not probable that Matthew has derived directly from Luke. Notice, too, that "they that mourn," "the meek shall inherit the earth," "they that thirst," "the pure in heart" are all Old Testament gems (Is. lxi. 2, Ps. xxxvii 11, Is. lv. 1, Jer. xxxi. 24, Ps. xxiv. 3, 4) gathered into a new brilliant. Compare also Ps. cix. 28, cxvi. 5, 6 for the Lucan contrasts of weeping and laughing, cursing and blessing.

The primary form of the angelic song (L. ii. 14), it is now admitted, was: "Glory on high to God, and on earth peace among men of (His) good will," that is, His people Israel. Surely it is not hard to forgive the scribe who, by the omission of a single letter, *e*, of the last

¹ The formula "(The) Jesus says" seems to stand on precisely the same footing as the Old Testament parallels, "Thus saith Jehovah," and the like. Against Soltau.

word, transformed it into "Glory on high to God, and on earth peace, among men good will."

Once more, the zenith of moral sublimity, before which Rousseau justly exclaimed, "Socrates died like a philosopher but Jesus like a God," is attained in the prayer on the cross: "Father, forgive them, for they know not what they do." Nevertheless, it is now bracketed by Lachmann and Westcott and Hort as a "Western" interpolation. Finally, mark how the Lord's Prayer as given in Luke (xi. 2-4) has been expanded and ennobled in Matthew (vi. 9-13).

Such examples, which may be multiplied indefinitely, may teach us how erroneous it is to suppose that the extra-canonical "Sayings" are less primitive, because less perfect in form and substance; on the contrary, their comparative crudity far more reasonably argues their comparative originality: "first blade, then ear, then full corn in the ear" (Mark iv. 28).

We come now still nearer the heart of the matter. In most of the foregoing we may hope for the general concurrence of critics, save such as Noagen of Rostock. Few of the enlightened would now deny that the general mind of "the Church" has been largely formative of our present Scriptures. The more advanced would concede that it has even taken an active part in shaping the canonical "Biographies" of Jesus. The recent powerful and convincing work of Wrede admits no doubt on this point. Hear some of his emphasized conclusions: "To write a Life of Jesus meant for Mark not to report something about Jesus, it meant rather quite simply to narrate a life full of Messianic manifestations" ("Das Messiasgeheimnis in den Evangelien," 1901, p. 125.) Again, p. 129: "The evangelic research of to-day proceeds throughout on the supposition that Mark in his historical narrative has the actual circumstances of the life of Jesus before his eyes, approximately distinctly, if not uninterruptedly. It presumes that he thinks outward from the Life of Jesus, that he motivates the individual features of his history according to the real circumstances of this life, according to the real thoughts and feelings of Jesus, that he concatenates in historic-psychologic sense the events that he sketches. In accord herewith it interprets, and in accord herewith it criticizes the Gospel in detail. It assumes, to be sure, chronologic displacements, inaccuracies as to fact, alterations in the verbiage of utterances ascribed to Jesus, also an addendum of later dogmatic conception. But yet it operates everywhere with the psychologic necessities and probabilities that held for the personal actors in the given situations, it motivates in accordance therewith, it supplements the accounts with the consequences that flow therefrom naturally, and so covers with flesh the skeleton of dry dates. *This view and this procedure must be recognized as false in principle. It must be said openly: Mark has no longer any conception (Anschauung) of the historical Life of Jesus.*"

This is certainly one of the very most important deliverances of recent criticism. The characterization of the prevailing investigation of the Gospels is perfect, but it is unfortunate that Wrede has contented himself with a bare negation, however unshakably established.

"Herewith I will by no means prejudice the historic character of the materials, which I have not investigated. These materials may here be disregarded entirely" (p. 129). The same prevalent attitude has been clearly stated by Pfleiderer, though in much broader outline, when he declares with Strauss (against Ullmann) "the Christ of the Gospels is a creation of the faith of the church, but this faith an effect of the person of the historical Jesus." . . . "Historical science, which is concerned to understand Jesus as the originating source of Christianity" Harnack, while strenuously maximizing the trustworthiness of the Gospels in der *Hauptsache*, admits that, "however, here and there are mirrored even in them the conditions of the original community and the experiences through which it passed in later times" (p. 15). In other words, the later apostolic Christian consciousness transfigured more or less the primitive "Life of Jesus." Harnack would perhaps use still stronger language after reading Wrede. So we might go on quoting Feine, Bouasset, Weiss, Keim, Jülicher, Holtzmann, Weizsäcker, Gunkel, Meinhöf, and the rest. Enough. The transforming activity of the early Christian consciousness they do not deny; how high it is to be rated is yet unsettled; but after Wrede's work it will never again be rated so low as before.

Nevertheless, all these critics up to this time are harmonious on one point, however discordant as to others; they will all agree with their great spokesman, Pfleiderer, that the end and aim of the historical science of the New Testament "is to understand Jesus as the originating source of Christianity." How seriously historical science has taken this problem is above all evident in the great number of works, by men of first-class ability and intensely in earnest, bearing the title *Life of Jesus* or *Life of Christ*. "Das Leben Jesu" was the title of the great apocalypse of David Friedrich Strauss. Since then we have had Renan's, and Keim's, and Weiss's, and Hase's, and Holtzmann's, and Réville's, and the like, not to mention Farrar's, and Geikie's, and Edersheim's. Even Volkmar, who, in his "Marcus," had, along with Hoekstra and Loman, broken the path since trodden by Wrede, resolving so much of the biography into symbolism, *Lehrgedichte*, and the like, even Volkmar must yet write his *Jesus Nazarenus*, sounding often like a recantation.¹ More than one of these works was of signal ability. Keim's was pre-eminently able. But even where no formal "Life" was written, if the writer attempted any construction or interpretation of primitive Christianity, it was uniformly in terms of the Personality of Jesus. The consciousness of the Christ—that was the oldest Christianity, and, barring the acknowledged imperfection of the means and agents of transmission, that was the content of the Gospel as to us transmitted.

Here at least there is nothing in debate. Surely the problem has been clearly and definitely conceived; it has been firmly and reso-

¹ A like remarkable influence of critical consciousness made itself known in Loman, the Tübingen of the North, especially in controversy with Scholten. There have been critics, beside whom must be named their unhappy master, Bruno Bauer, had strange forebodings, extraordinary glimpses of the truth—they saw visions, they dreamed dreams. But their glittering structures lacked the solid foundation of scientific fact. No wonder then that they have sunk in a heap.

lutely grasped; the materials for solution are not lacking in abundance; the expenditure of the widest, deepest, exactest learning, of zeal and abilities of the highest order, has been prodigal, and the methods employed have been infinitely varied;—what then, we may and we must ask, has been the net result? The answer can not be doubtful, absolutely nil! There is no exaggeration in this statement. Thus far it has been found utterly impossible to rationalize the Life of Jesus. Certain negative critical results have obtained more or less general recognition in critical circles, but they do not, however sure apparently, help us in the least "to understand Jesus as the originating source of Christianity." On the contrary, they tend rather to make such understanding less and less possible. The theories developed in such capital works as Pfeiderer's 'Das Urchristenthum,' or Harnack's 'Das Wesen des Christentums,' or Heinrich's 'Das Urchristenthum,' or Réville's 'Jésus de Nazareth,' or McGiffert's 'The Apostolic Age,' or the cognate treatises of Schurer, Hausrath, Weizsäcker, Votaw, and others, though lasting monuments of erudition, though brimful of ingenuity and sagacity, though widely illuminative and always pressing out further and further the bounds of our knowledge—all such are none the less disappointing as regards the capital point. In the last resort they are all equally impotent to make the Christian movement comprehensible or credible as an emanation from a personal focus, as a reaction from the Life and Death of the Man Christ Jesus. We might illustrate this fact by abundant citation, but there is no need to carry owls to Athens. Not one but must in the end beg the whole question, must abdicate the whole task, by assuming some uniqueness in this Personality, some absolute disparateness and incomparability with all other humanity. In other words, when under their inexorable analysis every trace of the miraculous¹ has vanished alike from Gospels and Acts, from Epistles and Apocalypse, there remains unshaken in tremendous majesty the one supreme Miracle of Miracles, the Heart of Heart in the New Testament, without Whom all other miracles are vain and contradictory, with Whom they acquire consistency and awful significance. The crumbling away of these outer parapets but lifts aloft into still bolder relief the impregnable strength of this inmost citadel.

The case then stands thus:

If Jesus be such a unique Personality as everywhere demanded by critical theory, in last analysis incomparable with the sons of men, then He was in some sense superhuman, it makes no difference in what sense, and neither His words nor His deeds are to be measured by the standard of men. Hence His miracles, one and all, remain miracles but cease to be wonders. We know of no reason why He should not have been born of a virgin, and walked on the waves, and raised the dead, and ascended into heaven, and endowed His disciples with any desirable spiritual gifts, and transmitted the Power of the Keys to an endless series

of infallible viceregents. Nay, it becomes antecedently highly probable that He would and did do all this and much more; we should reasonably expect such a unique extra-natural being to do unique extra-natural things. We have no ground at all, then, for extruding or slurring or minimizing the non-natural element in the Scriptures, but every ground for retaining and accenting and even magnifying it. Accordingly, the strictly orthodox view appears alone consistent and rational, the liberal theology must ultimately commit suicide, however skilfully it may postpone the denouement to the last page of the last chapter. The unescapable question, "What think ye of the Christ?" must sooner or later precipitate the catastrophe. Greatly then as we admire and applaud the most enlightened scholarship of Europe and America, we must admit that at this critical pivotal point it has no standing before the bar of logic. This year-and-nay criticism has now for years been bankrupt.

When so many winged hounds of Zeus thus find that their quarry forever eludes them, the suggestion is inevitable that there is something radically wrong in their method of pursuit, that in some way their finest sense has betrayed them. We hold that the nature of their error is now at length an open secret. They have sought to explain Christianity as an emanation from a single individual human focus, as the reaction upon history and environment of a single human personality, they have sought "to understand Jesus as the originating source of Christianity"—they have failed and they must forever fail: for no such explanation is possible, because no such origination was real. Over against all such attempts we oppose the fact that every day comes to clearer and clearer light, that now flashes continually into evidence around the whole horizon of investigation, the fact that was perceived nearly a decade ago, but whose effective proclamation called for the publication of a series of preparatory investigations, the fact that the Genesis of Christianity must be sought in the collective consciousness of the first Christian and immediately pre-Christian centuries, that in the Syncretism of that epoch of the amalgamation of faiths, when all the currents of philosophic and theosophic thought dashed together their waters in the vast basin of the Roman circummediterranean empire, was to be sought and found the possibility and the actuality of a new faith of Universal Humanity, that should contain something appealing to the head and the heart of all men, from slave to emperor, a faith in which there should be no longer male and female, Jew and Greek, bond and free, but all should be one by virtue of a common Humanity, of the ageless, timeless, spaceless Son of Man.² It is as the outcome of this Syncretism, as the final efflorescence of the Judæo-Greco-Roman Spirit, of the Asiatic-European Soul, that Christianity is wholly intelligible and infinitely significant; the notion that it is an individual Palestinian product is the *Carthago delenda* of New Testament criticism.

That the drift of the most advancing thought and the most penetrating research is all in the direction indicated, can not escape the notice of the reader of the most recent

¹ Even criticism in the bosom of the Church of England spares no labour or at most but four of the miracles: The Incarnation and the Resurrection, with their "incidents," the virgin Birth and the Ascension. See the recent controversy in 'The Nineteenth Century and After.'

NEW TESTAMENT CRITICISM

works of such as Pfeiderer, Gunkel, Bousset, Zimmern, Heitmüller, Dieterich, Seeberg, Wrede, Kreyenbühl, Usener, and their peers. Such is the unmistakable trend of historico-religious investigation. But this latter is very slow, and naturally very slow, to cut loose from the ancient moorings, to weigh anchor and commit itself to seas entirely unknown. Thus even Gunkel hesitated long ("nach langem Zaudern und manchen Erwägungen") before publishing his 'Zum religionsgeschichtlichen Verständnis des Neuen Testaments' (1903). He has therein spoken out bravely the great word (p. 95), "Christianity is a syncretic religion," even as Bousset had already declared: "Judaism, however, was the retort in which the different elements were assembled" (Rel. d. Judentums, p. 493).¹ Nevertheless, Gunkel tells us "all this has been transferred to Jesus," "When then Jesus appeared in his superhuman sublimity," and it avails little to add "that the christologic problem of the present is not merely historic and can not be solved in purely historical way"; so that, after all, we are advanced hardly an inch beyond the elder standpoint. In the same spirit Wernle declares that "Paul's utterance concerning Jesus was at bottom a myth, a drama, to which Jesus gave the name" (320). None the less, Wernle still deduces Christianity from this uniquely but merely human Jesus.

The amazing state of case, then, is this: The most piercing criticism detects nearly the whole body of Christian doctrine and practice in the mixed religions of the day, even the sacraments themselves. None of this, it feels sure, "can be derived from the teaching of Jesus; they show us how Christianity in its infancy was drawn into the chaos of Oriental religions" (Wernle). Nevertheless, it assures us that this teaching, *this* Jesus, remains the heart's core of Christianity. When now we ask, what then was this teaching, what this Personality? the answer rendered is arbitrariness itself. Since the critic feels constrained to explain 99 per cent of Christian theory and practice as derived from Judæo-pagan sources, as merely "transferred to Jesus," he is at liberty to choose the remaining 1 per cent as he will; he makes of the teaching precisely what he thinks it ought to have been, he declares Jesus did or did not teach this or that, because it conforms or does not conform to his idea of Jesus! But whence this idea? Certainly not from the Gospels, for these are saturated through and through with "transferred" elements; the only one that professes to be based on personal knowledge, the Fourth, is exactly the one that is rejected *in toto* as history, even by such a conservative critic as Harnack ("Especially the Fourth Gospel . . . can not be used as an historic source in the ordinary sense of the word" — D. W. d. C., p. 13)! No standard, then, is left but the caprice of the critic; he makes his own Jesus and conforms the Gospel thereto! If the Gospel contains contradictory or superfluous elements, they have been imported from the surrounding "chaos"! If it omits certain necessary or desirable features, it was because the religious consciousness of the writers was not free to assimilate them, but was bound fast by the his-

torical conditions that obtained! It is plain at a glance that nothing can ever come of such criticism, where the "poverty of the ascertained historical materials" is turned into endless imaginary wealth by "the uncontrolled power of combination and divination" (Pfeiderer). The focus, the burning point of investigation, must then be this *Personality*, which is thus the irresolvable residuum of the most inexorable analysis. But we may be absolutely sure that nothing can ever come of the arbitrary methods in vogue, all of whose airy constructions of the "Naza-

Are but dust that rises up
And is lightly laid again.

Against every such theory of a unique deified Man, still more against the recent crudities of Kalthoff (Jesus merely a social-ethical Ideal!), while expressly holding important collateral questions in abeyance, it seems that criticism must now *explicitly* postulate the aboriginal Godhood of the Centre of Christianity, as appears at least from these considerations:

1. *The more human Personality, which each critic postulates according to his own convenience, makes no great figure in the early propaganda.* Neither in the book of Acts, nor in the Epistles, nor in the oldest extra-canonic literature, can the keenest eye detect the after-effect of "the Carpenter," his words, his deeds, his life, his death; the Jesus, the Christ is everywhere conspicuous, towering like the Matterhorn, but everywhere supremely as an object of worship, as an over-earthly supernal Being, as a God ("The Outlook," 66, p. 686 f., 1900). The greatest early preacher, The Apostle, apparently cared little or naught for the earthly history of Jesus, and preached Him solely as a Divinity. When Harnack and the rest talk of "the impression that he made upon his disciples and which they propagated," they forget the Pauline injunction not to be wise above what is written. Certainly, any such human Person as they assume must have made and left a regulative, overpowering, and ineffaceable impression; the fact then that no such impression at all is anywhere discernible, but quite the contrary, must teach us to revise their assumptions.

2. *The preaching of "the Jesus" was seemingly pre-Christian.* We have already mentioned the occurrence of the name and the idea in "an ancient psalm of the Naassenes" (Harnack), which we have no right to regard as post-Christian. It also occurs repeatedly, at least four times, in the 'Zauberpapyri' lately brought to light, especially at line 3120 of the great Paris Papyrus edited by C. Wessely, in a long "Hebraic Logos" which shows no trace of Christian influence, which is expressly attributed to "the pure men," and which the great master, Dieterich, positively ascribes to the (pre-Christian) *Essenes*. At line 3119-20 we read *Ἰησοῦς ὁ θεὸς καὶ τὸ θεὸν τὸν ὁμοῦν* "I adjure thee by the God of the Hebrews, Jesus."

As the end of controversy on this point we cite Acts xviii. 25, where of the learned and eloquent and zealous Apollos of Alexandria it is said, "He was wont to speak and teach accurately the doctrine of the Jesus (*ὁ θεὸς καὶ ὁμοῦν* *καὶ τὸν ὁμοῦν*), knowing only the baptism of John." The phrase italicized excludes

¹ Most characteristically Bousset adds: "Then resulted through a creative miracle the new formation of the Gospel."

all possibility of biographical reference to the Jesus of the Gospels, and shows incontestably that the cult of the Jesus was fervently propagated far and wide in ignorance of the earthly Life of Jesus.

3. The Epithet "Nazorean" (*Nazōraios*, *Nazōraios*, *Nazōraios*) is not derived from Nazareth, a seeming topographic fancy, but is a divine appellative derived from the Old-Semitic stem *Naṣār*, meaning to *keep, guard, preserve*, frequent in the cuneiform inscriptions (*na-ṣa-ru*) as far back as 2250 B.C., constant in the Old Testament, where *Nôgrim* means *watchers*, precisely the term by which the Talmud designated the Christians (*Naṣōreans*). The epithet Nazorean would mean then *Servator*, almost the same as *Salvator* (Jesus), which are both used to render the Greek *Sōtēr*. The Syriac form *Nazāryā* suggests, but does not prove decisively, that the termination refers to the divine name *Yah*. So that *Nazāryā* would mean *Servator—Yah*. (See 'The Monist,' January 1905, pp. 25-45.)

4. The "Nazaraioi" were certainly "before Christ" and "knew not Christ," to quote Epiphanius (Pan. Haer. xxix. 6). The name is the same as *Nazāryā* (Syriac for Nazarene) and indicates that they worshipped God (*Yah*) under a particular aspect or *Person*, namely, as Protector, Preserver (*N—S—R*). The notions of *Servator* (*Nazār*—*ṣ*) and *Salvator* (*ṣōtēr*, *ṣ*) being hardly distinguishable, we naturally get the double title Jesus Nazorean. The fusion of this notion of *Saviour* with the more orthodox notion of *Messiah* (*Chrestos*)¹ gave rise to the slogan of Paulinism, *the Jesus—the Christ*; this fusion was perhaps distinctively the work of Paul.

5. Primitive Christianity seems not unifocal but multifocal in origin and development. It does not emerge full-fledged at Jerusalem and encompass the Mediterranean with the flight of an eagle. The "astoundingly swift" (Hemrici) spread of the Gospel seems only apparent. In reality it seems everywhere in the air, a divine contagion. It springs up almost simultaneously in Jerusalem, in Antioch, in Damascus, in Alexandria, in Rome, in Crete, in Libya, in Ephesus, in Corinth²—wherever in the Dispersion the seed was sown. The book of Acts makes two attempts to explain this multifocal fact in accord with its own unifocal theory. It assembles at Pentecost "in Jerusalem, dwellers, Jews, devout men from every nation that is under heaven," who, "each one in his own dialect, heard them (the Apostles) speaking." The other is found in the mighty persecution that arose against the Church in Jerusalem after Stephanos was crowned with martyrdom. "All were dispersed except the Apostles." But these were really the only or at least the principal offenders, the very ones that would have been dispersed first of all. Immediately after, the Church had peace, was builded up and multiplied (Acts ix. 31), and, not many years after, the believers in Jerusalem number many myriads, all zealous for the law (Acts xxi. 20). The fact of multi-

plicity is clearly implied in these abortive attempts to trace it back to a higher unity: The other evidences are strewn through the book of Acts, they are scattered and broken lights, but gathered up and focused by the lens of criticism they glow with surprising brightness.

So far the investigation has been carefully made, and so much appears "very probable." Still other kindred inquiries are in progress, but of these the results must be awaited. Enough, however, seems established to show that the "hopeless confusion" of Rationalism, in its century-old essay to interpret Christianity from the *Mos* Christ Jesus as the assumed sole human personal animating centre, must remain forever confused and hopeless, for no such interpretation can ever be correct. On the contrary, this most interesting and most important of all historic phenomena is comprehensible and must be comprehended as a total product of the totality of historic-religious-philosophic-ethic conditions prevailing around the Mediterranean, as a phenomenon which itself came not with observation, so that no man could say "Lo here!" or "Lo there!" but which emerged to view from the fermentation of three centuries and lightened like the dawn of a polar day round the whole horizon from the East even unto the West. This prodigy, this heir of all the ages, appeared at first under many forms, with many slogans and battle-cries, of very varying degrees of worth. It was the work especially of the second century to rally the straggling and sometimes contending arrays under one banner, to select and unify and communicate what was best in each, and to reject and excommunicate what was bad or irreconcilable. The organic result was the Old Catholic Church,—as its name implies, the *totalisation* of a host of originally more or less independent elements. Here, however, we are brought to the borderland of theology, and here we must pause, for that border we dare not cross. Many important consequences seem to present themselves naturally, but these must be left for the reader to recognize. If the deep-eddying streams of criticism, whose swift descent we have followed through the century, has now at last surmounted and surpassed every bulwark of tradition, we need only reflect that it is a cleansing and a fertilizing flood, the river of the waters of life, that has been poured abroad over exhausted fields, and that the inundated plains will blossom and brighten anew with abundant blessing.

WILLIAM BENJAMIN SMITH,
Tulane University, New Orleans.

New Testament Criticism. Triple Evidence.—Logicians distinguish between metaphysical, physical, and moral evidence for the things we know. Metaphysical evidence is based on the unchangeable essences of objects or on the analysis of our concepts; for example, the whole is greater than its parts. Physical evidence is based on the conditional stability of the laws of nature; for example, the sun rises in the east and sets in the west. Moral evidence is based on the testimony of a witness; it implies that we have the genuine words of the witness, and that the witness is endowed with the necessary knowledge and veracity. The New Testament does not furnish us either metaphysical or physical evidence; we have to be content with moral evidence. And even this is not of the highest order. We do not listen to the words of eye-witnesses, but we have only a number of historical and doctrinal writings to consult. Again, we do not possess a single autograph of these writings: our New Testament text has been copied and copied again, edited and edited again, so that at present not a single verse reads exactly alike in all copies and editions. The very words of our witnesses seem to have become uncertain. Moreover, doubt has been raised as to the knowledge and the veracity of our New Testament writers; their evidence has been pronounced unreliable even in those

passages in which their words are practically certain.

Criticism.—For these reasons the principles of criticism must be applied to the books of the New Testament. Lower or textual criticism will inquire into the genuineness of each verse and of every word of the New Testament. Higher criticism will investigate the authenticity of the entire New Testament books, and will test their reliability. Meanwhile, let not the metaphysician and the scientist underrate the evidence furnished by the New Testament writings. It is the evidence on which history is built; even the abstract thinker is content with this kind of evidence as soon as he leaves the region of speculation and enters into practical life.

Lower or Textual Criticism.—Lower or textual criticism strives to restore the original text of the New Testament. Its method consists generally in a reversal of the process by which false readings have penetrated into the text. The original readings are suggested partly by the ingenuity of the critic, partly by the text of early manuscripts or of patristic quotations or again of early versions.

Original Manuscripts.—The original copies of our New Testament books must have been lost very early. No early Father appeals to the original manuscript in defence of his own peculiar reading of the text. Tertullian (*de præscript.* 36) and Peter of Alexandria (*de pasch.* vii.; Migne, P. G. xviii. 517, 520) are no exceptions. Tertullian's words concerning the Pauline Epistles do not necessarily imply the existence of the original copies; and Peter's testimony is based on late authority. Neither can it be said that a fragment of Mark's original Gospel is still kept in Venice (Baron., *Annal.* ad ann. 485), and that the copy of Matthew's Gospel written by Barnabas is still extant in Constantinople (Assem., *Biblioth. orient.* ii. pp. 81 ff.); for both relics are spurious.

Early Variations.—Some of the early ecclesiastical writers are of opinion that the New Testament text was corrupted intentionally by the heretics. This view is expressed by Irenæus (*c. hær.* i. 27; Migne, P. G. vii. 638), Dionysius of Corinth (*Eus.* H. E. iv. 23; Migne, P. G. xx. 388 ff.), Tertullian (*c. Marc.* v., *passim*), Eusebius (*H. E.* v. 28; Migne, P. G. xx. 516), and Epiphanius (*hæc.* xlii. 9 ff.; Migne, P. G. xli. 708). We do not deny that heretical writers may have introduced one or another variant, but they cannot be held responsible for the great bulk of different readings. Nor are we at a loss to account for the early appearance of variations. (1) Oral tradition was prized higher in the earliest times of the Church than the written word. (2) The dogma of inspiration was not sufficiently well developed to demand a special amount of accuracy on the part of the copyists. (3) Most copyists did not work as official scribes of the Church, but transcribed the text for the use of private persons. (4) It must also be kept in mind that the scientific accuracy of later days was not a characteristic feature of the first centuries. (5) Finally, the copyists were fallible men, and as such they were not exempt from the various sources of accidental error to which all scribes are subject.

Earliest Witnesses for Variations.—Among the earliest witnesses for the existence of va-

variants in the New Testament text must be reckoned Polycarp, Hegesippus, Papias, the Elders of Irenæus, Justin, Theodotus, the Churches of Vienne and of Lyons, Marcion, Ptolemæus, Heracleon, and Tatian. Nor can the variants, for the existence of which they testify, be regarded as mere accidental slips of memory. Polycarp's quotation of Act. ii. 24 (ad Philipp. 1, 2) disagrees with nearly all Greek codices and early versions, but it agrees with cod. D, the Vulgate, and several other versions. The double reading of this passage must then have existed even in his days. Irenæus (adv. hæres. 30. 1; Migne, P. G. vii. 1203) appeals to ancient and accurate manuscripts in defence of a certain reading. Clement of Alexandria, too (Strom. iv. 6; Migne, P. G. vii. 1252), cites variants of certain passages. Various readings must therefore have been quite common in the 2d century. In the 3d century Origen complains of the great diversity in the codices (in Matt. xv. 14; Migne, P. G. xiii. 1293), and during the course of the 3d century Jerome attests that the evil grew rather than diminished (ad Dam. præf. in evang.). After the 4th century the occurrence of variants is attested by existing manuscripts, patristic quotations, and faithful translations.

Incipient Stability.—It has been believed that Origen was the author of a revised text of the New Testament. But this opinion can hardly be reconciled with Origen's own words (in Matt. xv. 14; Migne, P. G. xiii. 1293). On the other hand, many learned men did not consider it below their dignity to aid in the transcription of the sacred text. Eusebius and Jerome (H. E. VI. xxxii. 3; de vir. ill. 75) testify that Pamphilus had transcribed certain texts. Jerome again (ep. 34; al. 147) tells us that the priests Acacius and Euzois had been engaged in transcribing the sacred text in the library of Caesarea. In other passages Jerome shows his esteem for the manuscripts written by Adamantius and Pierius (in Matt. xxiv. 26; in Gal. iii. 1; Migne, P. L. xxvi. 181, 348), the latter of whom was one of Origen's successors in the presidency of the Alexandrian School; but neither Jerome nor Eusebius can be cited as a witness for a text revision by either of Jerome's favorites (cf. Eus. H. E. vii. 32; Migne, P. G. xx. 732). True text revisions appear to have been edited by the Egyptian bishop Hesychius and the Antiochian priest Lucian. It is true that Jerome's words (ad Dam. præf. in evang.; de vir. ill. 77) are not as clear and definite as one might desire. Still they show that Hesychius and Lucian had paid considerable attention to the problem of the New Testament text. Hug, Eichhorn, and W. Bousset have ventured to suggest that the work of Hesychius has been preserved in the so-called Alexandrian group of New Testament variants, while that of Lucian is variously connected with the Byzantine or the Neutral group. But no proof for either view has thus far been advanced. It cannot be denied, however, that from the 4th or 5th century onward the variants in the New Testament crystallize into several types or forms, differing according to the country in which the respective manuscripts were written, the versions were made, and the citations were employed.

Causes Which Effected the Stable Text Groups.—We have said that the different

groups of variants were more or less attached to their place of origin. But loyalty to the customs of particular places was not the only cause of the incipient text stability. The following considerations will suggest additional reasons: (1) The local ecclesiastical authorities naturally insisted on having the transcriber copy the text current in each particular Church. (2) After the Church began to enjoy the blessings of peace under the reign of Constantine, the bishops had better opportunities to regulate the interior affairs of their respective dioceses (cf. Soroz., H. E. i. 11; Migne, P. G. lxvii. 889). (3) Owing to Diocletian's decree concerning the destruction of sacred books, many copies of the New Testament had been destroyed during the late persecution, so that the number of the model texts was greatly reduced (Eus., H. E. viii. 2; Migne, P. G. xx. 745). (4) Finally, the Emperor Constantine charged Eusebius with the transcription of 50 new codices which were donated to the various imperial foundations and thus became the model text for innumerable other copies (cf. Eus., Vit. Constant., iv. 34, 36, 37; Migne, P. G. xx. 1181 ff.). Here we have an explanation of the fact that the so-called Syrian or Byzantine group of texts attained such an overwhelming popularity.

The Written Text from the 4th to the 16th Century.—Though from the 4th century onward the particular Churches had their own peculiar groups of variants which they propagated in preference to other readings, it must not be imagined that the lines of demarcation between these text-families are mathematically accurate. Suppose we denote by 1 the text peculiar to the Church A, by 2 that current in the Church B, by 3 that peculiar to the Church C, etc., then the text peculiar to the Church Z will not be entirely new, but in all likelihood it will be a mixture of 1, 2, 3; and the text of the Church Y will be a mixture expressed by 3, 2, 1; and similarly the text of the Church X will be the mixture of 2, 1, 3. And while the codices were thus propagated, fairly faithful reproductions of parts of the text were kept for us by Eusebius, Athanasius, Epiphanius, the two Cyrils, Basil, the two Gregories, Chrysostom, Theodoret, and Ephrem. To these illustrious men must be added Andrew of Cappadocia for the 5th century, Venerable Bede, John Damascene, and Alcuin for the 8th, Photius for the 9th, Suidas and Arethas for the 10th, Theophylactus, Oecumenius, and Euthemius for the 11th and 12th, the Correctoria for the 13th, and Laurentius Valla for the 15th. And this is by no means an exhaustive list of men and works important for textual or lower criticism.

New Testament Codices.—Greek manuscripts are divided into uncials and cursives or minuscules. In uncial writing all the letters are large and divided. The other class of manuscripts is called minuscule, because its letters are small; it is called cursive, because its letters are linked together in a running hand. Broadly speaking, the manuscripts written before the 10th century are uncial; those written between the 10th and the invention of printing (1454 A.D.) are minuscule or cursive. Not counting 8 manuscript psalters containing the text of the hymns found in the third Gospel, the New Testament uncials number 114; 2 of these belong to the 4th century, 13 to the 5th,

NEW TESTAMENT CRITICISM

24 to the 6th, 17 to the 7th, 19 to the 8th, 31 to the 9th, 6 to the 10th. But only one of all these contains the complete text of the New Testament; 4 others contain the greatest part of it. Besides these 5, there are 81 gospel manuscripts (12 complete or nearly so, 14 partial ones, and 55 fragmentary), 13 of the Book of Acts (5 complete or nearly so, 8 more or less fragmentary), 5 of the Catholic Epistles (4 more or less complete, 1 fragment), 20 of the Pauline Epistles (7 more or less complete, 13 fragmentary). There are 4 complete manuscripts of the Apocalypse, and 1 defective one. Of the cursive manuscripts more than 1,200 contain the Gospels, more than 400 the Book of Acts, more than 500 the Pauline Epistles, more than 180 the Apocalypse. Besides, textual criticism knows more than 260 lectionaries with fragments of the Book of Acts and of the Epistles, and more than 950 evangelistaria, about 100 of which are uncial manuscripts. The investigation into the origin and the relationship of the various cursive manuscripts is far from being complete. To facilitate reference, the uncial manuscripts were denoted by capital letters, either Latin or Greek or even Hebrew, while the cursives were indicated by Arabic figures. H. Fr. von Soden has changed this notation considerably. On the list arranged according to this improved plan, not merely the identity of Soden's 2,328 manuscripts is indicated, but also their age and contents ('Die Schriften des Neuen Testaments in ihrer ältesten erreichbaren Textgestalt hergestellt auf Grund ihrer Textgeschichte'; Bd. I.).

The Printed Text.—It was in 1516 that Erasmus published the first printed edition of the Greek New Testament text. He based his work on six manuscripts at most; of these none was complete, and only one valuable. New and improved editions of the Erasmus text were issued in 1519, 1522, 1527, and 1535. Meanwhile, the polyglot edition of Cardinal Ximenes, which had been prepared with much greater care, and had left the press on 10 Jan. 1514, was published in 1522 (perhaps in 1520); but being limited to 600 copies, it never reached a large circulation. Not to mention other reissues of these two main editions, Robert Estienne or Stephanus repeated in his third and fourth editions (1550, 1551) almost the pure Erasmus text, adding in the margin variants based on 15 manuscripts and the polyglot of Ximenes. The English *Authorized Version* and the so-called *Received Text* current in England follow the third edition of Stephanus. His fourth edition is the first Greek text divided up into verses. Among its numerous re-editors, Th. Beza and the Elzevir Brothers deserve the first rank. The preface of the second Elzevir edition, which appeared in 1633, contains the words "*textum habes nunc ab omnibus receptum*." Hence the reprint of this text, and there are more than 170, are simply called the *Received Text*. In brief then, the *Received Text* is the text of the second Elzevir edition, which appears to be a repetition of the Bezan text. This latter is the fourth edition of Stephanus corrected according to several notes of Henry Stephanus, some ancient versions, and the Codex Claramontanus. In its turn, the Stephanus edition is a repetition of the fifth Erasmus edition, and the latter is based on codd. 1 and 2 for the text of the Gospels,

on cod. 4 for the text of Acts, on cod. 7 for the Pauline Epistles, on cod. 1 for the text of the Apocalypse, in such a way, however, that the successive reprints of this highly composite text were slightly emended according to a few other text sources.

Critical Apparatus.—Robert Estienne (c. 1546) and Th. Beza (c. 1565) are rightly considered as the pioneer collectors of an apparatus for the textual criticism of the New Testament. Br. Walton (c. 1657) and John Fell also co-operated at the building up of such an apparatus, but they were far surpassed by Mill (c. 1707), who collected about 30,000 variants out of more than 100 sources. Bengel (1687-1752) first divided the various readings into groups. He distinguished between an African and an Asiatic or Byzantine type of variants. Semler (c. 1740) and Griesbach (1745-1812) distinguished three text groups: the former called his divisions the Alexandrian, the Occidental, and the Oriental or Byzantine family; the latter named his groups the Alexandrian, the Occidental, and the Constantinopolitan. Eichhorn (c. 1820) and Hug (c. 1840) agreed with Griesbach, but Scholz (c. 1850) returned to the double division into Alexandrian and Byzantine readings. Tischendorf (1815-74) acknowledged four different types of text, an Alexandrian, a Latin, an Asiatic, and a Byzantine; Tregelles (1813-75) favored again a dual division of texts, naming them the Constantinopolitan and the Alexandrian group. Finally, Westcott and Hort introduced four text families: the Syrian, the Occidental, the Alexandrian, and the Neutral. The Syrian text is the vulgate text in the Greek Church since the middle of the 4th century. It is supposed to be a revised edition of a pre-Syrian vulgate text. This latter exhibits three peculiarities: one group of its variants is remarkable for paraphrases, interpolations, amplifications, and omissions; this text constitutes the Occidental group. Another group of variants is peculiar for its grammatical and scholastic emendations, and this is called the Alexandrian. A third set of variants, though pre-Syrian, shows neither the diffusiveness of the Occidental text, nor the nicety of the Alexandrian; it is therefore called the Neutral group. Now, since the Syrian text figures as the vulgate of the Greek Church after the middle of the 4th century, and since about a century must be allowed for the rise and passing away of the Occidental and the Alexandrian families, the Neutral type of variants must have been the common text during the course of the 2d century. But it cannot be maintained that these premises and conclusions are admitted by all textual critics.

Critical Editions of the New Testament.—After the *Received Text* had become the current Greek text, it began to be regarded as quite sacred. Mill, Bengel, and Wetstein collected various readings differing from the *Received Text*, but they did not dare to introduce them into the body of the New Testament. It was Griesbach who first changed the *Received Text* according to the authority of various manuscripts; but not even Griesbach had the full courage of his conviction. Besides, he was not acquainted with some of the oldest manuscripts discovered after his time (c. 1777). We need not delay over some of the less important edi-

NEW TESTAMENT CRITICISM

tions published by Mace, Harwood, Matthæi, Alter, Scholz, Schott, Knapp, Tittmann, Hahn, Theile, and others.

Lachmann (1793-1851) was the first who endeavored to construct a new text out of the oldest manuscripts known to him. Believing it impossible to restore the original text, he tried to reconstruct the readings that had been current in the Church during the course of the 4th century. For this purpose he confined his study to a few of the oldest manuscripts, together with a few of the Fathers, and the best codices of the Latin Vulgate. He simply counted the authorities in favor of each reading, and then followed the majority. Though the text thus prepared is far better than the *Received Text*, it is based on too small a number of witnesses, on too slight a knowledge of the few manuscripts actually used, and on too mechanical a method of using them.

Tischendorf's services in the publication of manuscripts have probably done more to establish textual criticism on a sound basis than anything else. Besides, he published at least 8 (according to another method of reckoning, 21) editions of the New Testament. It is to be regretted that he did not use his material more consistently and scientifically. Between 1841 and 1849 he differs considerably from the *Received Text*; between 1849 and 1869 he approaches quite closely to it; but after 1869 he again diverges from it. His last, or eighth edition (1864-72) still remains the standard collection of evidence for the Greek text. The prolegomena (1884-94) to this edition are the work of Gregory; they give an account of the manuscripts, the versions, and the patristic quotations.

Tregelles (1831-75) published two manuscripts, and collated many others with great accuracy, thus preparing his material for a revised Greek text. He based his edition exclusively on the most ancient authorities, but he used a larger number of them than Lachmann had done. Like his predecessors, he did not follow the principle of grouping in his new edition, so that the choice of his readings depends somewhat on personal preferences. Alford, Lightfoot, Weiss, and others also have devoted a good deal of study to the New Testament text, but more with a view to its proper interpretation than its emendation.

Finally, Westcott and Hort have given us a new edition of the New Testament text based on the principle of grouping as explained under the preceding number. By adhering to the Neutral readings, they believe they reproduce the text current in the Church during the course of the 2d century. This edition has met with determined opposition, especially on the part of Scrivener and Burgon. These two scholars maintain that in the reconstruction of the Greek text all available authorities must be considered, and the most ancient must not be given the sole right of being heard. J. B. McClellan, too, based his English version of the Gospels (1875) on a revision of the Greek text, in which internal probability is taken as the most trustworthy guide in the selection between variants. Other good editions of the Greek text have been published by Weymouth, Gebhardt, Nestle, Brandeis, and Hetzenauer.

Recent Discoveries.—In recent years quite

a number of discoveries have been made which have an important bearing on the textual criticism of the New Testament. The Arabic text of Tatian's 'Diatessaron' has come to light, and was edited by Ciasca in 1888. The so-called second Epistle of Clement was discovered by Bryennios in 1875. In the last named manuscript was also contained the Teaching of the Apostles, but it was not made known till 1883. A fragment of the Gospel of Peter was discovered in 1886 by members of the French Archaeological Mission, who conducted excavations in the cemetery of Akhmim, in upper Egypt. The Sinaitic Syriac manuscript was discovered by Mrs. Lewis and Mrs. Gibson in 1892, during their visit to the Monastery of Saint Catharine, on Mount Sinai. Part of the Codex Purpureus was brought to light in 1896 in the neighborhood of Caesarea. Finally, some Sayings of our Lord were discovered by Messrs. Grenfell and Hunt in 1896 and 1903 on the site of the ancient Oxyrhynchus, in Egypt.

Results.—Confining ourselves to general statements, we may derive the following conclusions from what has been said: (1) The material for the textual criticism of the New Testament is constantly growing. (2) In Mill's time the number of variants in the New Testament was estimated at 30,000; in 1874 Scrivener counted at least 120,000; Schaaf stated in 1892 that they did not fall much short of 150,000. (3) There are more variants than words in the New Testament; in fact, there are about 20 variants to each single verse, and they increase with each new discovery. (4) Lower criticism shows that we need not be alarmed at the number of these variants, and that the substance of the New Testament is absolutely certain. (5) Dr. Hort, who is surely good authority in this question, tells us that "the amount of what can in any sense be called substantial variation . . . can hardly form more than a thousandth part of the entire text." (6) Ktulen enumerates only four passages in which the variants touch matters of faith: Mk. i. 1; Act. xx. 28; 1 Cor. xv. 51; and 1 Tim. iii. 16. But our faith is not affected by these variants; the revealed truth contained in these four passages is sufficiently certain from other texts of the New Testament. (7) Our classical scholars are satisfied that we possess the true text of those classical works of antiquity that have come down to us, though our knowledge of these works depends on a mere handful of manuscripts, while the manuscripts of the New Testament are counted by hundreds and even thousands. (8) The fact that our New Testament variants differ only in form, not in substance, excludes the hypothesis that it is the result of syncretism. The very defenders of this hypothesis seem to feel the difficulty; hence they declare that the New Testament presents "a syncretism without parallel in literature, unless in the Old Testament." (9) The number of manuscripts, of ancient versions, and of patristic quotations, is so great that it is practically certain that the original text of the New Testament is preserved in some one or another of these ancient authorities. This cannot be said of any other book of antiquity.

Higher Criticism.—The name Higher Criticism (q.v.) implies that it deals with problems more important than those of the textual or

lower criticism. These problems are the questions concerning the integrity, the authenticity, the literary form, and the trustworthiness of the various books. In the case of profane writings, these topics have been considered by a science called Literary Criticism. The higher critic ought to employ in his work not only the evidence of the literary work itself, but also external evidence that may be at his command. The internal evidence comprises the style of the book, the views of its author, allusions to past or contemporary events, geographical and chronological data, religious, moral, and political principles, grammatical forms, lexicographical peculiarities; in fact, all the details that offer a solid basis for comparing the work under consideration with other literary products of the same period of time or by the same author. After all these elements have been considered, the actual work of comparison can safely be undertaken.

Faults of Higher Criticism.—We do not say that all higher critics are sophists, nor do we imply that sophistry occurs more frequently in higher criticism than in any other branch of human science; we wish only to point out some faults that higher critics have actually committed in their process of reasoning. (1) Many higher critics begin their work with a prejudiced or biased mind. While the orthodox inquirer cares very little whether he has to admit a supernatural fact more or less, and is therefore free to follow objective evidence, the unbeliever is pledged *a priori* not to admit any supernatural fact, seeing that a single fact of this kind would upset all his theories. If Christianity, they say, originated from Jesus, then he must have been superhuman. But nothing superhuman must be admitted at any cost. Hence Christianity must be considered as the syncretism of its age, the last efflorescence of the Judæo-Greco-Roman Spirit. And all this vague terminology blinds them to the fact that this hypothesis involves a greater miracle than they have sought to avoid. (2) The higher critics often infer a *passé ad eas*; they imagine that a certain fact can be explained according to a given hypothesis, and forthwith that hypothesis is upheld as the only explanation. History and common sense may go against their inference, but all this cannot make them change their point of view; *et sic pro ratione voluntas*. (3) The higher critics often change the degree of certainty of their contentions as they go along. First, something may be true; next, it is *probably* true; again, it is *certainly* true; finally, they actually refer back to their preceding statement with the words, "we have *proved* this to be so." (4) The argument of silence, too, has been highly favored by certain higher critics, though no regard was paid to the conditions under which alone this argument is of any value. (5) Again, higher critics are apt to pronounce judgment on topics outside their sphere of study. They claim to give an opinion on matters theological, philosophical, historical, scientific without the least hesitation; they even feel aggrieved if their criticism is criticised.

First Beginning of Higher Criticism.—The same higher criticism is of comparatively recent origin, but its principles are very old. In the last century before Christ, Dionysius of Halicarnassus won great renown by his crit-

ical acumen. In the early days of the Church, too, the books of Scripture were defended against the attacks of a Porphyry and a Celsus by men like Clement of Alexandria, Origen, Eusebius, and Jerome by an appeal to the principles that are employed by our present-day higher critics. It is true that during the course of the succeeding ages our great Christian scholars were imbued with too great a reverence for the inspired books to subject them to the critical process applied in the case of profane literature. Still, there were notable exceptions even to this rule. The introductory treatises to the Bible as a whole or to its several books were applications of critical principles. Richard Simon (1638-1712) applied the same in a pre-eminently masterful way in his famous work, 'Histoires Critiques du Vieux Testament, du Texte et des Versions du Nouveau Testament.' The erudite works of Dom Calmet, too, give evidence of skilled critical inquiry.

The Age of Scoffers.—Though railery is no longer the equivalent of argument, it is instructive to review the attempts made to undermine the authority of the Scriptures by means of this weapon. Among the scoffers Voltaire holds a pre-eminent place. The tradition that he copied his difficulties against the credibility of the Bible out of Dom Calmet's works without either adding their solution or indicating his sources, is too well known to need repetition. In his wake followed the French encyclopedists. A panegyrist calls Voltaire the king who succeeded Louis XIV., and who handed the royal sceptre over to Napoleon. Among his ministers figure such celebrated men as Diderot, D'Alembert, Buffon, Helvétius, D'Holbach, D'Argens, Lamettrie, Turgot, Condorcet, and in a way also Rousseau and Montesquieu. The king himself had learned his trade among the Deists of England, whither he was forced to withdraw in 1726, and where he remained for about two years. Chubb, Toland, Tindal, Woolston, Collins, Bolingbroke, Chubb, Whiston, Shaftesbury, Whitley, Somers, Wharton, Shrewsbury, and Buckingham figure among the principal apostles of English Deism.

Rationalism.—In Germany three forces had been at work to prepare the minds of the people for disbelief in the New Testament: First, the Wolfian philosophy had freed the mind from the strict letter of the Bible; secondly, the New Testament editions of Wetstein and Griesbach had shaken the readers' confidence in the inspired text; thirdly, Bengel and Crusius had modified the current notion of inspiration, insisting more on the active part of the inspired instruments than on their passive condition. The public was thus ready to appreciate Lessing's publication of the 'Fragments of Woltffenbittel,' the work of his deceased friend Samuel Reimarus (d. 1768). The first part of this work published in 1774 inculcated tolerance for the Deists; the second part appearing in 1777 was a general attack on revelation; the third part published in 1778 was directed against Jesus and his apostles, practically representing them as so many deceivers.

But this attack on the reliability of the New Testament was too brutal to become popular. Hence Paulus (1761-1851) proposed a hypothesis which removed the supernatural element

from the New Testament as effectively as Reimarus had done, and at the same time saved the veracity of the inspired writers. In his 'Leben Jesu' (1828) he distinguishes two kinds of supernatural elements in the Gospels; one kind is carried into the Gospels by the interpreters against the intention of the inspired writers; another kind is really intended by the sacred text. The former is removed by a proper method of interpreting the Bible; the latter must be regarded as the result of the subjective impression of the evangelists. They were rude, uncultured fishermen, and judged of the extraordinary phenomena in the life of their Master in a way that was neither scientific nor rational. In brief, according to Paulus, the writers of the New Testament are no longer deceivers, but they were incompetents.

The reliability of the New Testament fared still worse in the 'Leben Jesu' published (1835, 1864, 1874) by Strauss (1808-71). He apparently saves both the veracity and the competency of the sacred writers, but he declares their work to be a mere collection of myths. The storm raised in Germany by this work is too well known to need further description.

Strauss had studied only the contents of the Gospels without paying due attention to the Gospels themselves. Ferdinand Christian Baur (1809-82) perceived this weak point in the work of his pupil, and endeavored to strengthen it. He believed that he had discovered the key to the history of early Christianity in the romance of the so-called Clementine Homilies. The opposition between Peter and Paul and their respective parties he traced back from these homilies into the books of the New Testament, in which the opposition between Petrinism and Paulinism was said to be either reflected or harmonized or again considered as past. Only the Apocalypse of John, the Epistles to the Galatians, to the Romans, and to the Corinthians were admitted as genuine; all the rest of the New Testament was pronounced pseudonymous, and relegated into the 2d century. Here we have the tenets of the Tübingen school.

Anti-Tübingen Movement—Baur made several vital mistakes in his assumptions: (1) His fundamental thesis concerning the great opposition between Paul and the other apostles cannot be proved (cf. Weber, 'Katholik,' 1898, pp. 193 ff.; 1899, pp. 45 ff.). (2) Baur's preference for the four great Pauline Epistles was merely personal; subsequent negative criticism has not spared their genuineness (cf. Bruno Bauer, 'Kritik der paul. Briefe,' 1850-2; Steck, 'Der Galaterbrief nach seiner Echtheit untersucht,' 1888; Pierson, 'De Bergrede,' 1878). (3) Baur was wrong in his utter neglect of early Christian tradition. The testimony of a Clement of Rome, an Ignatius, a Justin, a Marcion, an Irenaeus, and a Tertullian should not be set aside at the bidding of merely subjective considerations. Hilgenfeld, in his 'Historisch-kritische Einleitung in das Neue Testament' (1875), acknowledged the genuineness of several New Testament books rejected by Baur; Reuss, in his 'Geschichte der heil. Schriften d. N. T.' (1842), restores the origin of the whole New Testament, excepting 1 Pet., to the 1st century. Similar conclusions were reached by Ewald, B. Weiss, Hofmann, Schulze, Godet, Zahn, Harnack, and other writers. On the

whole, our most recent critics admit that early Christian tradition ought to be respected, and though the defenders of the general genuineness of the New Testament books encounter still strenuous opposition, as has been seen on the occasion of the publication of Zahn's 'Einleitung,' they are no longer charged with lack of scientific method.

Syncretism.—There are critics who maintain that the striving to understand Jesus as the originating source of Christianity must prove abortive. They believe that "the most enlightened scholarship of Europe and America has no standing before the bar of logic." The genesis of Christianity, we are told, "must be sought in the collective consciousness of the first Christian and immediately pre-Christian centuries; in the amalgamation of faiths when all the currents of philosophic and theosophic thought dashed together their waters in the vast basin of the Roman circummediterranean empire." But how can organic unity develop out of heterogeneity? How can concord develop out of discord and opposition? The material elements which compose the plant or the brute beast exist before either plant or beast begin to live; but who will imagine that a horse or a cow will be the result of the dashing together of their respective material elements? Moreover, Monsignor Batiffol ('Revue biblique,' January 1903) has shown that between 120 and 140 A.D. Marcion wrote a treatise proving that an opposition exists between the Law and the Gospel; at that early period therefore the Gospel was considered as possessing paramount authority. Again, Marcion appealed to Saint Paul in proof for the absolute newness and independence of Christianity. At Marcion's time therefore there existed a Canon of the New Testament books. And why should the faithful have esteemed the Gospels and the Pauline Epistles higher than the Epistles of an Ignatius, unless they were convinced that these canonical writings contained the exact teaching of the Master? The authority of Christ's word had preceded the authority of the canonical books.

What is Christ?—Higher critics distinguish between the Christ of history and the Christ of Christianity. Harnack, Wrede, and Staerk may be said to simply rob Christianity of its Christ. Schmiedel, O. Holtzmann, Bousset, and Schürer endeavor to link the Christ of history together with the Christ of Christianity, but their explanations are unsatisfactory. The Abbé Loisy, too, distinguishes a triple Christ: first, the views of Christ concerning himself; secondly, the faith of the early Christian community concerning Christ; thirdly, the Christology of the New Testament. And if you ask on what the faith of Christianity is based, if not on the facts of history, there will be as many different answers as there are writers. So that we rightly urge against our present-day higher critics the dilemma: Christ is either God, or what is He?

Bibliography.—A fairly complete list of the elder literature belonging to this subject may be found in Reuss, 'History of the New Testament' (Vol. II, p. 367 f.); O. von Gebhardt adds to the preceding a fairly complete list of the pertinent literature down to about 1866 in his 'Ort und Übersetzungen der Bibel,' which is a reprint of his articles on 'Bibel-

NEW TESTAMENT THEOLOGY

text und Bibelübersetzungen,' contributed to the 'Realencyclopædie,' pp. 16, 54 ff. Woodstock College.

New Testament Theology, that branch of theological science which has for its peculiar task to state, arrange and compare the theological doctrines and conceptions found in the New Testament. While it might be combined with Old Testament theology under the name Biblical theology, yet the differences in dates, language, style and contents between the Old Testament and the New are such that their respective theologies have usually been treated separately, although their methods are necessarily identical. It is also possible to state the doctrinal teachings and theological conceptions of any individual author, and even those found in any single work of any author, and such contributions to Biblical theology have often proved exceedingly valuable; but the historic unity of the New Testament renders it practically important that the teachings and views of the various New Testament authors should be so presented and compared as to give but a single impression of the whole.

Character and Relations.—New Testament theology is strictly a historical science, neither attacking nor defending the conceptions which it finds, but merely stating, arranging and comparing them. As a historical science it is connected with Ecclesiastical History, and might be considered the first volume of the History of Christian Doctrine. But it demands such a mastery of the results of the sciences of Isaagogy and Exegesis on which it depends, that it is usually associated rather with interpretation, of which it might be reckoned the crown. It also presupposes and builds upon Old Testament history and the history of the world in New Testament times, and in its turn it provides much material for Dogmatics.

History.—The name Biblical Theology, which had earlier been employed to designate such a system of dogmatics as was based upon the Scriptures rather than upon either creeds or reason, was first used in its modern sense by Gabler in 1787, since which time the science in its application both to the Old Testament and the New has gradually developed. The first American work in the sphere of New Testament theology was published in 1870, and the first lectures in any American theological school are said to have been given in 1883. Since then it has received a steadily increasing amount of attention.

Difficulties.—The task of the New Testament theologian presents peculiar difficulties. It is impossible for him to increase the amount of the material with which he deals, however helpful for supplementing or verifying his conclusions such increase might be. All expression of thought is defective, and most of all is this true in theology, where upon words derived from the earthly and the human is laid the burden of declaring the heavenly and the divine. Further, the teachings to be considered come in a form due to ancient ages, tongues, and conditions, and accordingly accurately and adequately to restate in modern form thoughts which have thus come down in ancient garb cannot be easy. Then, since with few exceptions the theological thoughts contained in the New Testament found expression solely for ends then immediately practical, it follows that the statements are often partial and incomplete, and the emphasis upon certain aspects of truth is only relative, and these statements must be read with constant reference to the thought of the age and the details of the local situation to which they belong. Hence only with difficulty can the incomplete expressions of practical religious thought be fitted together to reconstitute such systems of doctrine as may be credibly attributed to the various New Testament authors.

Grouping of the Books.—There is general agreement as to the grouping of the New Testament books according to the types of thought which they exemplify. The teaching of Jesus demands attention first, if not as a standard for the rest or as of superior authoritative, as at any rate prior in time to the other New Testament teachings and as presupposed by them. The records of Christ's teaching are necessarily subdivided into the Synoptic and Johannine reports. The second group of documents represents the type of Christian thought which developed among Christians of Hebrew descent, and consists of the first part of the book of Acts, the letters of James and Jude, the two letters of Peter (which, however, show that there had been a development considerably beyond the primitive conceptions current in the church), and such traces of apostolic or other early doctrine as may be noted in the Gospels. In the Pauline section the Epistles attributed to this Apostle fall naturally into four groups, which differ in theme and matter as well as in date and style. If any of these letters should not be held to be Pauline in origin, they are yet so distinctly in harmony with Paul's views that this would not change their place in the general classification, while the Epistle to the Hebrews is a natural pendant to the writings of Paul. The fourth

group of New Testament writings consists of the books attributed to the Apostle John, consisting of his letters, of so much of the Fourth Gospel as is not the teaching of Christ and of the Revelation.

Kingdom of Heaven.—In the Synoptic reports Jesus began his teaching by echoing the proclamation of his forerunner, John the Baptist: "The kingdom of heaven is at hand." While from the beginning of this preaching he seems to have recognized that he himself was to be the head of the promised kingdom, yet his own conception of the character and work of the Messiah was so different from the popular conception, so much loftier and purer, that he could not present himself at once and unreservedly as the Coming King, for, had he immediately and unmistakably advanced his claim, political enthusiasm would have forestalled religious faith, and even on the part of true followers earthly ideals, expectations and plans would have obscured and neutralized heavenly, as, indeed, to some extent actually occurred in spite of caution and reserve. The name kingdom of heaven or of God, however, remained prominent throughout the teaching of Jesus, but in the latter part of it with an altered meaning. Convinced that he had nothing to hope from the leaders of the nation or the people whom they controlled for the kingdom of prophecy, which was intended to reach its spiritual ends through a local, national, political organization, Jesus necessarily substituted individual submission to the sovereignty of God, and retaining the name without the form, the kingdom which he strove to establish became in his teaching universal and spiritual.

Repentance and Faith.—While the state of individuals and society which he would establish thus took a new form in consequence of his rejection by his nation, the conditions of entrance, as well as the ultimate ends to be attained, remain unchanged. The first demand upon each and all is for repentance. As a morally transformed and thus fit nation should have met its King come at last, so only a soul turned from evil to good can receive the spiritual blessings which Jesus bestows. More and more clearly as antagonism gave renewed opportunity, Jesus denounced sin and demanded from all without exception penitence and reformation, although in serene consciousness of sinlessness he ever held himself apart from all confession of any evil on his own part.

The Supreme Place of Christ.—With repentance as a reversal of moral tendency must come acceptance of himself as Supreme Master and absolute submission to him. His demand for self-denial is a demand for complete self-abjuration; his invitation, "Come unto Me," is not only an invitation, but no less the presentation of himself to the world as the one fountain of spiritual blessing; to receive him he says is to receive God himself, and personal service to him is regarded as proof of sins forgiven; devotion beyond all other loves is required, and so absolutely supreme is the relation of the soul to him that on confession or denial of him he makes the issues of the future life to hinge. This relation is made still more significant by the few but clear and emphatic teachings as to his death, by virtue of which as a ransom salvation would be rendered possible for men.

God's Love.—The fourth element in the

teaching of Jesus which the Synoptists record relates to God. This teaching is almost never metaphysical, only religious and practical. The chief thought in it is God's love. This love, which exceeds that of any earthly father for his child, is shown in the rising of the sun on the evil and the good alike and the coming of the rain on both just and unjust, and in care for sparrows, ravens and lilies, and finds its crown of perfectness in kindness to the unworthy. The climax of this teaching appears in the parables about rescue of the lost, in the third of which, usually called the "Parable of the Prodigal Son," this tender love of God is so winningly presented that it has given a very common name for the love of God, so that all Christ's teaching is said by many to be dominated by the thought of God's "Fatherhood," a view which should be so held as to include the other conceptions of Jesus as to God's special relation of fatherhood to believers, and his unique fatherhood to Christ himself.

Johannine Teaching of Jesus.—In the Gospel of John the teaching of Jesus is presented with a superficial dissimilarity at first sight striking, but in essential consistency with the Synoptic reports. As the place of the ministry reported is largely the city of Jerusalem instead of the open country of Galilee, as we have often hostile Pharisees for interlocutors instead of disciples for reverent auditors, so of the four chief elements of the Synoptic teaching, the Kingdom, Repentance and Faith, his own unique supremacy and the fatherly Love of God, the kingdom is scarcely mentioned, repentance is ignored and faith given a different aspect, and the paternal kindness of God is much less emphasized, while Jesus insists even more upon his own pre-eminence and shows it in new lights.

Deity of Christ.—The two foci of the teaching reported in the Fourth Gospel are, as might be expected from the author's own statement of his purpose as stated at the end of his writing, the deity of Christ and the duty of Faith. All the discourses in the Gospel are selected with a view to showing Christ's self-revelation to the world on the one hand and to his disciples on the other. While his Messiahship is not here emphasized, there is presented instead a conception of a sonship based on a unique unity with God, combined with hints of pre-existence, suggestions and implications of divinity and, finally, a welcome by Jesus to the assertion of his deity.

Faith.—The proper relation on the part of his disciples, and, indeed, of all men, toward this personality who thus presents himself is not mere acceptance of statements about him and of truths relating to him, but further spiritual union with him by entering into relations to him, appropriation, in a word.

Judaic Teaching.—The earliest Apostolic teaching and the type of doctrine which seems long to have prevailed among the churches which were of Judaic origin and cast, was only to a very slight degree dogmatic, and brought no enlarged or corrected doctrines touching the nature of God or the character of men. Indeed, no New Testament authors ever approach these themes as if intending to communicate fresh truth, but rather to confirm and apply truth already commonly apprehended. The chief thought of the primitive church was the place and rank of Jesus, and here even the earliest teaching of the Apostles is developed in many

aspects beyond that of Jesus himself, a fact which is not surprising when it is remembered on the one hand that we cannot rightfully suppose that he exhausted the contents of his consciousness in even his frankest disclosures to his disciples, and on the other hand he himself promised that the guidance of the Spirit whom he would send from God would result in larger knowledge than his own instructions had brought. While the name of the kingdom is dropped at once and permanently out of use, at the same time the Messiahship of Jesus is asserted, and it is insisted upon that by his coming forth from the tomb re-embodied, which was the resurrection to which his Apostles testified, his Messiahship and Lordship were fully confirmed. While it was constantly recognized that Jesus was no less man than other men, he was regarded as distinguished from other men, not only by his character of unique holiness, but also by his Messianic rank which gave him universal sovereignty and Lordship, and, further, he was given the title Lord, which had been a familiar substitute for the most sacred of all the divine names. Theological discussions as to the nature, basis and conditions of salvation are not to be expected in such documents as represent Judaic Christianity, but it is plain that it was thought of as release alike from the consequences and the power of sin, provided, especially in the former aspect, by the death of Christ, and to be obtained by repentance.

Pauline Teaching.—The teachings of Paul are much fuller than those of the other Apostles, and in many places, owing to the doctrinal controversies which evoked them, they approach somewhat closely to dogmatic form, while such was the diversity of the occasions out of which the letters arose and of the situations of their first readers, that they cover nearly the whole field of Christian thought. Paul's conceptions of the nature and attributes of God, of his sovereignty and his love, and of the ruined condition of sinful men, while frequently brought out with great distinctness, were in no sense peculiar to himself. His special topics are, besides the rank of Christ, his saving work, the duty of man in relation to it, and the activity of the Holy Spirit in completing it. While Paul unhesitatingly assumes a general knowledge of the life and teachings of Jesus, he looked to Christ as far transcending in nature and rank what might be inferred from these facts. In Paul's mind the unique fact of the resurrection of Jesus at once certified to his unique nature and relation to God and opened to him the way to supreme exaltation and universal dominion which would become fully his when he should return in glory to earth. He shared the divine essence; in his activities before his birth of a woman he created the universe and continues to uphold it, and to him worship is rightfully paid. The life and especially the death of Jesus were a part of the divine plan for the rescue of men from the state into which their sin had brought them. The death of Christ was clearly set forth by Paul as provided in the love of God as a basis indispensably prerequisite for the favorable treatment which he gives to every penitent; the blood of Christ was to Paul the ransom and propitiation by virtue of which redemption and reconciliation are secured for men. Paul was led by controversy to insist with peculiar urgency that Divine forgiveness and favor are

conditioned on faith alone, that is, that salvation does not primarily depend on the behavior of a man, but on his acceptance of God's gracious gift, but while faith alone is the condition of entrance on the Christian's state, yet the Christian life in its ideal involves nothing less than the perfect performance of every duty, and this ideal is practically attained only by the aid and power of the Holy Spirit, whom he regards as possessing personal, divine attributes, who is imparted to every believer and permanently dwells in him.

Teaching of the Epistle to the Hebrews.—The letter to the Hebrews makes no contribution of special novelty to the theology of the New Testament. While somewhat unlike the thought of Paul in that it presents the Mosaic system as helpfully preparatory to Christianity which supersedes it, the views which it presents of the transcendent rank and sacrificial death of Christ are in fullest harmony with Paul's. That Christ is a "high priest," that is, a representative of men before God, and that faith is an unyielding grasp on the invisible, are thoughts which are peculiar to the author of this Epistle.

Johannine Teaching.—The teachings of John relate themselves proportionally more to God himself than those of any other New Testament teacher, but his conceptions of the deity, like theirs, are mainly dynamic and ethical, rather than metaphysical. His thought seems to sum itself up in three words, life, light and love, which suggest that God is the constant source of all power and joy; that he is spotlessly holy and tends unceasingly to manifest himself as such in and to his universe, and that his most central, essential and characteristic attribute is kindness and beneficence, unceasing and all-embracing. In the teaching of John the eternal Logos, or expression of God, became incarnate in Jesus, and thus presents God to men; and in turn by his death he became the "propitiation" in virtue of which forgiveness is promised on condition of penitence and confession. The privilege and duty of Christians is fellowship with God, that is, by refraining from all sin to share his spotless holiness.

New Theology, or New Divinity. The.
See EDWARDS, JONATHAN; PRESBYTERIANISM;
NEW ENGLAND THEOLOGY.

New-Thought is an idealistic or metaphysical movement in this country. It began about 20 years ago. It is a direct successor of New England transcendentalism, but is much more practical and democratic. The older idealisms were seclusive, but this one is preached and practised on the highroads and carried into the minutiae of daily life, often assuming the forms of religion and philosophy. It boasts of being the greatest healer the world has yet seen

NEW-THOUGHT

and scorns the idea of being mere speculation. It is claimed that New-Thought will not create any new religion or creed and that it will not formulate any new system of metaphysics. As regards religions, it is said by the representatives of New-Thought, that they are not desirable, because they are based on will, not on thought, and because they demand obedience. As regards metaphysics, no system is wanted, because life and thought cannot be confined in a system. The world needs illumination and freedom, not limitation.

The first apostles of New-Thought were P. P. Quimby of Portland, Maine, Dr. W. F. Evans, and their immediate disciples. The first preached it orally, the other by the pen. None of these, however, are its parents in any sense, nor are they quoted as authorities by any present-day followers or teachers. New-Thought is the modern expression of an inherent self-affirmation of the soul as old as the soul itself. New-Thought self-affirmation is intensely individualistic and has found its philosophy in Emerson's "Self-reliance." In the Emersonian extreme and in Tennyson's

Self-reverence, self-knowledge, self-control,
These three alone lead life to sovereign power,
— *Idem*.

may be found its First Principles. New-Thought people, however, identify the self with the "Oversoul" and commonly prefer to quote the Biblical "I am (that I am)" as their motto and foundation. The revealed secrets of the "I am" are to be read upon every page of their hundred and one serial publications. These "revelations" resound with mystic refrains of the Oriental *lat tuam an*, "That (namely the 'Universal Self') art Thou!" and they run into the high notes of Promethean self-dedication and rebellion. "The Song of the Soul Victorious" is of freedom, of our being centres; of concentration and self-assertion, human divinity, ideal suggestion, the souls' prerogative to rule and of "vibrations" which are the redemptive forces of existence. In strong contrast and as a jarring note in this solemn and highflowing song one reads immediately afterward that the publisher does healing, "absent treatment, a specialty," at so much or so much per contract, if the reader promptly forwards the money.

New-Thought ontology teaches "oneness of life," that "all life is one," but the student searches in vain for any scholastic definition of these axiomatic teachings as also for the theological dogma "God is omniscient, omnipotent and omnipresent." This last, the omnipresence of God, is taught to the exclusion of all other attributes. The bearing of these two doctrines leave, however, no doubt about their being inherently pantheistic in character, and implying a pantheism in the direction of the Hegelian pan-logism. To New-Thought life, God and all other categorical terms are swallowed up by Mind or "the limitless self." New-Thought epistemology is in harmony therewith: "all knowledge is one," it declares with much force, but without argument, the popular understanding being that human knowledge is one with divine knowledge.

New-Thought is often confounded with Christian Science, but their difference can clearly be seen by their cosmology. The latter holds the Oriental doctrine that the world and its

things are illusory, products of "the mortal mind," but New-Thought asserts the reality of the world and considers it an expression of God, the two being related as cause and effect. The central doctrines of New-Thought lie in psychology. They consist in asserting the supremacy of mind over all other energies and in identifying it with the perennial stream of energy which permeates existence at large. Our mind is identical with the supreme mind, it makes us what we are and creates our conditions and environment; by inherent love it overcomes all hatred, malice and sickness; by inherent law it establishes itself as the world's law and by inherent order it rules everywhere. It keeps itself alive in love, law, and order by constant affirmation of itself: "I am, that I am!" In ethics, the New-Thought is of a decided optimistic tendency. Its programme is the Emersonian "don't bark against the bad, but chant the beauties of the good." Evil is not real, but only an imperfection which illumination dissolves. New-Thought is not iconoclastic, but fulfils the ends of creation in "peace and good will." If others do not know Reality and only worship "an unknown God," New-Thought people do not think it right to use violence or even persuasion; growth and experience will bring truth.

New-Thought is intensely practical. It professes to heal sickness and to remove the sting of death. Sickness is error and is cured by right and wholesome thinking, and death is but a transition, a "passing out" into another condition. If we always stood fast in right thinking we should never die, but simply transform ourselves.

New-Thought "circles of healing" are very common. They are found in every State in the Union, and in most cities followers of the cult can be found. It is estimated they exist by the million. The cult and its teachings have spread to Canada, England, and many places on the continent, especially France and Germany. The circles are not churches, but "bethels" or "houses of thought" for instruction and meditations. Services on Sunday usually begin with the singing of "Omnipresence, Omnipresence, Omnipresence, manifest Thyself in me!" and are followed by a few minutes of meditation for the concentration of mind, before the discourse is given. Speakers are chosen without regard to creed or race, etc. Their main qualification lies in their experience of oneness with the Great All. At the circles rooms are set apart for daily noon-hour meditation. In the rooms are also private classes for instruction, etc. The circles are maintained by voluntary contributions, but no teachers, excepting private class teachers, are paid.

New-Thought healers are many, but New-Thought teachers are many more. Experience has shown that no man or woman can heal for more than a very limited period of their lives. When they can heal no more, they teach others the method. The methods of healing run through the whole scale of impressing the "new" thought by suggestion, hypnotism, faith, or simple rationality. Healing is done also by "absent treatment" or telepathy.

A New-Thought convention was held in Chicago, 17-20 Nov. 1903, attended by many thousands. The following "progressive" declaration of principles was adopted:

NEW ULM—NEW YEAR'S

1. The New-Thought is the new interpretation of universal and eternal Truth.

2. God—Universal Spirit, Mind, Principle—is omnipresent, omniscient, and omnipotent.

3. Man is the individual expression of God, possessing inherently and capable of manifesting all the aspects of God.

4. Man unfolds to a continuously expanding consciousness and manifestation of these aspects, through right thinking and right living.

5. The consciousness of harmony is Heaven, here and now; in the realization of which abide peace of mind and health of body.

6. The essentials of the New-Thought are suggested by the words—Unity, Co-operation, Freedom, Brotherhood, and Individuality

C. H. A. BJERREGAARD,

Librarian New York Public Library.

New Ulm, Minn., city, county-seat of Brown County; on the Minnesota River, and on the Minneapolis & St. L. and the Chicago & N. W. R.R.'s; about 80 miles in direct line west by south of Saint Paul, and 25 miles west by north of Mankato. It was settled in 1857 by a German Land Company, incorporated in 1870, and chartered as a city in 1876. It was the scene of an Indian massacre in 1862. It is in a productive agricultural region in which there is considerable attention given to stock-raising. Its chief industrial establishments are flour mills, breweries, cigar factories, a creamery, a cooperage, machine-shops, a pottery, brick and lumber yards, and grain elevators. The mills have about 175 employees; the cigar factories, about 70; the breweries, 75; and the brick yards, 50. It has an extensive trade in farm products and live-stock. There are five churches, and the educational institutions are public and parish schools, Dr. Martin Luther College, Saint Michael's Academy, a public school library, and the Turnverein Library. The three banks have a combined capital of \$170,000, and the annual business is about \$15,000,000. The government, under a revised charter of 1891, is vested in a mayor, who holds office two years, and a council. The electric-light plant and the waterworks are owned and operated by the city. The majority of the inhabitants are German or of German descent. Pop. (1910) 5,648.

PHILIP LIESCH,
Editor 'Journal.'

New Westminster, Canada, city in the Province of British Columbia, situated on the north bank of the Fraser River about 16 miles from its mouth in the Gulf of Georgia; on the line of the Canadian Pacific Railway, and the Great Northern Railway of which it is the northern terminus; 12 miles from Vancouver, and 75 miles from Victoria on the Island of Vancouver. It is connected with Vancouver by an electric railway. The climate is mild and pleasant. The Fraser River Bridge, connecting the city with United States lines by way of the Great Northern Railway and with the south bank of the Fraser and its farming, poultry-raising, fruit and vegetable interests, was opened in July, 1904. It cost \$1,000,000.

Industries and Business Interests.—The chief industries are lumbering, the salmon fisheries and their 44 canneries up the Fraser, oatmeal and woolen mills, machine and boiler

shops, foundry, furniture factory, fruit canning factory, cold storage works, carriage works, creameries, shingle mills, and car shops. The principal lines of shipment are fresh and canned salmon, lumber, rolled oats, grain, poultry and general supplies. Steamers run up the river about 50 miles several times a week, and daily down the river to Ladner and Steveston, and to Victoria three times a week. There is deep water all the way and large ships are loaded at the mills with lumber for all parts of the world. The exports of New Westminster in 1905 were \$2,753,713, the imports \$858,596, and the total customs revenue \$165,231.

Institutions, Buildings, etc.—The debt of the city is \$1,087,000, of which over one half was incurred in the construction of the waterworks system. This system supplies the city with water from a mountain lake (Coquitlam) 14 miles distant, by a steel main, and the water is equal to any in the world. The gross city assessment for 1905 was \$4,821,630, and the net taxable assessment was \$3,402,260. The rate of taxation was 25 mills. The city has 13 churches, 2 colleges, 4 public and 2 private schools, 1 high school, 2 hospitals, 1 provincial gaol, 1 penitentiary, 1 asylum for the insane, 3 banks. It owns the electric light and water systems and also contains the county buildings and the Supreme Court offices.

History, Population, etc.—The city was founded in 1859 by Colonel Moody, of the Royal Engineers, when the colony of British Columbia was established, and was selected as the first capital of the colony, with the early designation of Queenborough. In 1860 municipal government was established. In 1873 New Westminster was incorporated as a city. A serious drawback was the great fire in September 1898, which destroyed the whole business portion of the city, and a considerable portion of the residential section, with a loss of some \$3,000,000. The population is estimated (1906) at 8,000.

J. CASTELL HOPKINS,

Editor of 'The Canadian Annual Review of Public Affairs.'

New Year's. The observance of the first day of the year is of very ancient origin. The Romans on this day were accustomed to exchange greetings and make presents. New Year's under the Cæsars was a great source of profit to the emperor and quite burdensome to his subjects. The church at first prohibited Christians from having anything to do with it, but at last made the day a Christian festival. Before 1752 the year began on 25 March. The change in the calendar was made in that year for Great Britain by an act of parliament. In Persia the year is supposed to begin on 21 March, and the day is one of universal rejoicing. In Japan the new year is a season of much festivity and innocent mirth. Every portal is decorated, and each object of which the decoration is composed has a symbolic meaning. The usual form of the decoration is a green arch. Among the Chinese the day is the greatest festival of the year, and in France it is observed more than Christmas. A custom similar to that of making New Year's calls is the sending of cards to one's friends on the day. In this way one can keep up acquaintances

NEW YORK

that might otherwise die out merely from lack of time for great sociability. After the restoration of the Bourbons it became fashionable in Paris to send bonbons on New Year's day, and in 1822 a thousand tons of them were sold in the two days preceding the festival.

The day was more or less observed among the American Indian tribes. The Moqui celebration, called *So-yal-u-na*, is largely a presentation of a singular and elaborate mythic drama, divided into two parts, in which offerings are made to effigies of the great plume headed serpent, the enemy of the sun, followed by a sun dance, in which the conflict between the sun and the inferior hostile gods is admirably portrayed by Moqui men personifying the various deities.

In the United States it has always been the custom of the Presidents to receive on New Year's day. In 1790, when New York was the seat of government, Washington held a reception between the hours of 12 and 3 and was visited by all the home and foreign dignitaries. He expressed the hope on that occasion that whatever change might take place in the manners and customs of the city the observance of New Year's day might never be given up. In New York and other cities there are services in many churches and receptions in many clubs and drawing rooms. The formal custom of receiving New Year's calls has nearly become obsolete in our larger cities, it having been superseded by the regular afternoon and informal evening receptions, to which gentlemen take more kindly than to the old-fashioned New Year's party. The good old Knickerbocker custom is still maintained by some families. Some give formal dinners, and in the country, carriage loads not infrequently go round from house to house making merry calls, picking up additions to the party and finally ending with supper at some hospitable house and in an evening with games, refreshed by apples, roast chestnuts, plum cake and sweet cider. The day was not observed in Colonial times with the formality which has marked its observance in later years. After the Colonies had adjusted business affairs to the new date, the first of January grew in importance and in course of time became a legal holiday. See *CALENDAR*.

New York (the "Empire State"), a State in the northeastern part of the United States; lying between lat. $40^{\circ} 30'$ and $45^{\circ} 1'$ N and lon. $71^{\circ} 50'$ and $79^{\circ} 46'$ W.; bounded on the north by Lake Ontario, Saint Lawrence River, and Canada; on the east by Vermont, Massachusetts, and Connecticut; on the south by the Atlantic Ocean, New Jersey, and Pennsylvania; on the west by Pennsylvania, Lake Erie, and the Niagara River. Lake Ontario is west of the northern part of the State, and New Jersey is west of the southern part of the State. Lake Champlain is on the boundary between New York and Vermont. The extreme length of the State from north to south is 312 miles; and from east to west 326 miles, or 412 miles including Long Island. The area is 49,170 square miles, of which 1,550 square miles are water surface. The State contains 30,476,800 acres of land, of which 22,648,109 are in farms. It ranks in size the 26th among the States of the Union.

Topography.—About one half the boundary

of the State, exclusive of Long Island, is water. The chief inlet is New York Bay. Long Island, southeast of the mainland of the State, is separated from Connecticut by Long Island Sound; southeast of the mainland of the State, is separated from New Jersey by Staten Island Sound, Arthur Kill, and Newark Bay. Both these islands have inlets along the coast, some of which are good harbors. Along the shores of Lake Champlain and Lake Ontario there are a number of small inlets. In the Saint Lawrence River, where it leaves Lake Ontario, are numerous islands, many of them well wooded and beautiful. The group is called "The Thousand Islands." These islands are favorite summer resorts. Long Island on the south is a part of the coastal plain; the greater part low; the highest elevation is 382 feet. The eastern part of the State is mountainous, the ranges extending generally northeast and southwest. The central and western parts of the State are rolling or level land. The mountains belong to the Appalachian system. In the northeastern part of the State are the Adirondacks. Mount Marcy, the highest elevation in the State, 5,344 feet, is a peak of the Adirondacks. There are several peaks from 2,000 to 4,000 feet. These mountains are covered with forests, largely pine. The Adirondacks extend along Lake Champlain south to the valley of the Mohawk and west nearly to Lake Ontario. They are noted summer and health resorts; more people visit the Adirondacks annually for health or pleasure than any other outing place in the country. These mountains toward the south become ranges of hills which slope to the Mohawk in the east and to the lake shore plain on the west. South of the Mohawk Valley the land again rises to what is known as Catskill Mountains. Some of the peaks amid the Catskills are fully 3,000 feet high. Slide Mountain, the highest peak, is 4,205 feet above the sea. The Shawangunk Mountains, more a plateau, are south of the Catskills. The highest part of the plateau is in the west back from the Hudson from 1,000 to 2,000 feet. On the southeast and north is a limestone escarpment, Heideberg Mountain, which in some places attains a height of several hundred feet. In the western part of the State and parallel with Lake Ontario are two well defined terraces each about two hundred feet in height. The Lower Terrace, called Lake Ridge, extends from the Genesee River to the Niagara, and is from three to eight miles distant from Lake Ontario. This Lake Ridge marked at one time the southern shore of Lake Ontario, when the outlet of the lake was by way of the Mohawk Valley. The Upper Terrace, called Mountain Ridge, is about thirty miles inland, and extends east and west almost parallel with Lake Ridge. The highest part of the plain or plateau portion of the State is in Otsego County, where it attains the altitude of 2,300 feet. "Rock City," Allegany County, upon a summit 1,400 feet above the surrounding valleys, consists of a tract of 40 acres covered with rocks broken into layers forming streets and alleys.

Hydrography.—The waters of all the rivers of the State finally enter the Atlantic Ocean. They reach the ocean by way of the Saint Lawrence, Hudson, Susquehanna, Delaware, and Mississippi rivers. The great valleys of the State are the Hudson and Mohawk valleys,

which divide the State into three sections, one east of the Hudson and south of Lake Champlain, one in the northern part of the State, almost surrounded by water; Lake Champlain and the Hudson on the east, the Mohawk and Oswego rivers on the south and southwest, and Lake Ontario and the Saint Lawrence River on the west and north. The remaining section embraces the central and western parts of the State. The main stream lying wholly within the State is the Hudson River (q.v.), which with its tributaries, the largest being the Mohawk (q.v.), has been a great aid in the development of the commerce of the State. Through the Mohawk Valley the Erie Canal extends, and beyond to the Great Lakes, thus making a continuous waterway from the ocean north to the Mohawk and thence west across the State. The northern part of the State is drained by rivers which flow direct to the Saint Lawrence. The largest are the Black, Oswegatchie, Grasse, Racquette, Saint Regis, and Salmon. The Saranac enters the Saint Lawrence through Lake Champlain, and the Genesee and Oswego through Lake Ontario. The Susquehanna has its head waters in Otsego County, and the source of the Delaware is southeast of Otsego Lake. The Allegheny River, in the western part of the State, enters the Mississippi through the Ohio River. There are a number of falls and picturesque gorges in the Genesee River in the vicinity of the points where the stream breaks through the terraces. In the Adirondack region there are a number of beautiful lakes, the waters of which are remarkably clear. Lake George (q.v.), on the south slope of the mountains, is famous for its scenery and the points of historic interest surrounding it. Lake Champlain (q.v.), on the eastern boundary, together with Lake George, belong to the Saint Lawrence River basin. In the central part of the State are a number of lakes, long and narrow, which are called the Finger Lakes. The largest are Cayuga and Seneca, about 40 miles long, and from two to four miles wide. Oneida (q.v.) Lake is nearly circular in form. Lake Chautauqua, in the western part of the State, 1,212 feet above sea-level, is the highest navigable body of water east of the Rocky Mountains. The waters of this lake enter the Mississippi although it is only nine miles from Lake Erie. The most noted waterfalls and natural curiosities in the State are Niagara Falls, in Niagara River, 2,900 feet wide and 160 feet high; Portage Falls, in Genesee River, consisting of two falls, of 70 feet and 110 feet, and a series of rapids 150 feet; Genesee Falls, in Genesee River, at and below Rochester, consisting of three falls, of 96 feet, 25 feet and 84 feet, within a distance of two and a half miles; Trenton Falls, in West Canada Creek, Herkimer County, consisting of five cascades with a total fall of 200 feet in half a mile; Taughannock Falls, in Tompkins County, 230 feet; Chittenango Falls, in Chittenango Creek, Madison County, 136 feet; Lyons Falls, in Black River, Lewis County, flowing down an inclined plane 63 feet, at an angle of 60°; Kaaterskill Falls, Greene County, consisting of two falls, 175 feet and 85 feet; Baker's Falls, Washington County, consisting of a succession of falls and rapids, having a total descent of 76 feet in 60 rods; Cohoes Falls, in the Mohawk, near its mouth, with a total fall including rapids, of 103 feet; Glens Falls,

Warren County, 90 feet; High Falls, in the Hudson, Warren County, 60 feet; High Falls, Ulster County, 50 feet; the Ausable Falls, in Wilmington, Essex County, 100 feet; Enfield Falls, Tompkins County, consisting of a series of cascades with a total fall of 230 feet; Butter-milk Falls, Genesee County, 90 feet; and the falls in Fall Creek, Tompkins County, consisting of five falls with a total descent of over 500 feet in a mile. In East Canada Creek, about two and a half miles from its mouth, is a series of cascades and rapids having a total fall of 75 feet in 80 rods. Upon Stone Bridge Creek, Warren County, is a natural bridge 40 feet high, 80 rods broad, and 247 feet long. Dover Stone Church, Dutchess County, is a ravine 25 feet wide at the bottom, one to three feet wide at the top, about 40 feet long, and 40 to 50 feet high. Near Kysenike, Ulster County, is a cave which has been explored one and one half miles from its entrance. On Black River, at Lyons Falls, are the "Pictured Rocks"; and in Onondaga County are the "Crater Lakes" and "Green Lakes."

Geology.—Nearly all the geological formations are present in New York. The Archæan is represented in the Adirondacks and the Highlands of the Hudson, by gneisses, granites, ancient crystalline and metamorphic rocks. Potsdam sandstone of a kind which denotes existence in the Cambrian age, is on the northeast and west of the Archæan area of the north. The lower Cambrian rock shows in a narrow strip extending south from the head of Lake Champlain and in the vicinity of Lake George. The palæozoic constitutes four fifths of the State and is represented by schists, slates, metamorphosed rocks in the east and by massive and hard sandstones in the Catskills. The palæozoic is represented by the Cambrian, Silurian, and Devonian periods. The Adirondacks, Highlands and lands west were above sea-level in the Silurian period, but the area of the State west of this uplift remained submerged until the Devonian period. The Triassic and Jurassic are represented by Newark sandstones and shales, in Rockland County; and the Pleistocene, by glacial drift, and lacustrine and estuarine clays cover a great part of the State. The Pleistocene ice-sheet covered the entire State and accounts for many of the peculiarities of the topography.

Mineralogy.—The latest available report gives as the principal mineral productions for the year: salt, 9,076,743 barrels, valued at \$2,136,738; gypsum, 58,890 short tons, valued at \$929,038; petroleum, 1,320,909 barrels, valued at \$1,708,926; fibrous talc, 63,500 short tons, valued at \$499,500; metallic paint, 2,500 short tons, valued at \$26,900; mortar colors, 2,350 short tons, valued at \$25,050; Portland cement, 465,832 barrels, valued at \$582,290; rock cement, 3,409,085 barrels, valued at \$2,045,451; natural gas, valued at \$363,367; limestone, \$1,730,161; marble, \$332,518; slate, \$62,755; sandstone, \$1,467,496; granite, \$446,171; clay products, \$7,660,606; and iron, 441,485 long tons. Coal does not seem to exist in the State although found in large quantities not far south of the boundary. The Catskill and Potsdam sandstone, the Hudson River blue stone, and most of the limestone are valuable for building stone. The greatest deposits of hematite and magnetite are found in the

Adirondack region. Rock salt is found south of Lake Ontario in the vicinity of Warsaw. The mineral springs exceed in value any other State except Wisconsin. The principal mineral and medicinal springs are the salt springs of Onondaga County, from which over 7,000,000 bushels of salt are annually received; Saratoga Springs; New Lebanon and Stockport, Columbia County; Massena, Saint Lawrence County; Richfield, Otsego County; Avon, Livingston County; Clifton, Ontario County; Sharon, Schoharie County; Chittenango, Madison County; and Alabama, Genesee County.

Climate.—The climate of the State, as a whole, is continental; but that of Manhattan Island, Long Island, and Staten Island is modified by the ocean. The average maximum temperature for the State is 100°, and the minimum is a little below zero. The Adirondack region, north of the highest point, or on the northern slope, is the coldest, having the longest and most severe winters. The mean temperature for January is, in the Adirondacks, 15°; on the coast 30°; in the western part 26°. The mean temperature for July, in the Adirondacks, is 64°; on the coast 70°, and in the western part 72°. The rainfall is copious, averaging for the eastern part of the State about 50 inches and for the western part 40 inches. The State is remarkably free from malarial conditions. The Adirondack region is noted for its freedom from conditions inducing tuberculosis.

Flora.—See UNITED STATES.

Fauna.—See UNITED STATES.

Mining and Minerals.—The chief products mined in New York State are salt, iron ore, sandstone, limestone, fire-clay, marble, granite and slate. The salt output of Michigan exceeded that of New York until 1893, since which year New York has ranked first as a salt-producing State. The average annual value from 1898 to 1910 was \$2,000,000. The annual output of iron ore is about \$1,103,817; for the same year the natural gas brought \$363,367; the sandstone \$1,467,496; the limestone, \$1,730,162; rock cement, \$2,045,451; clay products, \$8,073,769; the granite averages nearly \$400,000, and the marble the same. Gold in small quantities has been found in the Adirondack region, and natural gas near Lake Erie.

Fisheries.—The oyster fisheries are the most productive, representing over half the total value of the fishing industries of the State. Next in value are the menhaden, bluefish, and clams. The most valuable fisheries are on the coast of Long Island; Suffolk County ranks first. The shad and alewives are found in the Hudson; trout in the Adirondack lakes. The canned fish amounts to about \$196,869. The number of persons engaged in the fisheries has diminished from 1880. The State department having charge of the "Forest, Fish, and Game," is pursuing a scientific system, looking to the preservation of the forests, fish, and game of the State.

Agriculture and Stock-raising.—The soil of two thirds of the State is suitable for agriculture, only the rocky mountain area and some sand-belts are considered as unproductive as not to be classed with agricultural lands. All the other conditions for productive farming exist in a favorable degree. Until 1890 New York State ranked first in the value of its agricultural products; in that year some of the Western States

reached first place and the farm products of each of three of them were greater that year than those of New York. As the wheat and corn output of the West has increased, the farm products and farm improvements of New York State have decreased. The average of improved land has decreased since 1880, and the nature of the crops raised has varied. The Western wheat and corn in competition has caused the decrease of wheat and corn crops and an increase in the hay acreage. Corn for forage is increasing. The annual hay forage acreage is about half the total crop acreage of the State. The acreage, production, and value of important farm crops in New York State in 1910 were as follows: Corn, acreage, 680,000 acres; yield per acre, 38.3 bushels; production, 26,044,000 bushels; total farm value, \$16,408,000. Winter wheat, acreage, 444,000 acres; yield per acre, 23.7 bushels; production, 10,523,000 bushels; total farm value, \$10,102,000. Oats, acreage, 1,338,000 acres; yield per acre, 34.5 bushels; production, 46,161,000 bushels; total farm value, \$19,388,000. Barley, acreage, 78,000 acres; yield per acre, 28.3 bushels; production, 2,207,000 bushels; total farm value, \$1,545,000. Rye, acreage, 170,000 acres; yield per acre, 18.3 bushels; production, 3,111,000 bushels; total farm value, \$2,302,000. Potatoes, acreage, 438,000 acres; yield per acre, 102 bushels; production, 44,676,000 bushels; total farm value, \$21,444,000. Hay, acreage, 4,811,000 acres; yield per acre, 1.32 tons, production, 6,351,000 tons; total farm value, \$87,009,000. The area under tobacco is 6,000 acres; the yield about 7,050,000 pounds. Beet sugar is produced. The farm animals in 1910 comprised 717,000 horses, 4,000 mules, 1,771,000 milch cows, and 889,000 other cattle, 1,117,000 sheep, and 656,000 swine. The wool clip in 1908 yielded 5,100,000 pounds of wool, valued at \$1,158,000. High in importance of farm products is potatoes. New York takes first rank in the acreage devoted to potatoes, and in the quality of the crop it is not surpassed. Market gardening is of considerable importance. Nearly all the farm lands of Long Island and in the counties near New York city, on both sides of the Hudson, are devoted to market gardening. In 1890 the average size of farms was 112.1 acres and in 1909, 102 acres. The farms occupied by tenants is 24 per cent of the total number. The dairy products of the State are of great importance and great value. The State ranks first in the value of butter and milk, and among the first in the value of cheese. The amount produced is sometimes greater in some of the other States, but the quality in New York is the best and always brings the highest prices. The soil, vegetable, and climatic conditions, and the introduction of scientific methods in dairy farming, have greatly improved the quality of the dairy products. The milk sold yearly brings \$40,000,000; butter, \$10,000,000. The dairy products bring about 31 per cent of the total income from the farms. Along the Hudson, especially in Ulster County, and in the Genesee Valley and west, there are large fruit orchards, apples predominating. In the lake region in the central part of the State grapes flourish. Hops and tobacco are cultivated in the central part, and hops flourish in Franklin County. Floriculture is increasing in counties near the city markets.

NEW YORK

LOWER SARANAC LAKE, ADIRONDACK MOUNTAINS.

Stock holdings were as follows for the years given:

	1910	1900
Dairy cows.....	1,308,670	1,301,608
Other cattle.....	813,081	1,004,781
Horses.....	300,130	621,430
Mules and asses.....	4,335	3,651
Sheep.....	980,527	984,516
Pigs.....	608,087	676,630

Forests and Lumbering.—The original forests of the Adirondack region were composed chiefly of white pine, hemlock, and spruce; near the base of the northern slope of these mountains there were large forests of maple, birch, elm, white pine, basswood, hemlock, and spruce. The hard and soft woods were also found in the southern and western parts of the State. At one time New York ranked first among the States in lumbering interests. The only forests still standing in which there is much lumbering are in the northern part of the State. Spruce and hemlock now form the principal output for lumber. The pulp wood mills and paper mills are now using large quantities of timber, mostly spruce. The State owns 1,163,414 acres of Adirondack lands (State Reservation), and there are about 705,914 acres in private parks, and about 1,356,816 acres owned by individuals and companies for their own purposes. During the last decade efforts have been made to preserve the forests of the State. See **FORESTRY**.

Manufactures.—New York ranks first among the States in the value of manufactured products. The Erie Canal was a great aid in developing many of the manufacturing industries of the State. It gave an opportunity to bring the raw material at small cost to places where there was water-power, and then, still at low cost, to send the finished products to the markets. The rivers with their extensive water-power have continued to hold the large share of the manufacturing even during the period when steam was the main power in many places, and now the water-power is of greater importance in the development of electrical power. The enormous power of Niagara Falls is causing a remarkable increase in the output of manufacturing, especially the aluminum, carborundum, and machinery made at the city of Niagara Falls. The great electrical plants of the State are increasing the manufacturing power; as at Schenectady, Mechanicville and other places on and near the Hudson River (q.v.); also at Massena (q.v.) near the Saint Lawrence River, and in many other parts of the State. The agricultural and mining interests of New York State are large and important, but her great manufacturing products are not only immense in amount, but of a wide and varied diversity. According to the 1910 United States census New York has held the foremost rank in manufacturing for many years, though, since 1849, when the first authoritative census of manufactures was taken, the proportion which the State has contributed to the total value of manufactured products in the entire United States has decreased somewhat. This proportion was 23.3 per cent in 1849 and only 16.3 per cent in 1909.

In 1849 the total value of the manufactured products of New York, including those of the neighborhood and hand industries, amounted to \$237,597,240, while in 1909, exclusive of the value of the products of the neighborhood and hand industries, it reached a total of \$3,369,490,-

192, or more than fourteen times that in 1849. During the same period the population of the State increased 104.2 per cent. In 1849 an average of 190,349 wage earners, representing 6.4 per cent of the total population were employed in manufactures, while in 1909 an average of 1,003,081 wage earners, or 17 per cent of the total population, were so engaged. During this period the gross value of products per capita of the total population of the State increased from \$77 to \$370.

In 1909 the State of New York had 44,935 manufacturing establishments, which gave employment to an average of 1,203,241 persons during the year and paid out \$743,263,000 in salaries and wages. Of the persons employed, 1,003,081 were wage earners. These establishments turned out products to the value of \$3,369,490,000, to produce materials costing \$1,856,904,000 were utilized. The value added by manufacture was thus \$1,512,586,000, which figure best represents the net wealth created by manufacturing operations during the year.

The following statistics of leading manufacturing industries (Census of 1910) will prove of interest. Clothing (men and women's)—Value of output for 1909, \$538,503,000; average number of wage earners, 189,467. The increase in the value of clothing manufactured in New York from 1904 to 1909 was \$177,636,000. Textiles—Value of output, \$185,780,000, average number of wage earners, 91,839. New York is the third State in the Union in the production of all textiles combined, of silk and silk goods, and of fur-felt hats, first in the manufacture of hosiery and knit goods and of carpets and rugs, other than rag, and second in that of cordage and twine and jute and linen goods. It ranks fifth in the production of woolen, worsted, and felt goods, and wool hats, and eleventh in that of cotton goods, including cotton small wares. Millinery and lace goods—Value of products, \$52,106,000. New York leads all other States in the Union in this industry. Fur goods—Value of products, \$41,301,000, constituting 73.8 per cent of the total of the United States in 1909. Printing and publishing—Value of products, \$216,946,000. New York leads all the States in this industry as a whole and in each of its branches. Foundry and machine shop products—Value of products, \$154,370,000, being the second State in the Union in this industry. Lumber and timber products (including logging operations, saw mills, planing mills and establishments manufacturing wooden boxes)—Value of products, \$72,530,000, giving New York second rank among the States in the lumber industry. Iron and steel works, rolling mills and blast furnaces—Value of products, \$66,153,000, average number of wage earners employed, 12,389. The State ranks fourth in this industry. Paper and wood pulp—Value of products, \$1,638,579. New York leads all other States in this industry. Boots and shoes—Value of products, \$48,186,000, giving the State third place among the States. Electrical machinery, etc.—Value of products, \$49,200,000. Tobacco manufactures—Value of products, \$76,662,000, leading all States. Slaughtering and meat packing—Value of products, \$127,130,000, ranking third in this industry. Butter, cheese and condensed milk—Value of products, \$42,438,000. New York is second in this industry, Wisconsin being first. Gas (illuminating

NEW YORK

and heating)—Value, \$42,347,000, the State holding first rank. Furnishing goods (men's)—Value of products, \$42,197,000. Patent medicines and compounds—New York leads all other States with a total output valued at \$37,343,000. Chemicals—Total value, \$35,346,000. Automobiles—Total value of products, \$30,980,000, more than seven times the amount reported for 1904. Precious metals—Value of products, \$30,825,000. Paint and varnish—Value of products, \$28,559,000, the largest of any of the States. Leather—New York occupies fifth place in this industry with products valued at \$27,642,000. Musical instruments—Total value of products, \$33,680,000, giving the State first place in this industry.

Industrial Importance of Cities.—The following table (U. S. Census) shows the average number of wage earners and the value of products in many cities and towns of the State:

CITY OR VILLAGE	Average number of wage earners, 1909	Value of products, 1909
New York City.....	534,002	\$2,029,692,576
<i>Boroughs:</i>		
Manhattan	385,358	1,388,408,005
Bronx	14,434	42,680,793
Brooklyn	123,883	417,322,770
Queens	23,891	151,680,180
Richmond	6,436	29,700,888
Buffalo	51,413	218,803,994
Rochester	39,108	112,676,215
Yonkers	14,711	59,333,865

Watervliet	753	1,668,579
Ossining	356	1,328,925
White Plains	249	815,789

Transportation and Commerce.—The principal railroad systems crossing the State are the New York Central & Hudson River, the West Shore (New York, Chicago & Saint Louis),

the Erie, the Lehigh Valley, the New York, Ontario & Western, the Delaware, Lackawanna & Western, the Pennsylvania, and the Delaware & Hudson. The great trunk lines of the country make connections with all these roads. In 1900 there were 8,095 miles of railroad in the State. In the year 1899 the railroads of the State had one fourth of all the passenger carrying trade and one fifth of all the freight traffic of the United States. The Mohawk and Hudson was the first railroad in the State; it was completed and ready for operation in 1831, extended from Albany to Schenectady and was 17 miles long. About 11 years afterwards there was a railroad completed from Albany to Buffalo; next came the Erie, and then the road from New York city to Albany. In 1825 the Erie Canal (q.v.) was opened, and it has been in use in the carrying trade since that time. Other canals of the State are the Oswego, the Champlain and several branches. At the general election, in November 1903, the people voted an appropriation of \$101,000,000 to enlarge the Erie Canal. The State board of railroad commissioners have general supervision of railroads, especially with reference to public safety and convenience and to any violations of the law governing the railroads of New York. The total construction and equipment of all railroads, steam, surface, and elevated, within the State, is as follows: 1850, \$63,255,847.83; 1860, \$137,848,323.59; 1870, \$308,890,198.76; 1880, \$716,101,467.28; 1890, \$1,385,560,174.65; 1900, \$1,732,960,017.48. New York ranks first in the Union in foreign commerce. Its exports and imports include every variety of raw or manufactured material that enters the United States. New York City ranks as the third shipping port of the world, coming after London and Liverpool. The imports for the fiscal year ending 1910 amounted to the value of \$935,990,958 and the exports to the value of \$651,986,356. The exports consist largely of grain, flour, cotton, tobacco, apples, and other fruits, preserved provisions, cattle, and frozen meat. Most of the great railroad lines which bring merchandise from the west have their terminals on the New Jersey side of the harbor, but there are ample facilities for the transfer of goods to the docks on the eastern side by means of lighters and of barges which carry the loaded cars across. In New York State there are 8,600 miles of railroad, and 4,000 miles of electric railroad track. The canals of the State, used for commercial purposes, have a length of 566 miles, of which the Erie canal has 387 miles. The commerce between the places in New York State and other points in the Union is much greater than the foreign trade of the State.

Banks.—In 1782 the first bank in the State was incorporated as the Capital Bank of North America. The second bank was chartered in 1791, as the Bank of New York. The privilege to establish a bank or the granting of a bank charter became a political favor after 1804, when the law was passed making it necessary to have the sanction of the Legislature to establish a bank or issue currency. In 1812 there were 20 banks in the State, and in 1829, 48 banks. The charters were for a specified term of years, and various means were resorted to to secure renewals. It was deemed necessary to change the laws for the establishment and government

NEW YORK

of banks, and in 1829-30 a change as effected. The "safety fund" method was established. A board of bank commissioners was created, examinations and annual reports were established. (See BANKS.) The system of clearing houses now deemed essential, began in New York city. In 1854, the first year of trial for the new system, the exchange amounted to \$5,500,000,000. The total exchanges in the year 1910 were \$102,553,959,100. The conditions which govern commerce and finance make the clearing house of New York practically, the clearing house of the United States.

The following statistics give valuable information regarding the growth of the banking system of the State:

per cent; excise tax, 17.5; and inheritance tax, 14 per cent. The first arrangement made for an income for State expenditures was the formation of a productive fund from the sale of public land. For a time the income derived from this general fund was sufficient for the support for the State government and the schools. In 1814 it was found necessary to increase the revenue, and this was done by forming another productive fund for school purposes. Later a direct tax was levied, but in 1826 this was discontinued. A system of public improvements was instituted in 1817, and a public debt of \$7,000,000 was incurred. The Erie Canal and other public improvements increased the debt. An effort was made to meet the new obligations by a

Finance.—The State income is derived mainly from a tax for general expenses and for schools, 20 per cent; corporation tax 25.5

sinking fund and by canal tolls and other means. The plan of loaning State credit to private corporations, principally railroads, was

begun in 1827. In 1842 the Erie Railroad failed with a large indebtedness to the State. Other smaller creditors failed also, and this new debt, together with that of the former, amounted to \$20,310,000. A tax was imposed sufficient to meet expenses, many public improvements were stopped, and outside debts were funded. The Constitution adopted in 1846 inserted clauses looking to a prevention of such conditions. No debt could be contracted except for war, and then popular sanction by a referendum was necessary. A general sinking fund and a canal sinking fund were created. The Constitution now in force retains the provision relative to popular sanction by a referendum. In the year 1895 the State debt was \$53,000,000. Of this amount \$30,000,000 was war bounty debt. In five years the debt was reduced to \$32,400,000; another decade saw it only \$8,988,000; and the whole debt was canceled in 1893. In 1900 a new debt was created for improvement of the Erie Canal. For the fiscal year 1910, the bonded debt was \$57,230,660. The income at present is derived from taxes on assessable property, fees from foreign corporations, licenses, taxes on certain public franchises, trusts, and banks. For the year 1910 the expenditures were \$57,422,390.96; and the revenues, \$59,872,316.73.

Insurance Statistics.—Following is a comparison of the business done in New York State by casualty, fidelity and surety, credit, real estate title and mortgage guarantee companies for the years ending January 1, 1909, and January 1, 1910:

Four general casualty insurance companies of other States were authorized by the department during the year ending 1 Jan. 1910, and the license of one was revoked.

Government.—The government of the State is administered in accordance with the provisions of the State Constitution. This Constitution may be amended by a majority vote of the House in two consecutive Legislatures and adopted by popular vote of the people. It may be revised by a Constitutional Convention, and the popular vote of the people. The last revision of the State Constitution was made in 1894, and went into effect 1 Jan. 1895. This Constitution provides for amendments and revisions as stated, and that the question of a Constitutional Convention and of a revision of the Constitution must be submitted to the general vote of the people every 20 years, or more frequently if so ordered by the Legislature. It provides also for a State census every 10 years.

All male citizens in New York State can vote, unless debarred by crimes against the law or of unsound mind. To be a citizen of New York State a man must have been a citizen 90 days, one year a resident of the State, four months a resident of the county, and 30 days a resident of the town or precinct. It is also required that voters to be entitled to vote must register, but registration for town and village elections cannot be made obligatory unless by express provision of law. In the cities the holding of party primaries are regulated by law; and the way in which votes shall be cast in all parts of the State is also regulated by law. The officers of the government are the executive, the members of the Legislature, the judiciary, and their subordinates.

Executive.—The governor of New York is elected biennially, by popular vote at a general election held throughout the State the first Tuesday after the first Monday in November. He appoints a superintendent of public works, a superintendent of banking, of insurance, of State prisons, a factory inspector, a commissioner of agriculture, commissioner of labor statistics, and an excise commissioner. He has a veto right which may be used to prevent appropriations or other legislative measures; but the Legislature may overrule the veto of the governor by a two-thirds vote of the members of the Senate and Assembly. He may pardon or relieve criminals, and he may commute a sentence. He has power to make appointments other than those mentioned subject to approval by the Senate. The officials elected with the governor and for the same number of years are the lieutenant-governor, secretary of state, comptroller, treasurer, attorney-general, and state engineer and surveyor. The most important State boards or commissions are for health, lunacy, and charities, for forestry, railroads, quarantine, and tax equalization.

Legislature.—The Legislature is composed of a Senate of 51 members, who hold office two years; and an Assembly of 150 members, who hold office one year. The State is divided into senatorial and assembly districts. The senatorial districts, being less in number, have each a much greater population than each of the assembly districts. The lieutenant-governor is president of the Senate. The members of the Assembly elect their own presiding officer, who is called the Speaker. The populous counties are divided into two or more assembly districts. The members of the Legislature receive a salary of \$1,500 and mileage for each session. The Legislature holds its sessions in the State Capitol at Albany.

Judiciary.—The court of appeals is the highest court in the State. It consists of the chief justice and six associate justices, each chosen by a popular vote and for a term of 14 years. There are 102 judges belonging to the supreme court, each one of whom is chosen by popular vote for 14 years. The State is divided into nine judicial districts. Other courts provided for by law are county courts, city courts, surrogate's courts, justice's courts.

Local Government.—The incorporation of villages, chartering cities, and organization of counties is within the jurisdiction of the Legislature. The Legislature decides the limit of taxation and assessment for incorporated villages and cities, and restricts their power of

borrowing money. Any special legislation for a city or the cities of the State shall be submitted to the cities concerned, for their approval or rejection; but the Legislature may later overrule the veto of the city. Cities are divided, according to population, into three classes. The first class includes cities having a population of 250,000 or more; the second class includes cities having a population of over 50,000 and less than 250,000; the third class includes all other cities in the State.

Militia.—The National Guard, a portion of the State militia, is armed, equipped and ready for service at all times. It numbers 15,575 in 1910 (officers and enlisted men). The Naval militia is also a part of the State militia and it also is ready for service at any time. It numbers 651 officers and enlisted men. There are four brigades of the National Guard. The headquarters are in Albany.

Political Divisions.—The State is divided into 61 counties. The county officers are judge, surrogate, sheriff, clerk, treasurer, district attorney, superintendent of the poor, and coroners. Each county, except New York, is divided into towns. The officers of the town are supervisor, clerk, commissioner of highways, assessors, constables. There are 42 cities (1910), the largest of which are: New York, pop. (1910) 4,766,883; Buffalo, 423,715; Rochester, 278,149; Syracuse, 137,249; Albany, 100,253; Troy, 76,813; Utica, 74,419; Schenectady, 72,826; Yonkers, 70,803. The government of the cities is vested in a mayor, board of aldermen, and the subordinate officials. Some cities are governed under a special charter. The villages are usually smaller than the cities, and the government is administered by a president and a board of village trustees. There are 43 congressional districts; the State sends 43 Representatives to Congress. There is a State Park or Reservation in the Adirondack Mountains, and one at Niagara Falls. There is a State Reservation for Indians on the Saint Lawrence River at the mouth of the Saint Regis and the Raquette rivers.

Religion.—All Christian denominations, and the Jews, have churches and large congregations throughout the State. Among Christian Churches, the Roman Catholic predominates in number of communicants and church attendance, in the cities, and Protestants in the smaller cities and country places. The Protestant denominations, according to number of communicants and attendance, rank as follows: Methodists, Presbyterians, Baptists, Protestant Episcopalians, Lutherans, and Congregationalists.

Education.—The system of education aims to furnish free schools for all the minors of the State, and in late years a system of education for adults has been organized and put into force with success. Education is compulsory between the ages of 7 and 16 years. The Annual Report of the Education Department (1911), gives the following statistics: *Attendance*—Common elementary schools, 1,301,924; special elementary schools, 1,121; common high schools, 115,373; special high schools, 4,551; academies, 42,072; normal schools, 6,609; teachers training classes and schools, 4,068; universities, colleges, and professional schools, 33,792; special higher institutions, 4,703; private schools (estimated), 295,000; Indian schools (estimated), 7,848; evening schools, 125,086; trade and vocational schools, 1,013; total, 1,866,160. The number of

teachers employed in these schools were 52,075; the net value of property, \$345,000,101; and the total expenditures were \$74,423,825.14. The salaries of teachers in public schools amounted to \$34,801,604, the average annual salary being \$820, and the total number employed was 41,990.

Training for teachers is given in the State normal and training schools, one State normal college, and a large number of training classes located in different villages and cities, according to the needs of the sections asking for the establishment of such schools. Teachers' institutes are provided by the State, and a regular teaching-institute staff is maintained. (See SCHOOLS, COUNTY TRAINING.) The system of granting certificates or of licensing teachers is by uniform examinations. The Examination Department makes out the questions, assigns the time (for State examinations, the place), examines all the papers of the candidates, and decides who shall or shall not receive certificates. Many of the cities have special rules regarding other examinations, and also the establishment and maintenance of city training schools and classes. The local supervisor in a city is the superintendent of schools, in an assembly district, the school commissioner. The country sections are divided into school districts.

Cornell University (q.v.) is the only institution of collegiate grade in the State which awards scholarships by examinations. Columbia University (q.v.), founded under the auspices of the Protestant Episcopal Church, is the oldest institution of the kind in the State. Other colleges and universities are: New York University, New York city; College of the City of New York, Union College at Schenectady; Hamilton College, Clinton; Hobart College, Geneva; Colgate University, Hamilton; Saint John's, Saint Francis Xavier, Manhattan, and De la Salle colleges, New York city; colleges and universities in Buffalo, Syracuse, Rochester, and Elmira; Vassar (q.v.) is at Poughkeepsie; Barnard is affiliated with Columbia. There are 17 theological seminaries, 12 medical schools, 4 schools of pharmacy, 3 dental schools, 7 law schools. The State requires a certain degree of education before beginning the study of a profession, in a State school, and an examination is given at the end of the course to determine fitness and ability for graduation. The New York State Library (q.v.) claims to be the first public library in the State; it was founded in 1790. (See LIBRARIES; REGENTS, for "Traveling Libraries" and "Home Study Clubs.")

Charitable Institutions.—The governor and the Senate appoint the State boards of charities, corrections, and lunacy. The duties of the Board of Charities are to exercise an advisory supervision over charitable institutions, State and local, and over private institutions to which public charges have been committed. The institutions thus supervised number over 500, and the number of inmates in these institutions is about 60,000. The office of fiscal supervisor of State charities was created by ch. 252, Laws of 1902. He is appointed by the governor subject to confirmation by the Senate, and has the general supervision over the accounts and expenditures of the charitable and correctional institutions of the State, which include reformatories, industrial schools, institutions for the mentally defective, institutions for soldiers, for the blind, orphans, crippled, deformed, and treat-

NEW YORK

ment of tuberculosis. State charity institution buildings are contracted for under the supervision or by the approval of the governor, president of the State board of charities and the State comptroller. Among the present State institutions are houses of refuge for women at Albion and Hudson, reformatory for women at Bedford, soldiers' and sailors' home at Bath, Craig colony for epileptics at Sonyea, home for feeble-minded women at Newark, home for orphan Indian children at Iroquois, industrial school, Rochester, home for feeble-minded children, Syracuse, home for soldiers' orphans at Oxford, hospital for crippled and deformed children at Tarrytown, school for the blind at Batavia, hospital for cases of incipient pulmonary diseases at Raybrook. There are schools for the deaf and dumb, and several private institutions which receive State aid, but are not wholly supported by the State. There are supported annually in county almshouses, during a single year about 16,000 persons. In city and town almshouses fully 70,000 are supported. During the same time about 210,000 receive temporary relief. The State expenditures for the institutions supervised by the Board of Charities for a single year are nearly \$20,000,000.

The Board of Lunacy has supervision of the State insane hospitals. They are located at Binghamton, Buffalo, Dannemora, Flatbush, Gowanda, Kings Park, Matteawan, Middletown, Ogdensburg, Poughkeepsie, Rochester, Utica, Wards Island (New York city), Willard, Ovid. There are about 30,000 patients in these institutions. There are also 20 private institutions authorized by the State board to receive insane patients. The private institutions, partially under State supervision, have over 1,000 inmates. The cost for maintenance and operation of the State insane asylums or hospitals is about \$6,000,000.

Penal Institutions.—The State prisons are located at Ossining (Sing Sing), Auburn, Clinton (Dannemora). The State reformatories are at Elmira and Napanoch; one for women at Bedford. Houses of refuge are at Albion and Hudson. The State penitentiaries (county institutions for short term convicts) are in the counties of Albany, Clinton, Erie, Kings, Monroe, and New York. The counties which do not have penitentiaries arrange with the penitentiary of some other county for care and support of those sentenced to such a place of detention and punishment. The following statement shows the number of convicts in the several State prisons September 30 in each of the last six years:

Prison.	1905.	1906.	1907.	1908.	1909.	1910.
Sing Sing.....	2,406	2,876	2,234	2,500	2,704	2,785
Auburn.....	1,145	1,063	1,139	1,406	1,390	1,417
Clinton.....	952	1,024	1,033	1,221	1,246	1,368
Women's.....	86	86	83	96	120	121
Matteawan.....	696	733	760	779
Dannemora.....	319	340	361	383

The following are the expenditures of the State prisons and hospitals for insane criminals for the year ending 30 Sept. 1910, for maintenance and ordinary repairs:

Sing Sing Prison.....	\$229,999.94
Auburn Prison.....	199,952.67
Clinton Prison.....	268,000.00
Women's Prison.....	34,800.00

Matteawan State Hospital.....	\$261,000.00
Dannemora State Hospital.....	90,721.62
Total.....	\$614,173.53

The abolition of the fee system in many of the counties, the more general application of the law of suspended sentence, the efforts to induce prisoners to reform, all have contributed to the decrease in the number of prison inmates. The system of instruction and training employed at Elmira is resulting in practical reforms. The parole law and the indeterminate sentence are being introduced into many other prisons. Capital punishment is still in force in the State; death by electricity, since 1880, has been substituted for hanging. Murder in the first degree is the only crime for which capital punishment is inflicted.

Legislation.—The most noteworthy recent legislative enactments, inspired for the most part by Governor Hughes, were: (1) a law prohibiting gambling at race tracks, passed in 1908; (2) a law authorizing additional railroad construction in New York City, passed in 1909; and (3) the creation of the Public Service Commission to exercise jurisdiction over all matters connected with public transportation. In 1910 an act was passed licensing and regulating private banking; the child-labor laws were amended by two acts so that now no minor under 16 years of age is permitted to work in any mercantile establishment, office, hotel, or as a messenger for more than 54 hours a week, nine hours a day, or between 7 at night and 8 in the morning. Among important acts of 1911 were the following: A law reappportioning the Congressional districts of the State; a direct State tax of \$6,072,763; a Direct Primary law was passed, providing for the direct nomination of all party candidates for public office except those voted for by the voters of the entire State, and also excepting town, ward and village officers and school directors and trustees. The candidates for State offices are to be nominated by State Conventions, but the delegates to these conventions are to be nominated by a direct vote.

Population.—Since 1820 the State has held first rank in population. The State receives the majority of the emigrants, of whom great numbers domicile. The number of foreign born, resident of the State in 1900, was 1,900,425, or nearly double the number in any other State. The population born in the State, but of foreign parents, was 2,415,845. There were the same year, 5,257 Indians, 7,170 Chinese, and 99,232 negroes. The urban population has increased more than the country. In the decade from 1890 to 1900, the rate of increase for the State was 21.2 per cent; the rate for the same year for the whole United States was 20.7 per cent. From 1900 to 1910 the rate of increase was 25.4. Pop. (1800) 589,051; (1810) 950,049; (1820) 1,372,111; (1830) 1,918,608; (1840) 2,428,021; (1850) 3,097,304; (1860) 3,880,735; (1870) 4,382,759; (1880) 5,082,871; (1890) 5,997,853; (1900) 7,268,012; (1910) 9,113,614.

History.—As the credit for the discovery of America belongs to one Italian, Christopher Columbus, the protégé of the far-seeing Queen Isabella of Spain, the credit for the discovery of New York is linked with the name of another

Italian, Giovanni da Verrazano, the Florentine, in the service of Francis I. of France. Verrazano's ship, *La Dauphine*, which left Dieppe with several others in the autumn of 1523, unquestionably sailed by Sandy Hook in the middle of April 1524; proceeded as far as Raritan Bay, when by stress of weather Verrazano was forced to return to the open sea and continue his journey to the eastward. While Spain's discovery of the Continent antedated the French discovery of New York by forty-two years, the French navigators anticipated the Dutch on the same lines by eighty-five years. The English who were the last to arrive had no part in discovering any of the land which is now known as New York, although eventually they controlled the entire territory from Florida northward.

French enterprise early determined the importance commercially and politically of the New World, although handicapped by the fierce civil wars that raged from 1560 until the accession of Henry IV. in 1594. The year made memorable by the Edict of Nantes, 1598, which secured freedom of worship for the Protestants, the Marquis de la Roche obtained a commission to conquer Canada. His expedition was a lamentable failure. Five years later De Monts, who had been commissioned governor of Acadia, brought a number of colonists to Port Royal, subsequently called Annapolis by the English, but after two years of hardships the settlement was abandoned, the pioneers returning to France. De Monts' commission, which had been revoked, was revived by a company of French merchants who entrusted their fortunes to Samuel de Champlain, a man who by education, ability and perseverance was thoroughly competent to execute the responsible trust committed to him. What William Penn was to the English court, that was Champlain to the French king, Henry of Navarre. He was a soldier and sailor of fortune; a sincere and devoted Christian. To him must be accorded the imperishable honor of being the first man who set his foot in New York, as he was the first to teach religion to the Iroquois. In 1608 he founded the city of Quebec. The twelve years' truce which acknowledged the sovereignty and independence of the Netherlands by Philip II. after their long and sanguinary struggle for liberty marked the beginning of a historic era in the New World. On the evening of 29 July 1609, Champlain at the head of a band of Montagnais Indians encountered a war party of Iroquois on the west bank of Lake Champlain near Ticonderoga in Essex County. The next morning the unfortunate Iroquois were introduced violently to gunpowder and the white man's sway and the white man's way opened on the Western Hemisphere.

On 3 September following, Hendrik Hudson sailed into New York Bay on the eighty-ton ship *Half Moon*, with a crew of eighteen men, half English and half Dutch. Hudson's son accompanied him. Hudson was an Englishman who had twice essayed to reach far Cathay by the Northwest passage. The Dutch East India Company, which was the pioneer company to take advantage of discoveries of new territory and whose powers were elastic for the colonization of new empires and the government thereof, persuaded Hudson by the offer of a seductive

pecuniary inducement to lend his ability and fearlessness as an explorer to their enterprise. Accordingly on the fourth day of April 1609, he sailed from Amsterdam to seek for the third time the passage to India by the north. Again he was thwarted by gigantic icebergs and impassable seas of frozen ice which blocked his way. He changed his course to the westward, passed Greenland and Newfoundland, and sailed South until he descried the promontory of Cape Cod. He designated the region beyond it New Netherlands and for a long time the Dutch considered Cape Cod as the northeast boundary line of their territorial possessions. Continuing on his way, Hudson made Chesapeake Bay, but from letters which he had received from John Smith he understood his countrymen were in possession by right of discovery. He put about and headed to the north. He discovered Delaware Bay and river which he christened the Dutch South River. He fixed the southern boundary of New Netherlands from that point. On the second of September the Highlands of Navesink turned up over the horizon to the north. For a week Hudson loitered in the vicinity of Staten Island, which he named—an object of curiosity to the Indians as his ship was of wonder to them. September twelfth Hudson sailed into the Upper Bay and de Groots River, which was called by the natives Shammuc or Mohicamituck, subsequently the North River, in contradistinction to the South and the East, and eventually the Hudson River in honor of the distinguished explorer who discovered it. Hudson had explored the neighborhood from Sandy Hook to Amboy, indulged in amiable converse with the aborigines, and proceeded on his course in search of the Northwest passage to India by the way of the Hudson River. It was only after eleven days' sail when he reached the end of navigable waters that he was compelled reluctantly to abandon the undertaking. With a deep feeling of disappointment he turned the prow of the *Half Moon* to the southward. The reports of his success, however, were forwarded to Holland and stimulated further enterprises in the way of exploring and colonization, while Hudson was detained at Dartmouth, England, whither he had put in, owing to the threatened mutiny of his crew.

The following year the fur merchants of Holland despatched another vessel to the River of the Mountains, which for the time was called the Mauritius after Prince Maurice, the stadtholder. In 1611 Hendrik Christiaensen of Cleves sailed for the same destination and returned with two young Indians, the sons of a Manhattan chief. In 1612 three Amsterdam merchants, Hans Hongers, Paulus Pelgrom and Lambert Van Tweekhaysen, sent two ships, the *Fortune* and the *Tiger*, to open up trade along the Hudson River. The *Tiger* was accidentally burned at Manhattan Island and Adriaen Block, its commander, during the winter of 1613-14, built a new vessel, the *Onrust*, of eighteen tons, the first to be constructed on Manhattan Island.

Two settlements had already been started in what is now the State of New York; one by Christiaensen on Castle or Patroon's Island, on the west bank of the Hudson a mile or two South of the present Albany, called Fort Nassau; the second on Manhattan Island, covering the space midway between the Battery and Rec-

for Street on the west side of Broadway. Blauk in the meantime had sailed away to the eastward in the vessel he had built, discovered the island which bears his name, drew a map of all the region, and in consequence secured from the States-General a charter for the "New Netherlands Company" under which he enjoyed the monopoly of trade in that region until 1623, when the charter expired. In the latter year the Dutch West India Company came into existence, with a charter granted by the States-General of Holland. Two years later additions were made and an act of amplification given. Under this charter, which was to endure for 24 years, the company was permitted to trade with the West Indies, Africa, and "other places"; all other inhabitants of the United Netherlands were prohibited from trafficking with those countries. It was permitted to appoint governors and other officers; to determine the forms of administering justice, to make treaties and enact laws. Their first packet, the *New Netherland*—under the superintendence of Cornelis Jacobsen May—which plied her ocean trade for thirty years, brought in May 1624 over thirty families, eighteen of whom established a settlement at Fort Orange near Albany under Adriaen Joris. Two years later two ships loaded with emigrants, agricultural implements and domestic animals, left Holland for Manhattan Island, where the company had decided to erect a larger colony and their headquarters for New Netherlands. With the later colonists came the director-general, Peter Minuit, who the following year, 1626, purchased the island of Manhattan, containing 22,000 acres, from the Indians, for 60 guilders, or about 24 dollars.

The Colony "boomed" from the beginning and the stock of the West India Company sailed upward. Under "the Freedoms and Exemptions" act, adopted in 1628, the company gave authority to every person who should send over a colony of 50 souls above the age of 15 years, the title of "patroon" and the privilege of selecting tracts of land, except on Manhattan Island, eight miles in length along the river and as far inland as he pleased. It was obligatory for the patroon to be a member of the company. He was looked upon as a feudal prince. His possessions were exempt from taxation for ten years. The colonists were prohibited from manufacturing woolen, linen or cotton cloth. Under authority thus conferred Kiliaen Van Rensselaer, of Amsterdam, a diamond and pearl polisher, obtained, through Sebastian Jansen Krol, who had come out with Jan Heyck two years before as "a consoler of the sick," a tract of land 20 miles in length, from Baeren Island to Smacks Island, and 24 miles on either side of the river "stretching two days' journey into the interior," constituting the greater part of the present counties of Albany, Rensselaer and Columbia. Michael Pauw purchased from the Indians, Staten Island and the land upon which Jersey City and Bayonne are now built. With the development of the land and trade the inevitable occurred. The patroons practically became rivals of the West India Company in the fur trade. As the business of the latter diminished the wealth of the former expanded. Minuit, unable to readjust the differences, was recalled. For two years the office was vacant. It was then

filled by Wouter Van Twiller, a name that has been rendered synonymous with farce, burlesque, contempt and arrogance. Van Twiller had married a niece of Van Rensselaer and was an administrator of fair parts. He began the construction of a new fort; he built the first church edifice; a bakery; a brewery; he substituted brick for frame houses and new windmills for old. But his plans failed to mature because of his peculiar disposition. Dominie Bogardus, who had accompanied him to this country in the same ship, stigmatized him as "a child of the devil" and threatened to "shake" him "from the pulpit as would make him shudder." Van Twiller was removed under charges in 1637 and left office, as did many of his successors, with a fortune he had accumulated in service. His successor was William Kieft, a man of slender abilities and an embezzler, whose ten years of service were conspicuous for strife—with the English and with the Indians. Like Van Twiller, Kieft was deficient in the art of conciliation. His position was too big for him to handle. He gives a discouraging report of the condition in which he found the colony; farms were barren of tenants and of cultivation or thrown into common; trading vessels in poor shape; houses out of repair; only one saw-mill out of three was in operation; the fort at New Amsterdam, for whose repair his predecessor had received 4,172 guilders, lay in a state of dilapidation and the magazine was scarcely discoverable.

The first English flag seen in the vicinity of New York floated from the vessel commanded by Captain Samuel Argall, the roving buccaneer, who in 1612 had captured Pocahontas and held her as a hostage for the good behavior of her father. Argall had been despatched in 1614 on an extraordinary expedition by Sir Thomas Dale, governor of Virginia, to dispossess the unfortunate French people who had settled at Acadia. On his return from this successful buccaneering expedition, Argall paid his respects to the Dutch. He proceeded up the Hudson River to Albany, forced a surrender in the name of the English king, and sailed away. New Amsterdam likewise submitted to Argall's demand, but as soon as his vessels disappeared through the Narrows, the Dutch flag replaced the English ensign as had been done at Albany. In 1633, Jacobus Eelkens, the Dutch commissary at Fort Orange, brazenly attempted to establish English trade on the Hudson, but the scheme was crushed at its inception. The New Englanders were not satisfied with their possessions but coveted the more prosperous settlements of the Dutch to the westward. In 1638 Kieft had issued a prohibition against the English trading at Fort Good Hope near the present Hartford, which had been built in 1623. Shortly afterward, owing to the insolence of the English, an order in Council was issued, to strengthen the post, to maintain Dutch supremacy. We first hear of English settlers in New York in 1640 on Long Island. They had crossed the Sound from Connecticut. When the English audaciously confiscated land, near Fort Good Hope, which the Dutch had prepared for planting, and brutally chastised farmers who tried to plant, Kieft threw a detachment across the Sound in retaliation and dispersed an English settlement at Oyster Bay.

But Kieft found more trouble on his hands.

NEW YORK

The Indians of New Jersey betrayed signs of restlessness toward the governor of New Netherlands; he was threatened by the Swedes at the south; he realized the unfriendliness with which the cavaliers of Virginia, Maryland and Delaware regarded his colony; he could expect no favors from the Puritans on the east. At this crisis he unwisely provoked a quarrel with the Indians by demanding tribute in maize and fur on the ground that the Dutch had supported them in defense of their enemies. From the day Champlain introduced gunpowder to the savages on Lake Champlain, the red man of the forest had sedulously and successfully cultivated its acquaintance. So that when Kieft imprudently attempted to suppress the sale of guns and their accessories to the Indians, turbulence broke loose along the New York frontier. For three years the bloody strife continued, during which the Dutch in New Amsterdam were driven for protection under the guns of the fort and were reduced to much distress by the aggressive operations of the Manhattans, from the north, the Long Island Indians from the east and Delawares from the south and west. Roger Williams brought about an interview between Kieft and the sachems, but the peace which followed was of brief duration, for hostilities were resumed more savagely than ever before the end of the year. The Indians were bent upon a war of extermination of the whites. They felt their power, the force of their numbers and were thirsting for revenge. "When you first came to our shores you were destitute of food," exclaimed a Sachem before a treaty council. "We gave you our beans and our corn. We fed you with oysters and fish. And now for our recompense, you murder our people."

In 1643 "the first germ" of our Federal Constitution was planted by the formation of a league for self government and common defense by the colonies of Massachusetts, Plymouth, New Haven and Connecticut. For the time it was a powerful organization. To it, Kieft appealed in vain for aid, to carry on his Indian war. The confederacy was organized as much to make aggressions upon the thrifty Dutch as for defense against the Indians. Matters were going badly for Kieft until he solicited the support of Captain John Underhill, a valiant warrior, under whose skill and energy, an able-bodied force was raised, which encountered and defeated the Indians in several pitched battles. Peace was eventually assured in 1645 through the intervention of the Iroquois. Kieft failed to profit by the lesson. The act that led to his recall was the most infamous in Dutch Colonial annals. Without the slightest provocation, he crossed to the west bank of the Hudson, with the soldiers from the fort, a mob from the streets, and privateersmen and sailors from the harbor. Under cover of darkness he fell upon a band of peaceable and unsuspecting Indians at Pavonia and massacred men, women and children indiscriminately. Kieft left for home with a fortune. The ship was wrecked off the coast of Wales and governor and fortune went down together.

We now come to the much misrepresented and misunderstood Petrus Stuyvesant who arrived at New Amsterdam 27 May 1647, two years after his appointment as director-general. Stuyvesant was the son of a Friesland clergy-

man, had been educated to the army and navy as well, had lost a leg in the attack on the Portuguese island of Saint Martin and wore as a substitute a wooden one, that was girdled with silver bands. He was 45 years of age, overbearing in manner, autocratic in speech, prompt and decisive in action and a devout churchman. He conscientiously attempted to carry out the instructions that directed him to guard against aggressions on the colony's boundaries, to preserve peace with the Indians and to stimulate the growth of villages by the colonists. He found the colony much out of repair and the colonists next to demoralized. The dominating spirit that pervaded the West India Company and all that were connected with it, to the colonists themselves, was personal gain. New Amsterdam and Fort Orange or Aurania as it was sometimes called, were flooded with an aggregation of unscrupulous merchants and traders, who robbed the Indians on one side and their customers on the other. The example was established by succeeding directors-general and the plain people emulated that example. Stuyvesant inherited the turbulence and the dissatisfaction left by his predecessor and struggled with it courageously and with a hand so firm as to incite unpopularity among many whose plans he thwarted. A year before his arrival, Kieft had served notice on New England that the English "without provocation" had invaded New Netherlands, usurped divers places, done injuries and not given satisfaction, and that unless reparation were given "such means as God affords" shall be employed "manfully to redress ourselves." Stuyvesant for five years diligently attempted to establish pacificatory measures with the most powerful rivals of the Dutch, the English, and finally in 1650 by repairing personally to Hartford secured a treaty that fixed Oyster Bay, on Long Island, the western boundary of the New Englanders and Greenwich on the mainland.

In the meantime internecine quarrels aroused all the choler and tyranny in his nature. Without funds, the internal improvements he had in contemplation could not be carried out. He had seen how Kieft had quarreled with his "Eight Men," and as a concession for his taxation scheme he ordered an election, allowing the settlers in Manhattan, Brooklyn which had been established in 1645, Amersfoort and Pavonia, to elect 18 individuals from whom the governor and his council should select nine, who were to confer with the director on all measures tending "to promote the welfare of the commonalty and the country." Between the director and "the Nine," dissensions arose over finances. The latter refused to provide money for the repair of the fort, claiming the Company was responsible for that expense. They objected to Stuyvesant's management; complained of the heavy assessment levied upon trade, and when he peremptorily refused permission for the people to assemble, they made a house to house canvass. The director ordered delegates from the militia and "the Nine" ordered a journal to be kept by one of their number, Adriaen Van der Donck, and forwarded eventually to the home authorities. Stuyvesant blazing with wrath arrested the writer, threw him in prison on the charge of libeling the government and seized the papers. The controversy was carried

NEW YORK

with more or less acrimony on both sides to Holland; petitions were despatched across the sea complaining of the unreasonable and arbitrary exercise of power by the director. Stuyvesant in the meantime played into the hands of his enemies by his reduction of the Swedish possessions in Delaware. As the dissatisfaction of the Dutch burghers against him expanded, sympathy for him on the part of English settlers increased. He had established a weekly market in New York; in 1652 the city was incorporated; a year later the palisades were constructed to the north of the present Wall Street from the East to the North River; four years later citizenship was created and the city was surveyed, streets were regulated and named and several of them paved.

Under Stuyvesant's administration religion was encouraged and fostered. As early as 1626, Sebastian Jansen Krol and Jan Huyck who had originally sailed to the country as "consolers of the sick" are found, on the Sabbath, reading texts out of the Scripture and the creeds to persons who would attend. Two years later, in 1628, Michaelius, a minister of the Reformed Church, organized the first Dutch church in the New Netherlands with 30 communicants. In 1633 arrived Everardus Bogardus who sailed to this country on the same vessel with one governor, Van Twiller, to return home on the same vessel with another, Kieft, only to meet his fate at sea. His quarrels with both have become historical. Along in 1640 Dominie Johannes Megapolensis preached in the church which Kieft had built within the fort, before proceeding to his charge at Fort Orange, the present Albany. The Reverend Johannes Backerus, formerly a clergyman at Curaçoa, in 1647, superseded Dominie Bogardus in the pastoral charge of the Dutch church. New York had not escaped the wave of religious intolerance that had rolled over Europe during the preceding half century. An ordinance was adopted by the Dutch in 1640 that prohibited the exercise of all other religions except the "Reformed as it is at present preached and practised by public Authority" in the United Netherlands. The following year, however, this bigoted mandate was temporarily revoked. Father Jogues, the first Catholic missionary to New Netherlands, found that the colony harbored Catholics, English Puritans, Quakers, Lutherans, Anabaptists termed "Mnisters" (the Mennists or Mennonites) and Dutch Reformers. He reported an order was in force denying "public worship" to all but Calvinists. In 1654 the application of the Lutherans to erect a church in New Amsterdam was refused; "no doctrine shall be encouraged in the colony" but "the true reformed," ruled the director-general. The English settlements repudiated the teachings of Megapolensis who in 1649 had succeeded Backerus and who claimed the Classis of Amsterdam in Holland exercised spiritual jurisdiction over the colony. Quakers were arrested, beaten with ropes, were fined and imprisoned for their presumption in preaching their heresies.

The outbreak of war between Holland and England called in play all of Stuyvesant's great ability as an executive officer. The city was put in a state of defense. He had established the city of New Amsterdam and appointed the burghmasters, the schepens and fiscal. He now attempted to adjust affairs with New England

but in vain. Indian outbreaks excited the colony for several years. An uprising near New Netherlands was followed by massacres at Pavonia, Hoboken and Staten Island. In three days 100 Dutch colonists were killed, 150 were taken prisoners and a financial loss of 200,000 guilders, \$80,000, was sustained. Devastations at Esopus and the destruction of Wiltwyck were not the least disturbing problems he encountered in dealing with the Indians.

In the meantime the villages of Jamaica and New Haerlem had been created; a municipal court was established at Esopus, known as Wiltwyck; Arendt van Curier, long loved and trusted by the Indians as "Corlaer," had purchased the great flats at Schenectady and the colony was spreading forth like a blossoming plant, north, west and southwest of Albany.

The aggressions of the "malignant English" had been a source of annoyance to the Dutch for years. Cromwell at one time threatened to seize New Netherlands. In 1657 the commissioners of the United New England Colonies conceded Oyster Bay and Huntington to the jurisdiction of New Haven and three years later Huntington and Seatauket. In 1662 Connecticut laid claim to Westchester in spite of the provisional treaty. Charles II. had granted to the younger Winthrop, Massachusetts Bay, including Connecticut, and to his brother James, New Netherlands; the fact that a great part of this territory was not his to give, but belonged to the Dutch, was not included in the consideration in the least. About this time John Scott appeared on the scene. He produced orders for the stringent enforcement of the British navigation laws in the colonies, claimed that Long Island belonged to the Duke of York and proceeded to place the English Long Island towns under one organization, of which he was elected "president." When he attempted to seduce the Dutch towns he encountered the strong arm and the stubborn will of the director-general. The contest was acrimoniously conducted, was protracted and only ended by the appearance, 29 Aug. 1664, in the bay, of the English fleet under Colonel Richard Nicolls, who had been ordered by his royal master, the Duke, to take possession of the Dutch province, to reduce the Dutch to entire obedience, "to put them out of capacity of doing such mischief" as they had perpetrated in other quarters. It was repugnant and mortifying to Stuyvesant's courage to surrender his charge without firing a shot and, like a soldier of high spirit, he prepared to make determined resistance, in spite of the appeals of the city authorities and the clergy. "I would much rather be carried out dead," he exclaimed. Stuyvesant appealed in vain for help and for several days cleverly delayed the inevitable. He only yielded when Nicolls entered the harbor with his ships and an overpowering force, and he regretfully signed the articles of capitulation that had been agreed to by the magistrates. On 3 September, New Amsterdam became New York in honor of the Duke, the name of the fort was changed to James, also in honor of the Duke and three weeks later Fort Orange surrendered and was called Albany, in honor of the Duke. One of the inconsistencies conspicuous in the seizure of New Netherlands by the English is that at the time peace prevailed between England and Holland.

NEW YORK

The province received the name of New York. Its population was estimated from 6,000 to 10,000 souls. Municipal officers continued in power, but no more elections of magistrates were to be held by the people. Stuyvesant had insisted upon the guaranty of property and civil rights and freedom of worship—the Church of England Service to be held in the Dutch church at New York upon the termination of the service of the Reformed Church. Court proceedings were to follow English models. The province felt the direful effects of the next ten years of European wars. On 30 July 1673 with war under way between Holland on one side and France and England allied, a Dutch fleet under Cornelis Evertsen and Jacob Benckes suddenly appeared off Staten Island. Captain John Manning, in the absence of Governor Francis Lovelace, who had succeeded the Duke of York's personal representative, Colonel Nicolls, was not disposed to offer resistance, for his soldiers refused to fight and his own people spiked his guns. He surrendered, and the name of New York was temporarily changed, and that of the fort to "William Hendrick." Anthony Colve was proclaimed governor of the province. Under the treaty of 1674 New York was restored to the English. Sir Edmund Andros, an intelligent and wise officer, was appointed governor. In 1678 he describes the province as containing 24 towns or villages with 20 churches, specifies its products and exports as provisions, tar, furs and lumber, fixes the value of estates at £150,000, and the number of men capable of bearing arms at 2,000. Under his regime the navigation act was enforced; friendship with the Indians was cultivated to neutralize the influence of the French; a classis of the Reformed Church was established 1679 in New York to ordain ministers, and the governor endeavored to individualize New York as "the most English in sentiment of the American Colonies." Owing to disputes with New Jersey, complaints were filed against Andros with the home authorities. He was recalled, and exonerated; in 1688 he returned under a viceregal government to consolidate the Northern colonies. In the interim the office had been filled by Thomas Dongan, an Irish soldier, a Catholic and a discreet and conservative leader. He brought instructions to issue writs for an Assembly; and the people now saw in reality the culmination of hopes begun during Stuyvesant's time—the possibility of popular franchise. Accordingly 17 Oct. 1683 the representatives of the people of New York met for the first time in Assembly in New York city. The sessions continued until 3 November. It was ordained that Assemblies should convene triennially. In 1685 a charter was granted to New York and in 1686 to Albany. The hopes of the colonists for better things were dashed to the ground; the Assembly promised by the Charter of Liberties and Privileges never convened, for in February 1685, Charles II. died, his brother James the Duke ascended the throne and as James the King repudiated the acts of James the Duke; the charter was vetoed, and the Assembly abolished. Dongan had fallen under the royal displeasure by his failure to push forward the doctrines of the Church of Rome and was recalled.

Governor Andros was in arrest at Boston when the news arrived that James had been

dethroned and the lieutenant-governor, Francis Nicholson, lacked energy and decision for the crisis. People moreover distrusted him. Wild and exciting rumors were abroad in the land. Stories were circulated that the Catholics were to join hands with the French and overturn the existing order of things. Jacob Leisler was a prosperous merchant and captain of one of the train bands. He had been born at Frankfort and had seen service in the German army. The people turned to him. But the three councillors remained loyal to Nicholson. Leisler and his friends, fearful of the intrigues of the Catholics, proclaimed William of Orange, king. Ten members of the Assembly were appointed by Leisler as a committee of safety, and Leisler was declared by them to be governor. He carried his authority with a high hand. He usurped the functions of the lieutenant-governor and claimed the title; he opened letters addressed to Nicholson and arrested and imprisoned those who refused to obey him. When French invasion upon the destruction of Schenectady in 1689 was imminent, he displayed great energy, declared himself as the acting governor and forced recognition from Peter Schuyler, mayor of Albany, who had resisted the authority of Jacob Milborne, son-in-law of Leisler, whom he despatched up the Hudson with an armed force to subdue the thriving city. On the strife between Leisler on one side and Captain Richard Ingoldesby and Colonel Henry Sloughter, who had been appointed governor by William and Mary on the other; on Leisler's imprudent actions, it is not necessary to dwell. Eventually he was forced to submit. Pursued by vindictive enemies, he and Milborne died as martyrs. Sloughter, stupefied with rum, signed their death warrants and they were hanged near the site of the present World building in New York city 16 May 1691. Leisler was unquestionably a sincere but misguided man. Four years later Parliament reversed the attainder of Leisler and his associates. Lord Bellomont, afterward the enlightened governor of the province, declared that Leisler and his son-in-law were "not only murdered but barbarously murdered."

The history of the province for the following 84 years is conspicuous for brawls between the governor and the Assembly; for efforts to disseminate the doctrines of the Episcopal Church and to weaken the influence of the French and of the Catholic Church; to develop the land and the fur trade; to increase the growth of the towns, to preserve peace with the Indians; to cultivate privateering, and to wink at piracy; to reconcile differences with neighboring colonies. Much depended upon the sincerity, honesty and integrity of the governors. In the whole line of administrators from Nicolls to Tryon, under English rule not more than three governors can be cited in whom those three traits can be found. The governor's power was absolute. He not only made the laws but interpreted and executed them and when necessary unmade them. He usurped the prerogatives of the Assembly and of the courts; his Council were mere automatons who danced when he pulled the string. No act of the Assembly was placed on the statute book without his signature, and no decision of the court was valid until he, as chief justice, passed judgment; and in this respect he exercised powers denied to the king for his

NEW YORK

majesty, while permitted to sit on the king's bench, was prohibited from expressing judgment. Time and again the governor was threatened with removal; now and then charges were preferred against him and once the grand jury was urged to indict him for high treason. It is a sad commentary on the record, that every colonial governor who took office poor left office a wealthy man. There were three notable exceptions, the Irish earl, Lord Bellomont; Robert Hunter, the friend of Addison and Swift; and William Burnet, son of the bishop of Salisbury. The province had already become the haven of the persecuted of foreign countries. Between the years 1678 and 1696 the population of New York city had nearly doubled—from 3,400 to 6,000, that of the province had increased to nearly 30,000. The infamous practice of transporting felons to America and the degrading slave trade produced the most pernicious effects upon the cause of labor, stamping it with the stigma of disgrace in the one instance and involving a contraction of wages in the other.

Under General Hunter was tried the experiment of colonizing the Palatines. The scheme originated with English politicians who saw in it vast profit in developing the British commercial resources at the same time menacing French supremacy by strengthening the frontiers. Settlements were established first at Livingston's Manor, and subsequently along the Mohawk and in the Schoharie region. The experiment involved a loss of £100,000 to its projectors.

In 1732 occurred the memorable struggle between Rip Van Dam, the senior councillor, and Governor Cosby. The original cause was puerile and insignificant, and involved only a few pounds, a fraction of the salary Van Dam claimed during the 13 months he acted as governor, it culminated in one of the most glorious episodes in history and established the principles for the freedom of the press in this country for all time, through the courage of John Peter Zenger, editor, and the brilliant scholarship of Andrew Hamilton, his advocate in the famous trial for libel. Nine years later, the province was thrown into paroxysms of alarm over the so-called "Negro Plot." Several mysterious fires occurred in New York about the same time and the impression got abroad that negroes had kindled them with the ultimate determination of burning down the town. The only basis for the suspicion was the unsupported testimony of an ignorant immigrant woman who was bound out to the keeper of a disreputable resort. Every negro became a suspect and large rewards were offered for the conviction of an incendiary. Before the frenzy ended, under the judgment of the court, 13 unfortunates were burned to death, 18 were hanged and 70 transported.

For years, more or less apprehension prevailed over French invasion. The French wielded greater influence over the Indians through religion and princely presents. Settlements had been established at Oswego and at Niagara, and the governors were periodically at their wits' ends to protect them. November 1745, instigated by the French, a band of redskins rushed upon Saratoga—after Fort Hoosick had surrendered—killed the brother of Peter Schuyler and a number of others, spread destruction over the surrounding country

and carried off to Canada a number of captives. The Assembly of New York then followed the example set by Massachusetts and offered a bounty for Indian scalps. England had been remiss to a degree in neglecting even ordinary protection for its settlers. The home ministry permitted France to fortify and hold Crown Point, in spite of the protests from the province, whence war parties darted on their incursions of devastation, desolation and death.

Governor Clinton who succeeded Clarke as governor in 1743 was a sailor by profession and carried into the office all the old time martinetism of the quarter deck. He attempted to overcome England's handicap with her redskin neighbors. In August and September 1746 he held a council at Albany with the Iroquois with the intention of establishing an alliance and to counteract the marplotting of the French and the Jesuits. To strengthen the bonds of friendship and as an effective object lesson, Sir William Johnson, the English Indian agent for New York, appeared in the full garb of a savage, paint and all, and walked as an Indian chief at the head of the Mohawks. Owing to the illness of Governor Clinton, Cadwallader Colden explained to them that the French had been defeated at Annapolis; and that troops from Massachusetts, Connecticut and New Hampshire had captured Louisbourg. He informed them that the English king had sent troops enough to take Canada from the French and urged them to join the English in the undertaking. Oration were thereupon delivered, belts exchanged and presents divided; the Indians gorged and guzzled, warbled and danced, and agreed to join the English procession, and the northern part of the province was overrun with war parties who scalped and spattered blood, of male and female, young and old, the strong and the helpless, with unbridled ferocity. Governor Clinton accumulated a princely fortune during his ten years' service as governor and could well afford to quarrel with his Assembly, as several of his predecessors had done over the permanent support bill. His successor, Sir Danvers Osborne, hanged himself with his handkerchief 12 Sept. 1753, five days after his arrival in New York.

James DeLancey, lieutenant-governor, one of the best equipped men in the province for the position, succeeded him. He had been born in Albany and was the first governor to the manner born. He presided over the Congress at Albany in 1754 that contemplated union among the colonies, and opposed the plan. The treaty of Aix la Chapelle was a dead letter so far as the colonies were concerned, for French aggressions were more exasperating than ever. With the outbreak of the French and Indian war, Sir William Johnson, who had married the sister of the Indian chief Joseph Brant, and who never had commanded a company of troops on the field, was placed at the head of a force of 3,400, who marched to the northward. At Lake George on 8 Sept. 1755, occurred the battle which brought a baronetcy and a fortune to Johnson, deprived the officers who really won the victory of credit, led to the death of the celebrated Mohawk, Hendrick, and put to rout the French forces under the accomplished French general, Dieskau.

The main incidents in the French and Indian

NEW YORK

war were the capture of Fort Oswego by the French general, Montcalm, 14 August 1756; the surrender and massacre at Fort William Henry at Lake George on 9 August 1757 where Montcalm with 8,000 French and 2,000 Indians overcame the garrison of Colonel Monroe of 3,000 men; the surrender of Fort Frontenac to Col. John Bradstreet, and the surrender of Fort Niagara to the English 20 July 1759.

The birth of liberty in the State of New York practically occurred in the Colonial Convention to consider the Stamp Act, 7 Oct. 1765. With the accession of George III., 25 Oct. 1760, a new conflict broke out between the colonists and the authorities. All commissions expired with the sovereign. It was now contemplated to permit the judges to hold office only "during his Majesty's pleasure" instead of "during good behavior." Up to 31 March 1774, when the Boston Port Bill became a law, agitation throughout the provinces had become more and more pronounced and the people more and more unsettled. The battle of Golden Hill in New York city in 1770 had inflamed the public mind to the possibilities, and the representatives of the Crown in their constant collisions with the Sons of Liberty over the destruction of their liberty pole contributed naught in diminishing the drift of popular sentiment. On 23 May 1774, New York published its declaration of rights at France's Tavern in New York city. Two months later delegates were chosen for the first Continental Congress which convened in Philadelphia 17 Sept. 1774. On 1 May 1775 the committee of 100 was appointed as the successor of the New York Committee of Correspondence and the Committee on Inspection, respectively. The constitutional government had gone out of existence. The sentiment of the English party in New York city was naturally in sympathy with England; the old Dutch settlers, with their bitter remembrance of the 100 years of English rule, were almost unanimously in favor of revolution, but when the second Continental Congress convened in Philadelphia 10 May 1775, and the country had tasted all the horrors of war, there were members, especially from New York, who were still hopeful that the manifold grievances might be redressed. Grave events were happening with great rapidity. Fort Ticonderoga had been surprised and captured by Ethan Allen and Benedict Arnold 10 May; two days later Crown Point surrendered; within a week Arnold had captured St. Johns, Canada, and William Tryon the last English governor, who five years before had succeeded Lord Dunmore, sought refuge on the British gunboat Asia in the harbor of New York. Throughout the war New York was the real battle ground; topographically and strategically its position was recognized as of the utmost value to English and American as well. The English plan of campaign was based upon that of the French of 1689 and of Montcalm in 1757; namely, to break the back of the province by an invasion operating from the north and from the south along the valley of the Hudson. It was this objective that brought Burgoyne to America in the summer of 1777, when the American forces and American people were disheartened by successive defeats that included the battles of Long Island and the evacuation of New York city; the de-

feat at White Plains and surrender and massacre at Fort Washington. Three of the most important battles of the Revolution were fought on the soil of New York; that of Oriskany, 6 Aug. 1777, which practically shattered the right arm of Burgoyne, and that of Walloomsac, for many years mistakenly called Bennington, which shattered his left arm, both of which contributed immeasurably to the culminating defeat at Saratoga where the first British army in the history of England lay down its arms to an army composed of farmers.

Sir Henry Clinton had started from New York only too late to assist Burgoyne and had captured Forts Clinton and Montgomery in the Highlands of the Hudson 6 October, eleven days before the surrender. On 16 Oct. 1777, the British Colonel, Vaughan, ascended the Hudson to Kingston, which was burned without the slightest provocation, leaving a stigma upon the British name for pure vandalism that has never been effaced.

With Burgoyne's surrender, New York State was relieved of large standing armies, but was called upon to encounter straggling foes that menaced the frontiers and exposed towns to the close of the war. During the campaign of 1776 the safety of the people was indubitably secured by the tireless energy and countless resources of General Schuyler, but with his retirement from the Continental army as commander of the Northern District, the frontiers were left to shift to a large extent for themselves, and the Indians under Brant with the Tories under the blood-thirsty Butler swept over them with torch and scalping knife, meeting with feeble resistance until Congress and General Washington selected John Sullivan to destroy their crops and burn their villages from the Chemung to Niagara.

In October 1780 the Schoharie and Mohawk valleys were ravaged by a force of 800 Indians and Tories under Sir John Johnson. With the exception of the slight skirmish at Johnson Hall where Col. Marinus Willett put the enemy to rout, New York saw no more active fighting except sporadic brushes here and there between the militia and straggling bands of Indians.

The constitutional history of New York dates from the adoption of the Declaration of Independence. The Provincial Congress which had been elected in April met in the city of New York 14 May 1776. Before the convention adjourned the subject of independence was considered, and it was resolved that it was the sense of the Colony that the people desired to continue dependent upon Great Britain. As soon, however, as it was known that the Continental Congress recommended that each colony should establish its own form of government, a decided change of sentiment occurred in New York. When the newly elected convention assembled at White Plains 9 July 1776, the old regime had ceased to exist, and the New York Congress became "the convention of the representatives of the State of New York," the Declaration of Independence was speedily ratified, and a committee was selected of which John Jay was chairman, to draft a constitution for the State of New York. The enemy seriously interfered with the plans of the Convention. New York had been abandoned. The British men of war patrolled the harbor within seven miles of the place where the constitution framers were

NEW YORK

at work. Courts of law had been abolished, but the Convention ordered that all magistrates and civil officers who were affected toward independence should continue to exercise their duties and that processes hereafter must issue in the name of the people of the State of New York.

The draft of the constitution was submitted 12 March 1777. It was adopted 20 April and an election was ordered to be held in June. The sentiment of the constitution was decidedly English and its tone was aristocratic. It discredited the office of governor and it distrusted the people. Its abiding faith in the judiciary stands out in a strong light. It was liberal in its religious sentiments in that it permitted "the free exercise of religious profession and worship without discrimination or preference of all mankind." Slavery was still supported, although Gouverneur Morris and John Jay, who had been most instrumental in drafting the instrument, had attempted to move for its gradual obliteration. Its two weak features were the Council of Appointment, which was supposed to be a check upon the governor, and the Council of Revision, which was supposed to be a check upon the legislature. The Constitutional Convention of 1801 was called to determine the jurisdiction of the governor and the Council of Appointment in the matter of patronage. The decision of the Convention divided the responsibility equally between the four Senators who constituted the Council of Appointment and the governor. The two obnoxious councils, Revision and Appointment, were abolished by the constitution of 1821 which at the same time enlarged the area of the elective franchise by removing the property qualification. The weakness of the articles of confederation that had become apparent within a year of their adoption, threatened to shipwreck the country unless a strong form of government was organized and substituted in its place. General Washington and Alexander Hamilton had been agitating the necessity for a more powerful and cohesive instrument. On 17 Feb. 1787, the Assembly of New York adopted joint resolutions instructing the delegates of the State in Congress to move that a convention be held for the purpose of amending the Articles of Confederation so as "to render them adequate to the preservation and support of the Union."

Messrs. Robert Yates, John Lansing, Jr., and Alexander Hamilton were appointed delegates to the Federal constitutional convention which met in Philadelphia on the second Monday in May 1787, and which concluded its work 17 September. Messrs. Yates and Lansing withdrew and Hamilton was the only delegate from this State who signed the new constitution. The State convention to act upon the new constitution convened at Poughkeepsie 17 June, and adjourned 26 July. Ten of the thirteen States had ratified the Constitution—one more than the number necessary—with New York rebellious. George Clinton, governor of the State from 1777-95, appeared as the most resourceful opponent of the new Constitution and led the anti-federalist forces on the argument that New York was too powerful and wealthy to place herself on a par with States not her equal in income and resources. Alexander Hamilton and Robert R. Livingston were the strongest advocates of the new Constitution. In July notification was

officially made that Virginia and New Hampshire had approved the new Constitution, and the Federalists thereupon offered a resolution "that the Constitution be ratified in full confidence that the amendments proposed by this convention will be adopted." The resolution was adopted 30 to 27, eight members, including Governor Clinton, declining to vote. From this time forth two parties existed in the State of New York, the strict and the loose constructionists. The State of New York, owing to the failure of the legislature to agree in the choice of electors, lost its vote for President at the first election under the Federal Constitution.

The first political struggle in the State occurred in 1792 over the election for governor, when Governor Clinton by a fluke defeated John Jay. New York had experienced a number of disputes with her neighbors over boundary jurisdiction, especially with New Jersey, Vermont, New Hampshire and Massachusetts. New York was the first of the States to cede lands belonging to her to the United States for the encouragement and development of immigration. Within a space of seven years, 5,500,000 acres of land within the State had been thrown open to settlers, bringing to the State treasury \$1,030,433. Population fairly jumped, and it was necessary to create a number of new counties north and west of Albany. Internal improvements, turnpikes, and the development of waterways were constant subjects of discussion, and these subjects received an extraordinary stimulus in 1807 when Robert Fulton made the first trip with his steamboat on the Hudson River between New York and Albany. Three years later a commission was appointed to survey a route for a canal to Lake Erie. On 16 April 1816, commissioners of construction were appointed, and in 1817 commissioners of the canal fund were organized. As the construction of the canal proceeded a number of counties were opened to the right and left, and when the canal was completed in 1825, the population of the State had increased to 1,500,000.

Up to the outbreak of the second war with Great Britain, political struggles in New York were marked by fierce acrimony. Never was hostility more bitterly displayed and personal vituperation carried to greater excess. Hamilton had fallen in the duel with Burr, and from that hour dueling was banished as a social evil in the State of New York. The Clinton family, the venerable George, who had been a candidate for President against Madison, through the wire pulling of his brilliant nephew DeWitt Clinton, had been elected vice-president, and opposed the Federal administration of President Madison, whose New York representative seems to have been Governor Daniel D. Tompkins, an adroit politician and an able man.

At the opening of the presidential campaign of 1812, DeWitt Clinton aspired, through his Republican affiliations, for the presidential nomination and was nominated by a number of his friends in New York city; but on 18 May, President Madison was unanimously nominated. When Congress declared war in June, the President issued a patriotic proclamation which rallied to his support the entire Republican party and forced Clinton to abandon his own party and consort with the Federalists.

During the second war, Governor Tompkins

NEW YORK

stands out as strong a character as George Clinton during the War of the Revolution, and like the first war governor of the State, he was selected, in honor of the distinguished services he had rendered to his party and State to serve as vice-president of the United States with James Monroe from 1817 to 1823, during "the era of good feeling."

Judge Tompkins presided over the Constitutional Convention of 1821. With the adoption of this Constitution, the Federalist party went out of existence for all time. New York State, and the new conservative element under the leadership of Martin Van Buren and DeWitt Clinton took charge of the party machinery.

It was during the term of DeWitt Clinton as governor that the anti-masonic craze swept the State and largely influenced national politics by the disappearance of William Morgan from Canada, 12 Sept. 1826. On 4 July 1827, by legislative enactment, slavery was abolished. Governor DeWitt Clinton died suddenly at Albany on 11 Feb. 1828 and his successor, Martin Van Buren, resigned in order to become secretary of state in the cabinet of President Jackson.

Under the administration of Enos T. Throop, who acted as governor until the regular election in 1830 when he was chosen governor, the manufacture of brick by machinery was begun in New York; the *Albany Evening Journal* was started by Thurlow Weed; the first omnibus was built and used in New York city; the Albany and Schenectady Railway was opened; chloroform was first obtained at Sacket Harbor; the Whig party was formed; the first horse street railway in the world was opened on Fourth Avenue, New York city; and the anti-slavery society of New York was organized. William L. Marcy who succeeded Mr. Throop, resigned his seat as United States Senator upon his election as governor, was a rabid partisan and rigid economist and favored moderate protection to home industry. He advocated internal improvements and after his re-election in 1834 recommended enlargement of the Erie canal and approved the construction of the Black River and Genesee Valley canals. The city of Albany now was recognized next to Washington as the political storm centre of the Union for her reputed "Albany Regency," which for years made and unmade candidates, controlled legislation and ruled the party and the State with arbitrary and at times high-handed methods. Mr. Van Buren was responsible for the breaking up of President Jackson's cabinet by his open recognition of Peggy O'Neil; his rejection by the United States Senate as minister to England by the casting vote of Vice-President Calhoun, would have led to a general dissolution of the Democratic party had it not been for the resolute individuality of President Jackson.

New York suffered with the rest of the country by the panic of 1837, which originally can be traced to the removal of the deposits from the United States Bank in 1833, and by the deluge of "shinplasters," as a consequence of legislative prohibition of bank bills under the denomination of five dollars. The election of President Van Buren was immediately followed by the financial disaster, a calamity which arrayed against the State and national administrations the entire banking and financial institutions

of the entire country; that opened the way to the election of William H. Seward, the first Whig governor, in 1838, and two years later of William Henry Harrison on the "Tippecanoe and Tyler too" platform, the first Whig President of the United States. So demoralized were the finances that in 1841 the State was unable to borrow money to pay contractors upon the canals, and in 1842 a law was passed suspending work and providing for the raising of money by taxation. The Erie railway which secured a charter in 1832, which obtained from the legislature in 1836 a loan of \$3,000,000 and which by 1840 was completed as far as Goshen, was abandoned, the company made an assignment, and it was not until 1851 that the road was completed. Public works of all character were suspended and discouragement and depression were paramount.

During the next decade through the administrations of Governors Bouck, Silas Wright, Hamilton Fish and Washington Hunt, the anti-rent troubles were a very prominent disturbing factor in the State, and the question of slavery throughout the country began to assume proportions that pointed inevitably to war. The Constitutional Convention of 1846 was held at the height of the demand of popular sentiment for the limitation of the power of the governor and of the legislature and for the extension of the elective franchise. The Convention abolished the court of chancery, limited the power of the legislature over the revenues, stripped the legislature of the power to appoint general administrative officers of the State, and substituted general laws for the organization of business corporations instead of special legislation. In consequence a great impetus was given to the organization of banking, telegraph, insurance and railway companies to conform with the prodigiously expanding institutions of the State.

The split in the Democratic party, owing to the slavery problem, and the rapid growth of the Free Soil movement in New York, decided the election of General Taylor for President in 1848 and the election of Hamilton Fish as governor. The Whig party in turn was torn by dissensions in 1850 when Washington Hunt was elected governor over Horatio Seymour, and two years later when Seymour carried the election, was a natural consequence of the condemnation of the people for the Compromise measures in Congress. The Whig party ceased to exist as a factor after 1852. With the exception of the slight disturbances in the State over temperance legislation, national politics monopolized the attention of politicians until 1857. In the meantime the American party and the Republican party came into existence. The agitations in Kansas and Nebraska, with the reckless threats of the Southern leaders in Congress, opened the eyes of the most sagacious to the possibilities of war between the sections of the country. The panic of 1857 produced a temporary set-back to the rapidly growing prosperity of this State. When Edwin D. Morgan was elected governor in 1858, the most active parties were the Democrats, the Americans, the Abolitionists and the Republicans. Governor Morgan was re-elected in 1860 on the same ticket with Abraham Lincoln, who had defeated New York's favorite Senator, William Henry Seward,

NEW YORK

for the nomination for President at the Chicago convention.

On 12 April 1861 Fort Sumter in Charleston Harbor was attacked. On the 15th President Lincoln issued a call for 75,000 volunteers to defend the life of the Union. The Union Defense Committee of New York was organized that evening. Within ten days 7,334 men were on their way to Washington—the first regiment to respond to the call was the 7th New York, Colonel Leffert's. April 16th the legislature created a State board to enlist and equip 30,000 men. Eighty-two companies were accepted in one week. The first volunteer regiment left the State 29 April and the last 12 July. Governor Morgan who had been commissioned major general, was placed in command of a separate military department of the United States constituting the State of New York. During the four years of war, New York furnished 448,850 men, or one sixth of the total. This proportion holds good in the total losses and casualties. For organizing, uniforming, equipping, substituting and transporting troops, the State expended \$3,745,554.98, for bounties \$50,657,406, for relief \$500,773; or in aggregate, all things considered in the way of official outlay on the authority of the State, \$57,569,082.56. The sentiment of New York State placed the responsibility for the war upon the Democratic party, although at the outbreak, thousands upon thousands of Democrats who had stood shoulder to shoulder with the political fire-eaters of the South, joined the Republican ranks, a very large proportion obtaining commissions as officers in the army of volunteers which had been hurriedly thrown together. The succession of Union disasters, however, and the declaration of the Emancipation Proclamation by President Lincoln, had created a feeling of distrust, uncertainty and doubt, which led in 1862 to the overthrow of the Republican party and the election of Horatio Seymour as governor over General James S. Wadsworth, an estimable gentleman and valiant soldier. The rebuke administered was not so much in the nature of a protest against the war as it was a protest against the conduct of the war. The success of the Democrats led to a marked decrease in the number of enlistments, which forced the national government to resort to the expedient of drafts. The demagogical utterances of Governor Seymour had led the reckless and lawless throughout the State to believe his hostility to the conduct of the war included protection for them in the commission of criminal acts. Unprotected by the transfer of its local militia to Pennsylvania after the battle of Gettysburg, New York city was now exposed for several days to mob law in the enforcement of the drafting, unequalled in the history of the country. Governor Seymour directly repaired to the metropolis, began a conciliatory speech by addressing the mob as "my friends," but eventually warned them by proclamation. The insurrection was only subdued by the return of the local military organizations.

Governor Reuben E. Fenton succeeded Governor Seymour in 1864, having been elected on the same ticket which returned Abraham Lincoln to the White House for his second term as President of the Nation. With the return of peace the country was confronted with the difficult problem of assimilating the hundreds of

thousands of soldiers who were now seeking employment in civil life and ordinary avocations. One of the first propositions considered by the people during the second term of Governor Fenton, was the agitation for the convention to revise the constitution, which culminated in the Constitutional Convention of 1867 that assembled at Albany on 4 June. The Honorable William A. Wheeler of Malone, afterward vice-president of the United States, was president of the convention which ended its labors on 28 Feb. 1868. The new constitution was adopted in the convention by a strict party vote. It introduced several original propositions. The legislature was reorganized, restrictions were imposed upon the exercise of legislative powers; the veto power of the governor was strengthened; a court of claims was created and the judiciary system was modified. The legislature of 1868 failed to pass an act to submit the proposed constitution to the people; as a result of the general election held in that year, the power of the State was transferred from Republican to Democratic hands. John T. Hoffman of New York was elected governor, largely due, it was claimed at the time, by flagitious debauchery of the ballot boxes in New York city by the Tweed ring which succeeded in carrying the State for the Democratic candidate for President, Horatio Seymour, by 10,000. From this year the vote of the city of New York in State politics was recognized as a powerful factor. Governor Hoffman was called "the veto governor" because of the unprecedented exercise of the veto power. During his four years in office, he vetoed 495 bills, only two of which subsequently became laws. He established the precedent of fling his reason in writing with bills he declined to sign at the end of the legislative session. The Tweed ring during his reign attained the height of its power. For audacity and rapacity the methods of the Tweed ring were unequalled, but it was soon brought to grief through the disclosures of the *New York Times*. In the meantime it had succeeded in re-electing its favorite candidate, John T. Hoffman, who at the close of his office retired to private life. As a consequence of the operations of this ring, two supreme court judges, George G. Barnard and Albert Cardozo and one superior court judge, John H. McCunn, were ordered to be impeached. Barnard was convicted and removed from office; Cardozo resigned and dodged his trial; McCunn was removed and shortly after died of a broken heart. While the exposé of the Tweed ring demoralized the Democrats, the Republicans were more or less torn by the dissensions in their own ranks on national affairs. An agitation for the revision of the constitution had been general throughout the State for several years, had been advocated by Governor Hoffman and was now recommended by Governor Dix, who in his message called attention to the misuse of sinking funds and to the abuse of the appropriations by the legislature for private charities. The State was suffering from the oppressive financial weights that had been imposed by the War of the Rebellion and from the reckless extravagance that had become a part of the body politic. A constitutional commission undertook to curb the expenditures and the squandering of public moneys. Samuel J. Tilden, who defeated General John A. Dix for

NEW YORK

governor in 1874, and who had been actively instrumental in prosecuting the Tweed ring, carefully scrutinized the heavy expenditures that had been made on the canals, and advocated rigid retrenchment. The effect of the financial disasters of 1873 had fallen heavily upon the people of the State. In the winter of 1875 canal boatmen, owners and forwarders petitioned the governor for relief, urging a further reduction of tolls. On 18 March 1875, the governor sent a special message to the Legislature arraigning the management of the canals. A commission was appointed to investigate the system. Twelve special reports were made to the governor, disclosing a long line of abuses and calling for the prosecution and punishment of recreant public officers.

Lucius Robinson was elected governor in 1876. He followed the efforts of his predecessor to curb extravagant outlays upon charitable institutions, urged economy in all public expenditures and used the veto power fearlessly. Governor Robinson was defeated in 1879. Alonzo B. Cornell, Republican, was the successful candidate. But for several years the Republican party, although successful in the presidential election in 1880, was demoralized by the fierce struggle between the Stalwarts and Half-breeds, consequent upon President Garfield's repudiation of Senators Conkling and Platt in the matter of making Federal appointments in the city and State of New York. The assassination of President Garfield, the accession of Vice-President Arthur, the defeat for governor in 1882 of Charles J. Folger, the defeat for nomination to the Presidency of General Arthur, and the election of Grover Cleveland for governor in 1882 and as President in 1884, all resulted from this bitter and unrelenting partisan warfare.

David B. Hill succeeded, as governor, Grover Cleveland, elected President, and held office from January 1885 to January 1892. During these years the first practical step for the creation of an Adirondack State Preserve was taken; the Niagara Falls Reservation was created; use of electricity in death sentences established; and State Board of Arbitration created.

In 1894 very radical modifications were made in the constitution by a convention which assembled in Albany, 8 May and adjourned in September. The new constitution was adopted by the people 6 November.

Governor Hill's successors in the gubernatorial chair were Roswell P. Flower, Levi P. Morton, Frank S. Black, Theodore Roosevelt, Benjamin B. Odell, Jr., Frank W. Higgins, Charles E. Hughes, Horace White and John A. Dix.

Leading Legislation.—1892-96. Roswell P. Flower, Governor. Features of legislation were the establishment of the Adirondack Park; ordering a convention to amend and revise the constitution; the prohibition of pool-selling in poolrooms; the excise laws were finally codified; and the question of a Greater New York was ordered to be submitted to a public vote.

1895-96. Levi P. Morton, Governor. The Governor's term of office now becomes two years, instead of three. The two principal features of Governor Morton's administration were the enactment of the "Raines Law"—a high-license measure aimed at reducing the number of saloons and removing them from political influence; and the passage of the

"Greater New York" bill, consolidating the local governments of the city and county of New York, the counties of Kings and Richmond and part of the county of Queens, giving the new metropolis an area of 359 square miles.

1897-98. Frank S. Black, Governor. The charter of "Greater New York" received the signature of Governor Black and its provisions went into effect 1 Jan. 1898. Important canal legislation and the appointment of a commission to investigate the expenditure of canal funds were features of this administration.

1899-1900. Theodore Roosevelt, Governor. Some insurance legislation is accomplished, especially as to the maintenance of a reserve fund; the "Maret Inquiry" was held, regarding alleged levies for corrupting legislation; and a committee previously appointed to report on a more equitable distribution of taxation recommended important changes in the tax laws.

1901-04. Benjamin B. Odell, Jr., Governor (two terms). "Palisades Park" was created, the New York Legislature acting in conjunction with that of New Jersey; Stony Point Park was purchased and dedicated; much valuable "Greater New York" charter revision was accomplished; a new terminal house act was passed, introducing a number of radical changes; and drastic provisions were passed looking to the suppression of anarchy.

1905-06. Frank W. Higgins, Governor. This administration was chiefly notable for the preliminary insurance investigations and initiatory discussion of direct primary and direct nomination legislation.

1907-10. Charles E. Hughes, Governor (two terms, but the last incomplete by his resignation in October 1910 to accept the office of Justice of the Supreme Court of the United States. Horace White, Lieutenant-Governor, filled out the rest of the term). The administration of Governor Hughes was the most important of any since the war. His first act was an attempt to remove Otto Kelsey, the State Superintendent of Insurance, for inefficiency, which the Senate refused to ratify, and Mr. Kelsey refused to resign. A bill for making the salaries of women teachers equal to that of men in the same grade was vetoed. A Public Utilities Act was passed, bringing all common carriers, light companies, and other public service corporations under the jurisdiction of two commissions. In an extraordinary session of the Legislature in the early summer of 1908 a law was passed prohibiting gambling at race tracks. A long continued struggle was carried on through the latter part of his administration to secure the enactment of some form of direct primaries bill, a special session of the Legislature even being called in June 1910, but without direct result, the Cobb bill, a compromise, failing of passage by only one vote. A progressive inheritance tax law was enacted which will prove very remunerative to the State.

1911-12. John A. Dix, Governor. The most important legislation of his first year's administration was the passage of a compromise election bill that provides for direct primaries in all but the State offices, which are still left to a convention.

HUGH HASTINGS,
Formerly State Historian.

New York, N. Y., first city in the State and in the United States; situated on the shores of the Hudson and North Rivers and of Long Island Sound and the Atlantic. The city originally began at the lower end of Manhattan Island, and has spread mainly north and east having an area of about 327 square miles. The borough of Manhattan, the business centre of the city, is laid out above 14th street in rectangular streets and avenues. The chief retail business streets are Broadway, Sixth avenue, Fifth avenue, and the Bowery, running north and northwest, and 14th, 23d, and 42d streets, running east and west across the island. Fifth and Madison avenues have been for many years the finest residence streets, but these are now giving way to Riverside and West End avenues, noble thoroughfares overlooking the Hudson and set with large separate mansions. Wall and Broad streets, where centre the financial interests of the city and the nation, are short streets lying east of Broadway and near the southern end of the island.

Municipal Service and Improvements.—The streets of New York have a total length of over 2,500 miles, most of which are paved; and it cost in 1909 \$7,418,299 to clean and sprinkle them, and over \$3,000,000 to light them. The total length of the city's sewers is 1,557 miles, and the annual cost of removing the garbage and ashes is \$2,511,789. The city supports public free floating baths on the East and North Rivers during the summer months. There is also free interior permanent baths. All these things help to keep the city death rate down to about 19.06 in 1,000. The city owns its own water-works, including some 2,000 miles of mains, costing about \$125,000,000 and have a total capacity of 544,654,000 gallons, one third more than the average daily consumption. The present water supply of Manhattan is received from the Croton watershed, 30 miles north of the borough. The new Catskill aqueduct now being built will have a capacity of 700,000,000 gallons a day, and the largest reservoir in the system (the Ashokan) once filled could supply the city for 235 days at the present rate of consumption without any water flowing into it. The entire cost of this gigantic undertaking, including watersheds, reservoirs, tunnels, etc., is estimated at \$186,857,000 and it is expected to complete the work in 1915. The police department numbers over 9,000 men, besides harbor patrol steamers; and its cost in 1909 was \$14,160,201. The fire department has a total uniformed force of 4,307 men, and its cost in 1909 was \$8,030,565. The street railways of the city, operated mainly by electricity, cover 1,232 miles of line, and represent an outlay for

construction and equipment of \$250,000,000. The new subway is 23.5 miles long.

Public Parks.—The park system of the entire city covers 7,162.37 acres; that of the boroughs of Manhattan, Richmond, and the Bronx 5,406.7 acres. The largest park in Manhattan is Central Park, covering an area of 843 acres, and representing a cost of \$15,000,000. It extends from 50th street to 110th street. In the southwest corner is the playground and carousel for children, and beyond the common lawn of 16 acres. The menagerie is in the southeast part. The mall is a broad parade a quarter of a mile long, bordered by double rows of elm trees and famous for its collection of statues. The terrace, a pile of richly carved masonry, and the lake, come next in view, and beyond the lake is the ramble of 36 acres. Farther on is the Belvedere, a tower of stone, and next are the city reservoirs. On the left is the American Museum of Natural History (q.v.). Opposite the Obelisk and near Fifth avenue and 83d street is the Metropolitan Museum of Art (q.v.). The largest park in the Bronx is Bronx Park, in the central northern section of the borough. The northwestern section of 250 acres has been assigned to the Botanical Society, whose gardens are free to the public at all times. The southeastern section of the park comprising 261 acres is in charge of the Zoological Society, and its buildings, cages and ranges are free to the public except on Mondays and Thursdays. Prospect Park, Brooklyn, contains 526 acres.

Chief Buildings.—First among the buildings of the city devoted to official or public purposes, taking them in the order of their distribution, is the City Aquarium in Battery Park, popularly known as Castle Garden. Originally a fort, this structure later became a public assembly room, and after that for 35 years served as a landing place for immigrants, during which time nearly 10,000,000 immigrants passed through its portals. Since December, 1896, it has been used as an aquarium. The new Customs House, just completed at the foot of Broadway on the original site of Fort Amsterdam, cost \$10,000,000. The structure at the corner of Wall and Nassau streets, built by the general government in 1814, was first used as a customs-house, but has been the home since 1863 of the sub-treasury. A handsome building at 65 Liberty street, the site of which cost \$1,000,000, houses the Chamber of Commerce organized 5 May 1768, in Fraunces' Tavern (still standing at Broad and Pearl streets), and for more than a century the most powerful unit of force in the financial and commercial affairs of the city. A structure of great architectural beauty near the head of Broad street has been the home since the opening in 1903 of the New York Stock Exchange, which, organized on 17 May 1792, has been for many years the financial centre of the continent. The Postoffice building at the lower end of City Hall Park was erected in 1875, and its imposing dimensions bear witness to the wonderful growth of a city whose mail less than 100 years ago was handled by one man. A little to the north of it are the city-hall, completed in 1811, the city courts, Hall of Records, and city prison. Cooper Union at the junction of Third and Fourth avenues houses Cooper Institute, founded by Peter Cooper, for 'the instruction of the people of the United States in practical science and art.'

NEW YORK

The Institute has an endowment of upward of \$2,000,000 and has given instruction to thousands of pupils. Mention must also be made of the Metropolitan Museum of Art in Central Park, which houses the finest art collection in America and has an ample endowment for future purchases; the Metropolitan Opera House, the Manhattan Opera House, the New Theatre, the Singer Building, the Woolworth Building (51 stories), and the Metropolitan Building, with its unique tower and chimes, the New York Public Library, the Pennsylvania Railroad Station, just completed, Madison Square Garden (q.v.), one of the most spacious places of public assemblage in the Western World, and of the building given in 1900 to New York University for a Hall of Fame.

Population.—The census of 1910 gave New York a population of 4,766,883. The area comprised within the present limits of New York city had a population of 49,401 in 1790, which has grown to 696,115 in 1850, an increase of 1,309 per cent. The population of the present city has grown to 2,331,542, an increase since 1850 of over 300 per cent. Between 1900 and 1910 there was an increase of 1,329,681, or 26 per cent. The present population is the most remarkable collection of people in the world, the most various in race and religion ever gathered together in such numbers in the history of mankind. In 1900 only 21.5 per cent of the population were native whites of native parentage, and on Manhattan Island only 16.9 per cent or about one sixth. Since the 1900 census was taken even these small percentages have diminished, for immigration has been in unprecedentedly great volume, and the birth rate is highest in the districts of the city where the population of alien birth is largest. Even of the native population of native parentage, 737,477 in number, nearly one fifth were born outside of the State of New York. The great feature of the city's population, however, is its immediate foreign derivation. Almost every race on the globe is represented in its population.

Government.—The charter of New York, as revised by the Legislature of 1901, follows, in the main, the lines of the charter of the old city, with important provisions adopted from the charter of the former city of Brooklyn, and from those of other American and European cities. The greater part of it is the law as it has existed for half a century, and the chief changes have to do with the adoption of the borough system and the system of giving control to localities over their own affairs. The executive power is vested in the mayor, the presidents of the boroughs and the heads of the departments. The mayor, who holds office for four years and is eligible for re-election, appoints the heads of departments and commissioners, except those over which the presidents of the boroughs have jurisdiction, and except also the comptroller or head of the department of finance who is elected by the people. He can, with few exceptions, remove any official appointed by him, and can himself be removed by the governor, after a hearing upon charges. The mayor has the power of veto over all ordinances and resolutions of the Board of Aldermen, but an ordinance or resolution can be passed over his veto by a vote of two thirds of the members of that body, except that when it involves the expenditure of money, the creation of a debt or the lay-

ing of an assessment, a three fourths vote is required. The president of each borough holds office for two years. He presides over each local board in his borough, with the right to vote on and of veto over its actions, and is an ex-officio member of the board of estimate and apportionment. He is also a member of the Board of Aldermen and has the same right to vote as any member elected to that body. The borough president appoints and may at pleasure remove a commissioner of public works for his borough with control of all matters relating to the improvement and repair of streets and sewers. He also has control of the public buildings in his borough except schools, hospitals, penitentiaries and fire and police stations, and exercises the supervision vested in the city over the construction of buildings in his borough, except such powers as are directly vested in the Tenement House Commission. In 1908 a new charter was drawn up for New York City, by order of Governor Hughes, containing several modifications from the older document. Among the principal changes proposed are (1) the reduction of defective administrative offices, (2) separation of appropriating and spending powers, (3) greater concentration of responsibility, (4) abolition of Board of Aldermen. No action has yet been taken upon this charter.

Libraries.—The chief library of the city is the New York Public Library—Astor, Lenox and Tilden Foundations, established in 1805 by consolidation of the Astor and Lenox libraries and the Tilden Trust. The Astor was founded in 1840 by John Jacob Astor, and the Lenox in 1870 by James Lenox. The Tilden Trust was created in 1884 by the will of Samuel J. Tilden, and at the end, by compromise, of a legal contest, became possessed of \$1,000,000. The consolidated library has an invested endowment of \$4,500,000. It contains 736,000 bound volumes and 220,000 pamphlets, and is eventually to be housed in a building in Bryant Park which will cost \$2,800,000. The Carnegie endowment, announced in 1901, provides for 50 branch library buildings which will cost over \$3,000,000, many of which are already completed. Besides the Public Library, there are many institutional, private and special libraries, the chief being that of Columbia University, with 310,000 volumes; others are the library of the New York Historical Society of 100,000 volumes; the Society Library of 100,000 volumes, and the Mercantile Library of 233,000 volumes.

Education and Intellectual Associations.—The city has about 500 schools, free and wholly supported by taxation at a cost of more than \$35,000,000—the largest sum spent for public education by any community in the world. Five eighths of the annual outlay represents the salaries of over 13,000 teachers, who give instruction to more than 600,000 pupils. Evening schools cost about \$700,000 a year, and vacation schools and play grounds more than \$300,000. First among the city's higher institutions of learning are Columbia University, founded in 1754, with 600 instructors and 5,000 students; the College of the City of New York, established in 1848, with 120 instructors and 2,100 pupils; the New York University, with 369 instructors and 4,175 students; the College of Physicians and Surgeons; the College of St. Francis Xavier, and St. John's College, conducted by the Jesuits; the General Theological Seminary of the Prot-

stant Episcopal Church; Manhattan College; the Conservatory of Music; the New York Law School, the Normal College, and the Union Theological Seminary. A majority of the hospitals have training schools for nurses. There are many art and literary associations, chief among them the New York Historical Society and the National Academy of Design; and over 100 dramatic and musical clubs, about 200 social clubs and as many theatres.

Charities.—First among the charitable institutions of the city is the Charity Organization Society, which is supported by voluntary contributions and legacies and serves as a centre of inter-communication between various churches and charitable agencies. There are 28 hospitals, refuges and asylums which receive government or official aid, and about 100 hospitals and dispensaries supported by voluntary contributions and private endowment. Twenty-nine institutions and associations are conducted for the relief of the aged, and 122 for the relief of children. In the latter class mention should be made of the Children's Aid Society, organized in 1853, which has provided 75,000 boys and girls with homes and places of employment, and in its industrial schools given aid and instruction to over 115,000 children; the New York Foundling Hospital, which is controlled by the Sisters of Charity and contains 4,300 inmates, and the Society for the Prevention of Cruelty to Children, by which an average of 9,000 complaints are yearly received and investigated. There are 26 organized agencies for the reformation of children, fallen women and intemperate men; these include the Catholic Protectors, where 4,500 children are taught trades and industrial employment, and the House of Refuge, where 1,300 boys and girls, received upon commitment of the city courts, are given a common school education and industrial instruction. Noteworthy among agencies for rendering special or temporary relief to the poor are the Grace Institute, endowed by William R. Grace in 1897 to furnish women and girls instruction in trades and occupations and which now has 900 pupils; the Legal Aid Society, which gives free legal aid and assistance to those unable to procure the same; the Prison Association of New York, which aids reformed convicts after discharge; the Provident Loan Society, which loans on pledges of personal property at one per cent a month; the Baron de Hirsch Fund for the benefit of Hebrew immigrants; 15 Church and College Settlement Houses; and the Sailor's Snug Harbor on Staten Island, where a home is provided for 900 aged and decrepit sailors. Mention must also be made of the Society for the Prevention of Cruelty to Animals, founded in 1864 by Henry Bergh, and the parent of similar organizations in many other States and cities.

Churches.—New York is the seat of a Roman Catholic and of an Episcopal archbishop. There are in the city, exclusive of Brooklyn, about 800 churches and religious societies. The Roman Catholics have more than 150 churches, the Episcopalians 120, and the Methodist Episcopal more than 100. The Presbyterians, Baptists, Lutherans, Reformed and Congregational bodies combined have more than 300 churches. And the Disciples of Christ, Moravians, Universalists, Unitarians, Friends and Christian Scientists each have a number of fine churches,

while the Jewish synagogues number 120. There are also many independent organizations representing every kind of religious belief. The value of church property in the city, exclusive of Brooklyn, is about \$1,000,000,000. The finest church building is the Roman Catholic cathedral in Fifth Avenue. Of the others the most notable is Trinity Church in Broadway at the head of Wall Street, which has the longest continuous history of any parish in the city. It was in 1697 that William and Mary granted a parcel of land "in or near to a street without the north gate of the city, commonly called Broadway," for use "as the parish church and church-yard of the parish of Trinity Church within our said city of New York." The church built on this grant was occupied in 1698. Destroyed in the fire of 1776, the church was rebuilt two years later on the original site; but the second building was found to be unsafe in 1832, and in 1846 was replaced by the present structure. The new Protestant Episcopal cathedral of St. John the Divine, located on Morningside Heights, now partially completed and opened for worship in part, will be when completed the costliest church edifice in America.

Finances and Banking.—The assessed valuation of property within the city for the year 1910 was \$7,250,500,550, the most of it being real estate. The net bonded debt of the city is \$730,166,282. The city expenses are \$97,119,031 a year, the tax rate 2.273 per cent, and the city owns property valued at more than \$350,000,000. There are 422 banks of discount (53 national), 49 savings banks, 49 trust companies and 133 building and loan associations. The total stock of the 37 national and 17 state banks which are members of the Clearing House Association is \$109,822,700, and their undivided profits \$129,257,100—a total of \$239,079,800 actual capital invested in these 46 institutions. The trust companies of New York own about \$200,000,000 of stocks and bonds; the state banks recently owned nearly \$10,000,000, and the national banks (exclusive of bonds held to secure circulation and United States deposits) owned over \$100,000,000—a total of more than \$300,000,000 in securities owned by the banks and trust companies of the city. Two notable developments in the New York banking world in recent years have been a great increase in bank capitalization leading to the creation of \$25,000,000 and \$10,000,000 banks, and the establishment of powerful chains of banks and trust companies—that is to say, the close affiliation by ties of common ownership, of a number of large credit institutions, so that it may be said that six or seven such chains now constitute the money power of New York. The largest of the city's savings banks is the Bowery Savings Bank, which in 1911 had upward of 128,000 accounts open with a total amount deposited of \$102,450,000. There are 36 fire and marine and 5 life insurance companies in the city. The best known of the city's financial institutions is the Stock Exchange, an association for the exchange of securities for currency or its representatives. The securities bought and sold at the New York Stock Exchange are certificates of stocks, and bonds issued under national, state, or municipal authority, or by corporations doing business as common carriers, or in banking, mining, manufacturing, or other

NEW YORK

industrial pursuits. The cash value of the annual transactions in this national monetary institution defies ordinary comprehension. The chief business of its members is buying and selling these stocks and bonds for outside clients and so great is the demand for their services that an average of \$200,000 a day or \$70,000,000 a year is distributed among them in commissions—the charge being one eighth of one per cent on the par value of every transaction. The Stock Exchange is limited to a membership of 1,200, and all new members are now admitted through transfer, "seats" being worth from \$65,000 to \$75,000.

Trade and Commerce.—Nature and man have made New York the main portal of the foreign commerce of the United States. Manhattan Island has over nine miles of docks, but this is not the limit of the city's capacity. Miles of the Hudson River front on the New Jersey side are owned by the great railroad corporations, whose terminals afford docks for the reception of freight and passengers. Across the East River are the docks of sugar refineries, factories, warehouses, government storage houses, and great basins for canal boats, while of late years the shores of Staten Island have been hidden by the growth of docks. The total tonnage of the over-sea vessels entering and leaving the port of New York in 1908 was 24,094,744, and if the figures of its coastal are included with those of its deep-sea trade, New York is to-day the leading seaport of the world. Its total import trade is now over \$688,000,000 a year, or 55 per cent of the imports of the whole country, and its total export trade more than \$700,000,000, or three fifths of the exports from all the ports of the United States. There are owned in New York over 4,000 vessels of all classes, with a total tonnage of about 1,250,000. More than 150 steamship and steamboat lines run from New York to points on the coast, sound, and river, and to ports in Central and South America, Europe, Africa, Asia, and Australia. As to the railroads, it is the terminal of the main line of the Central Railroad of New Jersey, the Pennsylvania, the New York Central, the Erie, the New York, New Haven & Hartford, the West Shore, the Delaware, Lackawanna & Western, the New York, Lake Erie & Western, the Long Island, and the New York, Ontario & Western. The New York Central is now making terminal improvements which will cost \$25,000,000, while of even greater importance is the Pennsylvania tunnel just completed under the Hudson and East rivers and the boroughs of Manhattan and Queens, opened 8 Sept. 1910, representing nearly half a century of thought and costing, with all incidental improvements, about \$160,000,000. This will afford continuous track connection between the Pennsylvania and Long Island railroads, with a central station in the borough of Manhattan, and a terminal emergence of the tunnel system at a point near Thompson Avenue, Long Island City. The plans for this improvement, devised by Charles M. Jacobs, involved five tubes, each 18 feet 6 inches inside diameter. Three of these tubes are 100 feet below high tide under the Hudson River, and two under the East River, each tube holding a single track. The tunnel system converges at a central station located in Manhattan. The station structure, designed after the Quai d'Orsay in Paris,

but twice as large, is 1,500 feet in length by 500 feet in width, and enclose 25 tracks at tunnel level, which are approached by gradual carriage drive and walk ways. The tunnel tubes are laid below 31st street in Manhattan, and underneath Long Island City in Queens. The entire length of the tunnel system is 15 miles, and its cost \$50,000,000.

Manufactures.—New York is a great manufacturing as well as trading city. There are at the present time about 550,000 people employed in manufacturing industries in the city, in over 25,938 establishments. These establishments represent an invested capital of over \$1,000,000,000 and each year pay upward of \$210,000,000 in wages. The annual cost of the materials used by them is \$1,692,155,000, and the value of their finished product about \$2,000,000,000. The principal industries, aside from food, tinmithing, and mason, carpenter and structural iron work, are the manufacture of sugar, tobacco, and clothing; of brass and copper, chemicals, patent medicines and compounds, clocks, watches, and musical instruments; of rope and cordage, products of iron and steel, boats and sails, glass and glassware, arms and ammunition, india rubber and leather products; of instruments for scientific purposes, gold and silver ware, malt liquors and distilled spirits, paper, oils, paints, pigments and colors; products of cotton, wool, and wood, and of soap, starch, and matches. Mention must also be made of fine printing, lithographing, engraving and map making in which New York holds first place in America. All told the industries conducted in the city number more than 1,000, and the rate of increase recently has averaged 16 per cent a year.

History.—The first white men known to have visited Manhattan Island, the future site of New York city, were Giovanni da Verrazano, an Italian sailing in the French service, and Diego Gomez, a Portuguese sailing in the Spanish service, both of whom, while seeking a westerly way to the Indies in 1524, entered what is now the harbor of New York. Nothing, however, in the way of colonization came of their voyage. Eighty-five years later, in April 1609, Henry Hudson, an English adventurer in the service of the Dutch East India Company, sailed from Amsterdam as captain of the ship Half Moon, with a charge from his employers to seek a water route to the Indies by the north side of Nova Zembla. Ice early blocked his advance into the Arctic, and so, heading westward, a month's cruise brought him, in July, to the coast of Newfoundland. Thence he sailed southward to the James River, Virginia, and, again altering his course, still in pursuit of a new channel to India, came on 11 Sept. 1609 upon the river which bears his name. He anchored for a time at its mouth and then sailed up the stream until warned by shoaling water that he was at the head of navigation, near the present site of Albany; whereupon he turned his vessel southward, and early in October set out on his homeward voyage. Hudson's account of the stores of fine peltries he had seen in the possession of the Indians moved his employers to prompt action, and in 1609 the former mate of the Half Moon was sent across to trade with the savages and report further upon the country. Handsome profits attended this venture, and so

1613 the *Fortune* and the *Tiger*, commanded respectively by Hendrick Christaensen and Adrian Block, sailed for the Hudson River, being followed within a year by three other vessels from Amsterdam and Hoven. These carried back to Holland such generous cargoes of furs that their owners hastened to open regular communication with the Hudson River country and to establish posts at its head and at its mouth for the purchase and collection of skins while the vessels were on their voyages to and from Holland. The main post, called Fort Nassau, was located just below the site of Albany; but a smaller fort was built on Manhattan Island, its site being just south of the present Bowling Green. Captain Christaensen was appointed head man over both posts, and he and his half dozen comrades were, therefore, the first white settlers on Manhattan Island. Though Christaensen soon lost his life in a quarrel with the Indians, the trade he had helped to found grew and prospered, and soon the merchants who had first engaged in it joined with others in the formation of the United New Netherlands Company, to which, so far as the power lay with the States-General of Holland, was granted for three years from 1615 the monopoly of the fur trade with the newly opened country. This monopoly was renewed for a year at a time until 1621, when the Dutch West India Company came into existence with chartered rights to the exclusive trade of all the coasts of both Americas. The new corporation was, speaking in a broad way, a commercial federation, with branches established in the several cities of Holland. Each branch, though subject to the collective authority of its fellows, was clothed with distinct rights and privileges of its own, and was assigned a specific territory, over which it exercised the right of government and of trade. Thus, the post on Manhattan Island, with its dependent territory, was assigned to the Amsterdam branch, which at once addressed itself to the development of what had now come to be known as the Province of New Netherlands. Accordingly in 1623 thirty families of settlers were sent out from Amsterdam, and a part of them put ashore on Manhattan Island. More colonists arrived in 1625, men who had come as homemakers, and not as transient traders; and to confirm this promise of permanency Peter Minuit was appointed director-general of the colony, with power to organize a provisional government. He arrived at his post in May 1626, at the head of another band of colonists, and having bought Manhattan Island from its Indian owners for a consideration of \$24 he proceeded to christen the infant town New Amsterdam. Recalled from his directorship in 1632, Minuit was succeeded in turn by Wouter van Twiller, William Kieft and Peter Stuyvesant. A savage Indian war in Kieft's time well nigh extinguished the colony, but it made rapid recovery under Stuyvesant, who directed its affairs from 1647 to 1664, and by the year last named the hamlet on Manhattan Island has become a town of 1,000 souls, under the government, organized in 1652, of a schout, two burgomasters and five schepens, while thriving settlements had sprung up on both sides of the Hudson and on the lands about the Bay.

The Dutch, however, did not long retain possession of New Netherlands. The English claimed the entire continent as having been dis-

covered by Cabot, and whenever the English and the Dutch were at war New Amsterdam had always to fear the threatened attack of some English squadron. The dreaded blow finally fell in 1664, when Charles II. resolved to seize New Netherlands by surprise. In pursuit of this purpose the king made to his brother James, Duke of York and Albany, a grant which included the whole of the Dutch possessions in America, and late in August 1664 a British squadron appeared before New Amsterdam and demanded its surrender. The coming of the English found the town ill-prepared for a siege, and though Stuyvesant wished to fight, even against heavy odds, he was not allowed to have his way. Articles of capitulation were quickly agreed upon, and on 8 September the flag of the West India Company fell from Fort Amsterdam to be replaced by that of England, and Colonel Richard Nicolls took possession of the town and province in the name of the English king and for the use of the Duke of York.

New Amsterdam was speedily renamed New York, and in June 1665 the city government was reorganized, in accordance with English customs, by replacing the schout, burgomasters, and schepens with a sheriff, aldermen, and mayor. Once again, from 30 July 1673 until 20 Nov 1674, the Dutch were in possession of the town and province; but the treaty of Westminster finally transferred them from the States-General to England; and the permanent change of ownership was attended by a change of policy which made for the more rapid upbuilding of the town. One important act looking to this end bestowed on New York the sole right to bolt and export flour. The Bolting Act remained in force from 1678 until 1694, and during that time it trebled the population of the town, and gave a prosperous permanency to its foreign commerce. According to the provisions of the act no person outside of the city could grind flour for market or pack breadstuffs in any form for sale. The result of this interdict was to throw the considerable and growing export trade in breadstuffs, mainly with the West Indies, wholly in the hands of the millers and merchants of New York, so that during the sixteen years that the act remained operative the city revenues more than doubled and the total number of buildings in the town increased from 384 to 983, two thirds of which depended in one way or another on the trade in flour, while the port's sailing craft grew from 11 to 85 sloops and ships.

It was while the Bolting Act was still in force that, on 22 April 1686, New York received the charter,—known as the Dongan charter, because granted through the governor of that name,—which still forms the basis of its civic rights. The governor, under this instrument, appointed the mayor and sheriff, but the city was allowed a large quantity of real estate, from some of which it draws a revenue to the present day, while the aldermen were elected by the freeholders of the six wards into which the town had been recently divided, and enacted by laws for its government. The Dongan charter, amended by Queen Anne in 1708, was further enlarged by George II., in 1730, into the Montgomery charter, which, confirmed by the assembly of the province in 1732, made New York virtually a free city. The mayor until the Revolution was appointed by the governor

NEW YORK

in council, until 1821 by the governor of the State and four members of the council of appointment, and then for thirteen years by the common council of the city. Since 1834 he has been chosen by the people.

The revolution by which, in April 1689, the crown of England passed from James II. to his daughter and her husband, bred a popular uprising in New York, and control of affairs passed for the time being from the crown officers to a Committee of Safety of ten members, chosen by the citizens. This committee appointed Jacob Leisler, a leading merchant, captain of the fort, and invested him with the power of commander-in-chief until orders should arrive from the new sovereigns. This arrangement was opposed by the so-called Aristocratic party, whose leaders had been office-holders under King James, but without effect, and the government of the town and province remained in the hands of Leisler until March 1691, when Colonel Henry Sloughter, who had been appointed governor of the Colony by William and Mary, arrived in New York. Leisler declined to surrender the fort unless assured immunity for his acts as governor. This was refused by Sloughter, who had fallen under the empire of the Aristocratic party, many of Leisler's followers deserted him, and he was thrown into prison. A little later, with his son-in-law Jacob Milborne and other of his adherents, he was brought to trial charged with treason and murder. All were found guilty by a prejudiced and hostile court, and Leisler and Milborne suffered death on the gallows. Their execution was little less than a judicial murder. Leisler's son afterward secured an order for the restoration of his confiscated estate, and, in 1698, an act was passed by the Parliament of England which canceled the judgments of the court in New York and sustained Leisler's course as governor. Three years afterward the bodies of Leisler and Milborne, denied funeral honors at the time of execution, were taken from their temporary resting place, near the present site of the Sun building, and, after lying in state in the City Hall, were with impressive ceremony reinterred in a burial-ground which stood in what is now Exchange Place. No man knows their present sepulture.

The political turmoils of the period did not retard the growth of New York, and the opening of the 18th century found the town's population increased to 5,000 souls,—Dutch and English nearly equal in numbers; a few French, Swedes, and Jews, and about 800 negroes, nearly all of whom were slaves. Slave importation into New York began some time prior to 1668, and reached a climax about 1746, when a census of the town showed 2,400 slaves in a total of less than 12,000 population. Thereafter each year marked a lessening demand for slaves, though they continued to be bought and sold during the entire colonial period. One reason for the decline of slave-holding and slave-buying in New York was the dread of a servile insurrection, dread which led uprisings among the blacks to be punished with unsparing hand. When, in 1712, a party of negroes, forming a wild plot to slay all the whites, met at night in an orchard near Maiden Lane, and killed and wounded a dozen men before being put to flight, 21 of those captured were shot, hung or burned at the stake. Reprisals even more sweeping attended the "Great Negro Plot" of 1741, a

panic compounded of fear, rage and suspicion, which has been likened to the witchcraft delusion at Salem Village in 1692. This panic had its origin in a series of fires which in March 1741 alarmed the town, and fixed in the minds of many citizens the belief that they were the work of disaffected slaves.

A short time before the indentured servant-girl of a low tavern-keeper on the North River had been arrested, together with her master and mistress and two negroes, for complicity in a robbery. When a proclamation appeared offering a reward with a full pardon to any conspirator who would tell what he knew about a plot for burning the town, she saw in it a chance to regain her freedom, and "confessed" that her master and mistress, along with sundry blacks and semi-criminal whites, had matured such a plot as the first step in a projected uprising. It has ever since been doubted whether this plot was anything more than a figment of the imagination of a depraved and abandoned girl, but at the moment the creature's charges produced a reign of terror, and scores were jailed and put to death on little save her unsupported statements. Fourteen negroes were burned at the stake, 18 were hanged, and 71 transported, while of the 20 whites thrown into prison four were condemned and put to death. Glutted with victims, the panic finally subsided in September 1741, leaving behind it one of the darkest pages in the history of the city. It would be unjust, however, to judge this affair by the standards of a later time. Fear and terror, fed by fraud, appear to have prompted some awful mistakes, but those who committed them lived and acted under the hair-hung sword. The panic of 1741, moreover, was followed by a wholesome revulsion of popular feeling in favor of the negroes. They were admitted to the franchise within 10 years, and in 1758 the abolition of slavery in New York was practically accomplished by an act which declared that from that time forth all children born of slave parents should be free.

During the first part of the 18th century ocean industries were what mainly contributed to New York's growth and wealth. Kalm, the Swedish traveler, records that 211 vessels entered and 222 vessels cleared from this port in 1730, and the town's river, coast and sea trade grew steadily until the opening of the Revolution, when about one tenth of all the foreign commerce of the colonies was centred at New York. But with the arrival of the British army of occupation, 15 Sept. 1776, a seven years' blight settled over the town. During this period it lost more than half of its population and all of its commerce, and was twice visited by destructive fires. These laid a full fourth part of the town in ashes, nor was any attempt made to repair the devastation until after the British evacuation, 25 Nov. 1783. The war ended, however, the men of New York faced the future with stout hearts. "The town is ruined by the war, but its future greatness is unquestioned," wrote one of them; and in this hopeful spirit was begun the work of building anew—a work pushed with such resolute purpose that within eight years from the town's evacuation its population trebled and its commerce regained and passed its former limit. During this period also it was for a year and a half the capital of the Federal government, and in the Federal

NEW YORK

Hall in Wall Street, on 30 April 1789, Washington was inaugurated first President of the United States.

New York ceased to be the Federal capital in August 1790, but this did not retard its growth, and in 1807, by which time it had reached a population of 60,000, robust faith in its future prompted the appointment of a commission to plot the city south of 155th Street substantially as it exists to-day. The commissioners, however, had hardly begun their task, duly completed in 1811, when New York was made to suffer from the chain of events which led to and attended the second war with England. The act of embargo passed by Congress, in September 1807, dealt what seemed at the moment a mortal blow to the prosperity of the town; and John Lambert, the English traveler, writes that in April of the following year he found 500 vessels in its harbor lying up useless and rotting for want of employment, while the losses of the next six years bore more heavily upon New York than any other city. But with the conclusion of a treaty of peace in December 1814 the town's commerce revived on the instant, and the annual revenues of the port, which had fallen to but little more than \$500,000, shot up in 1815 to \$14,000,000.

The end of another two years brought the practical inception of an enterprise to which the modern city is largely indebted for its commercial supremacy,—the cutting of a waterway from the Hudson River to the Great Lakes. The Erie Canal, begun on 4 July 1817, and completed on 26 Oct. 1825, made New York the gateway to the commerce of half a continent; and so profoundly did this union of the inland and the outland seas affect its growth that the year 1835 found it a city of 200,000 souls. A fire in December 1835, which caused a money loss of upward of \$20,000,000, and the financial panic of 1837, were temporary checks to this growth, but only temporary ones. Gas was introduced into the city in 1825; the first street railway was set afoot in 1831, and in 1851, with the completion of the first trunk line to the Great Lakes, was inaugurated the railway service which has long made New York the seaboard terminus of all east and west lines. This was the Erie, begun in 1836, and extending from Piermont on the Hudson to Dunkirk on Lake Erie. Two years later the second trunk line connecting New York and the West, the New York Central & Hudson River Railroad, was established by the consolidation of a number of shorter lines. Several railroads had been built meanwhile in New Jersey, connecting New York with Philadelphia and other points. These in the process of time became one corporation, as the United Railroads of New Jersey, only to be in turn absorbed by the Pennsylvania Railroad, which after 1854 connected Philadelphia with Pittsburg, thereby not only perfecting New York's connection with the Middle and Southern States, but also sending from the heart of commerce an artery of traffic into the Middle Western States. The building of these and other lines, called, however, for the investment of large sums of money, from which quick returns were expected, and this bred a spirit of speculation whose blighting influence spared no part of the nation. The banks of New York suspended payment from October until December, trade and industry came to a standstill, and

there were 5,000 failures, with liabilities exceeding \$300,000,000. But confidence returned with the spring, and with it a resumption of railway construction, which, though temporarily retarded by the Civil War, has ever since tended in growing measure to strengthen New York's hold upon the business of the interior of the country. To-day ten trunk lines terminate in New York, which is also the objective point of a major portion of the traffic of all the railroads running east and west.

New York's devotion to the Union during the Civil War found expression in many ways. A sixth of its able-bodied male citizens were in the field before the close of the first year of the struggle, while from the first the women of the city busied themselves with efforts to care for the soldiers in camp and hospital and for their widows and orphans. They led in the founding of the Sanitary and Christian Commissions, and a single fair held in behalf of the former yielded more than \$1,000,000. A kindred organization ministered to the necessities of refugees from the South, and a Soldiers' Rest was established on the site of Madison Square Garden, where soldiers could find a temporary home while on their way to and from the front. But in no form did New York's devotion to the Union find more suffering expression than in the labors of the Union League Club, which, founded in the closing days of 1862 on the basis of "absolute and unqualified loyalty to the government, and unwavering support of its effort for the suppression of the rebellion," counted among its members every loyal citizen of note in the town; \$210,000,000 were subscribed by the bankers and capitalists of Manhattan to the loans made by the government between 1861 and 1865, and the major portion of this sum was furnished or secured by members of the Union League Club. There was but one blot on New York's story of splendid loyalty. Proof of the existence of a turbulent element in the population had been furnished in 1849 when some thousands of rioters, taking into their own hands a quarrel between Edwin Forrest and the English actor William Charles Macready, sought to drive the latter from the stage of the Astor Place Opera House, but were held in check by the police, fired into by the militia, and finally dispersed; and the same lawless spirit found expression in an outbreak yet more ferocious in July 1863. Congress had passed a draft law that unwisely exempted from its operation all who should pay into the Federal treasury the sum of \$300, and the discontent thus produced was systematically fomented in New York city by pot-house politicians, who in bar-rooms and on street corners declared the draft unconstitutional, and that it bore with peculiar oppressiveness on the poor man. Many vowed resistance, and, borrowing courage from the fact that the city, to beat back Lee's invasion of Pennsylvania, had been denuded of all but 300 troops, made plans to attack the drafting officers. No trouble occurred on the first day of the draft, 11 July, but on the third, 13 July, an organized mob attacked and wrecked the office of the provost-marshal at the corner of Third Avenue and 45th Street. Then the rioters, inspired by animosity toward the negro race, made a raid on a colored orphan asylum in Fifth Avenue, between 43d and 44th streets; and though a handful of policemen aided the nurses in getting the chil-

drove through a rear door to a place of safety, the building was burned to the ground. After this the mob attacked another enrolling office at 1190 Broadway, near 28th Street, with the resultant firing and pillage of most of the shops in the neighborhood. A cry now went up to kill the police, and soon 5,000 rioters, so rapidly had the mob swelled in numbers, were marching down Broadway, bent upon the destruction of police headquarters in Mulberry Street. Thomas C. Acton, president of the police board, informed of the rioters' purpose, detailed Sergeant Daniel Carpenter with 200 men to lie in wait for them. Carpenter marched his squad into Bleeker Street and so to Broadway, at the same time sending detachments up the nearest parallel streets east and west to strike the flanks of the oncoming mob. "Hit for their heads, men," were his orders. "Hit quick and hard, and take no prisoners." The fight that followed came soon to an end, and Broadway was cleared of rioters, save those that lay on the pavement with broken skulls. Routed at one point, however, the mob soon rallied at another, and a few hours later, under cover of darkness, a desperate attempt was made to sack and burn the office of the *Tribune* in Park Row. Here again the police did heroic service, and a charge led by Inspector George W. Dinks at the head of 110 men drove the rioters from the field with heavy loss in killed and wounded. Riotous feints meantime had been made upon the Seventh Avenue and Center Street arsenals and upon the armory at the corner of Second Avenue and 21st Street; the house of George Opdyke, mayor of the city, invaded and some of his furniture destroyed, and an attack made against that of Henry J. Raymond, editor of the *Times*, which had strongly supported the draft. It was clear at the close of Monday that the police force of the city was too small to cope with the lawless spirit. The mayor accordingly called on the State and Federal authorities for aid, and all of the New York regiments at the front were ordered to repair to the city. While this order was in process of execution the mob continued its work of firing and looting houses, and of maltreating and murdering unoffending negroes; but on the evening of Wednesday the returning regiments began to arrive in the city. With their coming, bayonets and bullets were substituted for policemen's clubs, and the rioters were attacked at every point with a resolute desire to do them harm. This wholesome policy, with a temporary suspension of the draft, quelled the rioting, and on Friday 17 July the mayor was able to announce the complete restoration of order. Two millions dollars' worth of property had been destroyed and over 1,200 rioters slain.

New York during the last 40 years has witnessed the assembling of but one mob which the police could not handle without the assistance of the military. That was in July 1871, when the Orange lodges of the city undertook to parade on the anniversary of the Battle of the Boyne. Announcement of their purpose evoked threats of violence from the Catholic Irish, and, fearing trouble, the governor of the State ordered five regiments of the National Guard to escort and protect the procession. Policemen were also detailed to surround and guard it. The point of departure was the corner of Eighth Avenue and 29th

Street, and at the appointed hour in the afternoon of 12 July the paraders began their line of march,—a detail of patrolmen in front, then a regiment and next the Orangemen, with a moving wall around them, and two other regiments bringing up the rear. Before they had moved two blocks a volley of sticks and stones from sidewalks, house-tops and windows rained upon Orangemen, police, and soldiery, many of whom were injured. Angered at this treatment, the members of one of the rear regiments, not waiting for orders, fired, some into the crowd and others at house-tops and windows. There was only one discharge, but 54 persons were slain. After this one deadly volley, police clubs and bayonets held some of the rioters at bay, while the greater number turned and ran as the reserve patrolmen along the line hastened to the scene. The remainder of the march passed without incident.

The political history of New York during the first half of the last century was a varied and turbulent one, but with a steady trend toward making the government democratic in all its branches. Until 1834, the mayor, as has been noted elsewhere, was chosen by the State council of appointment or by the common council of the city, which method of selection brought to the office such men as Edward Livingston, DeWitt Clinton, and Philip Hone. After 1834, however, the mayor was elected by the citizens, to whom in the meantime had been granted an unrestricted suffrage. A dozen years later the judiciary was also made elective, and thenceforth most local officers were chosen in the same manner. During this period the Democratic party was the one most often in power. The Federalists, or their successors, the Whigs and Republicans now and then gained the upper hand; but in the long run the Democrats, under the leadership of Tammany Hall, a secret organization whose social and benevolent aims had been early put aside for political ones, always recovered their hold on the reins. The first mayor chosen by popular suffrage was a Democrat, and so were most of his successors prior to the Civil War. A Republican in 1862 succeeded to the office, but Tammany Hall soon regained control of the municipal government, and for several years political corruption ran riot in the city. Tammany Hall's master spirit at that period was William M. Tweed (q.v.), an able, but coarse and unscrupulous man, who following 1865 organized the politicians of his own party and a number of the local Republican leaders of the baser sort into a gigantic conspiracy to plunder the city. The Tweed Ring, as it was called, attained its greatest power in 1869, when it was master of every department, not only of the city, but also of the State government. Its greatest scheme of robbery was the building of a new court-house in City Hall Park. Work on this structure was begun under a stipulation that the cost should not exceed \$250,000, but before 1871 \$8,000,000 were expended on it, more than \$1,000,000 of this sum being traced to Tweed's pocket. The end came in 1871, when the *Times* exposed the operations of the ring. Then an aroused public sentiment compassed its defeat at the polls, and this was followed by the prosecution and imprisonment of the chief offenders, Tweed himself dying in a felon's cell.

The material prosperity of the city has in-

NEW YORK—NEW YORK CENTRAL RAILROAD

creased steadily in the last 40 years. A chief factor in the making of the New York of to-day was the construction of the elevated railway system, completed in 1880 through the efforts of Cyrus W. Field. This brought all parts of the island within easy distance of each other, and the unbroken lines of city blocks which quickly followed in its wake wrought a complete transformation in the region in and about Harlem, formerly an isolated suburb reached only by horse-car or steamboat, but now as near the heart of trade as 14th or 42d street was in earlier years. More recently the cable-car and the electric trolley-car have ministered to the increasing need for rapid transportation, and the present year (1904) marks the completion of an underground railway system. The bridge across the East River, completed in 1883, having been found inadequate to the needs of an ever-growing population, a second has been built and two others are being thrown across that stream, while private enterprise is making ready to bind the Jersey shore to Manhattan by driving a tunnel under the North River.

The territorial expansion of New York has the while more than kept pace with its material development. By an act of the legislature passed in 1873, the corporate limits were carried across the Harlem, and a part of Westchester County, amounting to 13,000 acres, erected into city wards. A dozen years later a movement was set on foot to include in one municipality Manhattan Island, Brooklyn, part of Queens County, Staten Island or Richmond County, and yet another portion of Westchester County; and in 1890 a commission of eleven members, headed by Andrew H. Green, was appointed to inquire into and report upon the expediency of the project. The labors of the commission took shape in a bill passed by the legislature in 1894, which provided for the submission of the question to a vote of the people of the cities, towns and villages included in the proposed consolidation. The people gave their vote in November of the same year, and only the residents of Mount Vernon and the town of Westchester failed to record their approval. Meanwhile, by act of the legislature, West Chester, East Chester, Pelham, and Wakefield (or South Mount Vernon), were in June 1895 annexed to New York city, whereby another 20,000 acres were brought within the corporate limits, and Westchester township's vote against consolidation rendered ineffective. This carried the city line to the limit in Westchester County recommended by Commissioner Green and his associates, and in January 1896 a bill was passed by the legislature which made Kings County, a portion of Queens, and all of Richmond integral parts of Greater New York. The same year a commission of nine members was appointed by the governor to frame a charter for the new municipality and report the same to the legislature; and its labors had issue in a bill which on 5 May 1897 received the signature of the governor. This measure, which took effect 1 Jan. 1898, divides the city into five boroughs—Manhattan, the Bronx, Brooklyn, Queens, and Richmond—embracing an area of a little less than 327 square miles, and counting a population in 1900 of 4,766,882. Thus, fulfilling its imperial destiny, has the village of 250 years ago become the second city in the world. Consult the publications of the

New York, College of the City of. See COLLEGE OF THE CITY OF NEW YORK, THE.

New York Academy of Sciences, THE, was originally incorporated in 1818 under the name 'The Lyceum of Natural History in the City of New York.' The title was changed in 1876. There are four classes of members in the association: active, fellows, corresponding and honorary. Annals, memoirs and many pamphlets are published under the auspices of the society.

New York Central and Hudson River Railroad Company, the incorporate name of one of the great transportation systems of the United States. Having its beginning in 1826 as the Mohawk and Hudson Railroad with less than 20 miles of track and an equipment of but a single train, this remarkable railroad system, popularly known as 'the Four Track Road,' has resulted in the consolidation of over 100 small railroads, and in 1903 it operated as owner or lessee over 3,243 miles of track. In 1903 the New York Central carried 42,437,265 passengers, which required an equipment of 2,118 cars and 547 locomotives. In its transportation of freight during the same year the road employed 63,542 cars and 936 locomotives.

The Beginning.—The growth and development of the New York Central extending over the period from 1826 to 1904 is typical of American commercial progress. The genesis of the great corporation was the Mohawk and Hudson Railroad, chartered in 1826 and opened 12 Sept. 1831. It was the first railroad built in the State of New York. The name was changed a few years later to the Albany and Schenectady. Together with nine other small railroads the Mohawk and Hudson was merged into a corporation, organized under a special law, 2 April 1853, called the New York Central Railroad Company.

The Central.—The ten roads comprising the New York Central were: (1) the Albany and Schenectady; (2) the Schenectady and Troy, chartered in 1836, and opened in 1842; (3) the Utica and Schenectady, chartered in 1833, and opened in 1836; (4) the Mohawk Valley, organized in 1851; (5) the Syracuse and Utica, chartered in 1836, and opened in 1839; (6) the Syracuse and Utica Direct, chartered in 1853; (7) the Rochester and Syracuse, a consolidation of the Auburn and Rochester (1836), and the Auburn and Syracuse (1834); (8) the Buffalo and Rochester, a consolidation of the Tonawanda Railroad (1832) and the Attica and Buffalo (1836); (9) the Rochester, Lockport and Niagara Falls Railroad, organized in 1850; (10) the Buffalo and Lockport, chartered in 1852, and opened in 1854. This consolidation gave the New York Central a continuous line of railway from Albany to Buffalo. The following roads were subsequently leased and then merged into the consolidation: Rochester and Lake Ontario (1855); Buffalo and Niagara Falls (1855); the Lewiston (1855), and the Saratoga and Hudson River (1867).

NEW YORK CITY.

NEW YORK'S NEW TRANSPORTATION SYSTEM.

NEW YORK CITY

A bird's-eye view of the Jersey shore opposite New York, showing arrangement of tunnels and connecting railroads. The lower McAdoo tunnel—the Hudson and Manhattan R. R. runs from the old Pennsylvania station at Jersey City to Cortlandt street, New York, serving the Central Railroad of New Jersey, the down-town branch of the Pennsylvania and the Erie. The upper McAdoo tunnel—the New York and Jersey R. R.—runs across from about the Lackawanna station in Hoboken to Morton street, New York, serving the Lackawanna. Both tunnels serve primarily the Jersey suburbs, electric subway trains passing through Bergen Hill. The Pennsylvania tunnels are for the Pennsylvania Railroad, the main line being diverted from above Newark, across country behind Bergen Hill and then through hill and under river at Weehawken to the new Pennsylvania terminal at Thirty-second street, New York. Several connecting railroads will enable passengers on the Central, the Erie, the Lackawanna and the West Shore to pass through New York for points in New England.

NEW YORK CENTRAL RAILROAD

The Hudson River.—The Hudson River Railroad Company was chartered 12 May 1846. It leased the Troy and Greenbush Railroad, which was chartered in 1845, and in October 1851 opened the new Hudson River line through its entire length from New York city to East Albany. At this stage of the development there were the two consolidated systems, the Hudson River (New York to Albany), and the Central (Albany to Buffalo).

The Consolidation.—On 1 Nov. 1869, the New York Central and Hudson River Railroad Company was organized by the consolidation of the New York Central Railroad Company and the Hudson River Railroad Company. This gave a direct line from New York city to Buffalo. The new company added the following extensive roads to its system: (1) the New York and Harlem, chartered in 1831, and extending from 42d street, New York, to Chatham, included a lease of the New York and Mahopac Railroad from Golden's Bridge to Lake Mahopac. (2) The Spuyten Duyvil and Port Morris Railroad, six miles long, chartered in 1867. (3) The Geneva and Lyons Railroad, from Geneva to Lyons, distance 14 miles. (4) The Syracuse Junction Railroad, a local system. (5) The Buffalo Junction Railroad, between East Buffalo and North Buffalo. (6) The Troy Union Railroad, chartered as a terminal line in 1851, and originally owned by the city of Troy. (7) The two Hudson River bridges, owned by the Hudson River Bridge Company, and crossing the Hudson at Albany and East Albany. (8) The Dunkirk, Allegheny Valley and Pittsburgh Railroad, leased until 1873. (9) The West Shore Railroad. (10) The New Jersey Junction Railroad. (11) The Beech Creek Railroad. (12) The Rome, Watertown and Ogdensburg. (13) The Mohawk and Malone Railroad. (14) The Carthage and Adirondack Railway. (15) The Gouverneur and Oswegatchie Railroad. (16) The New York and Putnam Railroad. (17) The Pine Creek Railway. (18) The Syracuse, Geneva and Corning Railway. (19) The Fall Brook Railway. (20) The Wallkill Valley Railroad. (21) The Boston and Albany Railroad. Many of these consolidated lines were in themselves great railway systems and are worthy of brief historical sketches.

The Boston and Albany.—On 4 Sept. 1867, the Boston and Albany Railroad Company was formed by the consolidation of the Boston and Worcester Railroad Corporation and the Western Railroad Corporation, and later, 1870, the Boston and Albany Railroad Company consolidated with itself the Albany and West Stockbridge Railroad Company and the Hudson and Boston Railroad Company. Other roads going into the Boston and Albany were the Springfield and North Eastern, the North Brookfield, the Pittsfield and North Adams, the Ware River, the Providence, Webster and Springfield, the Chester and Becket. The entire Boston and Albany system was leased to the N. Y. C. & H. R. R.R. on 15 Nov. 1899 for a term of 99 years.

The West Shore.—The West Shore system was composed of the New York, West Shore and Buffalo and the Syracuse, Ontario and New York, under the name of the West Shore Railroad Company, and was leased to the N. Y. C. & H. R. R.R. Co., 5 Dec. 1885, for 475 years. This

lease was ratified by the New Jersey State Legislature.

The Beech Creek.—The Beech Creek Railroad Company was organized 29 June 1886, as the successor of the Beech Creek, Clearfield and Southwestern, chartered 1883, and extending from Williamsport, Pa., to the southern line of Clearfield County, a distance of 100 miles. This was leased to the N. Y. C. & H. R. R.R. on 1 Oct. 1890, for a period of 999 years.

Rome, Watertown and Ogdensburg.—In 1860 the Rome, Watertown and Ogdensburg Railroad was organized by the consolidation of the following roads: Watertown and Rome, Potsdam and Watertown, and subsequently added the Lake Ontario, the Syracuse and Northern, Windsor Beach and Ontario, Rochester and Lake Beach, the Norwood and Montreal, Fulton and Oswego, Syracuse, Phoenix and Oswego, Oswego and Rome, the Utica and Black River, the Clayton and Theresa, the Black River and Morristown, the Ogdensburg and Morristown, and the Carthage, Watertown and Sackett's Harbor. This system was leased to the N. Y. C. & H. R. R.R. on 14 March 1891.

The Mohawk and Malone.—This company was organized in 1892, by the consolidation of the Herkimer, Newport and Poland; the Herkimer, Newport and Poland Extension and the Saint Lawrence and Adirondack. This company's property was leased to the N. Y. C. & H. R. R.R.

The New York and Putnam.—Organized in 1892, this company represented a merging and consolidation of the New York and Northern; Yonkers Rapid Transit, New York City and Northern; New York, Westchester and Putnam; the West Side and Yonkers and the New York, Boston and Montreal. The system was leased to the N. Y. C. & H. R. R.R. on 30 Jan. 1894.

The Fall Brook.—This system included the Blossburg and Corning, the Wellsboro and Lawrenceville and the Cowanesque Valley, and was leased to the N. Y. C. & H. R. R.R. on 11 April 1899, for 999 years.

The Dunkirk, Allegheny Valley and Pittsburgh.—Organized 1 Dec. 1872, this system had been the result of a consolidation of the Dunkirk, Warren and Pittsburgh, the Warren and Venango and the Conewango Valley. It was leased to the N. Y. C. & H. R. R.R. in 1872 for a period of 501 years.

The Directors.—The directors of the N. Y. C. & H. R. R.R. at its organization in 1869, were Cornelius Vanderbilt, William H. Vanderbilt, Augustus Schell, Horace F. Clark, Daniel Torrance, Chester W. Chapin, James H. Banker, Samuel Barton, Joseph Harker, George J. Whitney, Samuel F. Barger, Wm. A. Kissam, and H. Henry Baxter. Of this original directorate the only survivor in 1903 was Samuel F. Barger. The directors in 1903 were Wm. K. Vanderbilt, Chauncey M. Depew, Frederick W. Vanderbilt, J. Pierpont Morgan, Charles C. Clarke, Wm. Bliss, H. McK. Twombly, Geo. S. Bowdoin, Samuel F. Barger, Wm. Rockefeller, D. O. Mills, W. H. Newman and E. V. W. Rossiter.

The Presidents.—The presidents of the N. Y. C. & H. R. R.R. Company have been Cornelius Vanderbilt, Wm. H. Vanderbilt, James H. Rut-

NEW YORK CUSTOM-HOUSE — NEW YORK PUBLIC LIBRARY

ter, C. M. Depew, Samuel R. Callaway and William H. Newman, in the order named.

Characteristics.—The entire system of the N. Y. C. & H. R. R.R. consisted in 1903 of 1 main line, 2 contract lines, 13 branch lines and 59 leased lines and branches of railroad. It had a total mileage of 3,242.49; has 1,374 steel bridges, 136 stone bridges, 89 wooden bridges, 180 trestles, 13 tunnels, 8 grain elevators, a fleet of 205 barges, ferryboats and other vessels, and employed an army of 50,000 men, to whom \$33,000,000 are annually paid in wages. The lines of the company extend through the States of New York, Pennsylvania, New Jersey and Massachusetts.

In 1903, the New York Central owned large proprietary interests (through ownership of stock) amounting to \$115,267,134, in the Lake Shore and Michigan Southern, the Michigan Central, the Chesapeake and Ohio, the New York, New Haven and Hartford, and sundry other railroads.

New York Custom-House, in New York, perhaps the most imposing custom-house in the world. It occupies an entire block, irregular in shape, bounded by Bowling Green, Whitehall, State, and Bridge streets. The frontage on Bowling Green is 191 feet; on Whitehall Street and State Street about 268 feet; and on Bridge Street about 278 feet. It has seven stories above the sidewalk and two below, the entire cubical contents being about 8,400,000 cubic feet. Its cost was \$4,500,000. The exterior of the building is constructed of Maine granite, is monumental in design, and is richly embellished by carving and sculpture, by the most eminent sculptors in America. The architectural style is that of the Renaissance period. A few public rooms are specially decorated and finished in fine marbles, including the offices of the collector, the main halls, and also the central rotunda. The building is the finest custom-house in the world, both as a structure, and as an office for transaction of customs business.

New York Historical Society, The, an association organized 20 Nov. 1804, for the collection and preservation of historical matter relating to the United States in general and the State of New York in particular. The collections of the society are rare and valuable. In the department of antiquities is the Abbot collection of Egyptian antiques, which is considered one of the finest in the world. The art gallery, which contains nearly 1,000 paintings and 200 portraits, includes the Bryan gallery of old masters, the Durr collection, New York gallery of fine arts, and the works of the American art union. The library has a valuable collection of books, maps, manuscripts and engravings. From 1857 to 1903 the collection was housed in the society's building at 170 Second Avenue, New York. In November 1903 a new home for the society at 77th Street and Central Park West was dedicated and the historical treasures owned by the society have since been removed to the new building.

New York Public Library, established 23 May 1895 by a consolidation of the Astor, Lenox and Tilden libraries. Legally this was an amalgamation of three corporations known as the Tilden Trust, the trustees of the Astor Library, and the trustees of the Lenox Library. From these institutions 25 trustees were selected

to serve as members of the new corporation. The agreement of consolidation provided for the establishment and maintenance of a free public library and reading room in the city of New York, with such branches as might be deemed advisable for the continued promotion of the objects and purposes of these several corporations. The Astor Library (267,000 volumes) was founded in 1849, by John Jacob Astor, and his endowment was increased, and land and buildings added, by the beneficence of various members of the Astor family. The Lenox Library (86,000 volumes) was founded by James Lenox, who gave land on Fifth Avenue, between 70th and 71st Streets, large funds and valuable collections of Bibles, manuscripts, and Americana. It received subsequently large endowments from his sister, Miss Henrietta Lenox, from Mrs. R. L. Stuart, and others. The Tilden Trust (20,000 volumes), incorporated in 1887, was created by the will of Samuel J. Tilden, made in 1884, which gave his entire residuary estate to trustees to establish and maintain a free library and reading room. A long contest in the courts resulted, before the termination of the suit, in an agreement of compromise by which the Tilden Trust became possessed of over \$2,000,000.

In addition to the main library the work is carried on in 42 branches, of which 35 are in Manhattan, 5 in The Bronx and 2 in Richmond. Administration of the circulation branches is conducted by the trustees in accordance with a contract entered into between the city and the library in 1891 and 1902. Prior to the opening of the new library building, the main branches, the Astor and the Lenox libraries, contained works for reference, and had no books for general circulation.

The trustees of the New York Public Library soon after the consolidation in 1895 determined to pursue a liberal policy and to create a great library system not only for the use of scholars, but for the people. The best permanent site for the future great library was considered to be in Bryant Park, on Fifth Avenue, between 40th and 42d Streets, on the site of the city reservoir, which had become obsolete and was practically unused. On 25 March 1896 the trustees made a formal address to the mayor asking aid from the city in securing the site of the reservoir, and in May 1896 the legislature passed a law authorizing the removal of the reservoir and the lease of the land to the library. On 19 May 1897, another act was passed providing for the construction by the city of a library building on the reservoir site, and for its lease to the library, which act was amended in 1900, removing the limit of cost. On 10 November, Carrère and Hastings were selected as architects for the new building, and, on 1 December, the plans were approved by the city. After delays, owing to the failure to appropriate funds for the work, the removal of the reservoir was begun on 6 June 1899 and the new building was opened to the public on 23 May 1911. Exclusive of the books and collections which it contains, it had been erected and furnished at an expense of about \$9,000,000, on ground valued at about \$8,000,000.

The new library building was not intended to be a great monumental building which would look as well from one point of view as an-

NEW YORK.

THE NEW YORK CUSTOM HOUSE.

NEW YORK STATE UNIVERSITY

other and which would be fundamentally an example of pure architectural form. It is described by the architects as "modern Renaissance, more or less of the Louis XVI period, with such modifications as the conditions and needs of our age have suggested." The facade on Fifth Avenue has poise and character and seems to issue to the people "an invitation to enter rather than a command." The total quantity of constructive marble in the building is about 375,000 cubic feet, quarry measure. The general plan is rectangular, 300 feet long on the Fifth Avenue front. There are four floors besides the cellar. The sides and front are comparatively low, the top floor being lighted by windows and skylights; while the centre and rear parts, which are in the form of a T, rise much higher and are lighted entirely by windows.

Of the great libraries of the world, the New York Public Library is fourth in size, possessing approximately 2,000,000. It is notably strong in famous old manuscripts and rare editions; illuminated and Oriental manuscripts; works on American history and genealogy; the history of printing; books belonging in the Oriental, Hebrew, and Slavonic departments, and works on the history and illustration of ancient and modern art in all its phases.

It is in truth a great treasure house of ancient and modern learning, the character and importance of which can only be thoroughly appreciated by those who have constant occasion to use the library. Students from all parts of the country and indeed from all parts of the world are daily visitors seeking special information.

New York State University. The University of the State of New York is a State department and at the same time a federation of more than 1,900 institutions of secondary and higher education. Its object as defined by law is to encourage and promote education in advance of the common elementary branches; and this is accomplished through an organization embracing high schools, academic departments of union free schools, academies, colleges, universities, professional and technical schools, libraries, museums, study clubs, extension courses and similar agencies. Its government is conducted by 19 elective regents and four ex-officio regents, the governor, lieutenant governor, secretary of state and superintendent of public instruction. The officers of the University are a chancellor and a vice chancellor, who are regents, and a secretary, who administers the department, and has charge of the immediate supervisory work. The regents grant, alter, suspend or revoke charters, confer honorary degrees, appoint boards to examine candidates for admission to the professions, and distribute state funds to secondary schools and free public libraries. They exercise supervision over secondary institutions through a system of preliminary and academic examinations, combined with inspection, and over professional education through their power to admit qualified students to professional schools and state examinations, and license candidates who have met the State tests or otherwise proved their fitness to engage in practice. The annual meet-

ing is held the first Thursday in December, and other meetings as business requires. Since 1892 the regents have held 204 committee meetings and 43 full board meetings, the latter attended by an average of 14 members. In 1903 the appropriations for the department and the schools and libraries to which it apportions money were \$661,456.31, including the fund of \$350,000 for secondary schools. The University consists of six departments, Administrative, College, High School, Home Education, State Library and State Museum.

In 1754 letters patent were granted to a corporation under the name "Governors of the College of the Province of New York in the City of New York in America." Chapter 51 of the laws of 1784 vested all the rights, privileges and immunities of this corporation (then Columbia College) in the regents of the University of the State of New York, who were thereby "erected into a corporation or body corporate and politic, and enabled to hold, possess and enjoy" these rights, privileges and immunities, together with such other powers as were granted by this act. The original charter of the University authorized the regents "to found schools and colleges in any such part of this State as may seem expedient to them . . . every such school or college being at all times to be deemed a part of the University and as such subject to the control and direction of the said regents." At first the existence of the University was closely associated with that of Columbia College, and the idea of a governing board distinct from all teaching institutions but bringing all into vital relations with the State was attained somewhat later. In 1787 the incorporating act received important modifications, and the regents' powers took the shape which they have ever since possessed. The authorship of the University has been the subject of discussion, generally being ascribed to Alexander Hamilton; but the honor must be shared with James Duane and Ezra L'Hoummedieu, as well as other men who took part in the establishment of the institution in 1784 or contributed later to its final organic form. The name regents was naturally adopted for the administering body by men who had the English universities in mind while they were laying the foundation of an educational structure; but the scope of the regents' functions was early determined in an original direction by the needs and freer conditions of education in the American commonwealth.

From the beginning the supervision of courses of education in high schools and academies has been the chief function of the regents, the foundation on which the whole system of higher, professional and technical education rests. In 1784 New York had no system of secondary schools. Such schools now (1911) report 134,865 students and a total net property of \$38,604,686, with expenditures for the year of \$10,612,531.68, property and expenditures being thus divided between high schools and academies: high school property \$27,232,829, high school expenditures \$7,745,358.38; academy property \$11,371,857, academy expenditures \$2,867,173.30. The following table shows the growth in academies since 1870:

	1870	1880	1890	1900	1910
Academies	135	86	104	140	167

NEW YORK UNIVERSITY

The regents are charged with the duty of administering the statutes which provide for the general education and special training of professional practitioners. In 1910 as the results of State examinations the Regents licensed 514 physicians, 8 osteopaths, 137 dentists, 27 veterinary surgeons, 605 registered nurses, 53 certified public accountants, and 9 optometrists. Under the exemptions of the various professional laws the Regents also licensed 76 physicians, 58 dentists, 5 veterinary surgeons, 66 registered nurses, 185 optometrists. The improvement of commercial education and of business schools has been stimulated by their influence and standards. In 1784 Columbia was the only college in New York State. Harvard had been founded in 1636, Yale in 1701, but no serious movement was made in New York in this direction till 1746. In 1910 the universities, colleges, professional and technical schools connected with the university system reported 33,792 students, 4,543 teachers, and a total net property of \$117,596,979, and expenditures for the year of \$16,209,642.40. In 1910 there were 11,152 students in colleges of liberal arts, 3,154 students in medical schools, 542 students in dental schools, and 4,037 in schools of engineering and technology. The total expenditure for elementary, secondary and higher institutions was \$72,520,858, and the expenditure for the public school system \$50,665,532.

The State Library and the associated Home Education department combine a number of education agencies, including the Library School, traveling libraries and pictures, extension classes and literary clubs. The total number of volumes in the library is 498,392. Tuition fees amounting to \$2,827.50 were collected in the Library School; \$2,347.21 traveling library fees and \$407.50 from other sources were received—a total of \$5,582.21 turned into the State treasury during the year.

The State Museum, which has developed from the natural history survey undertaken by the State in 1836, comprises departments in geology, mineralogy, paleontology, general zoology, entomology, botany and archaeology; and is engaged in pure research and practical scientific experiment. Its collections, representing the investigations pursued under its direction, are extensive and valuable.

The University publishes numerous bulletins in education, history and science, which are widely circulated among students of the subjects.

JAMES RUSSELL PARSONS, JR.

Formerly Secretary University State of New York.

New York University, established in 1830 in New York city. The first steps toward the founding of the university were taken in December 1829, when nine prominent citizens of New York met to discuss the project of establishing an institution of higher learning in the city. Through their efforts the co-operation of various literary and scientific institutions was obtained, a standing committee was organized, and \$100,000 subscription raised, most of which was contributed in comparatively small sums. In 1830 the University Council was elected by the subscribers and the university incorporated in 1831. In 1832 the collegiate department was opened

for instruction. The ideals of the university were from the first most liberal; the address of the standing committee issued in 1830 stated three fundamental principles which have been consistently adhered to: (1) "The object of the University shall be to extend the benefits of education in greater abundance and variety and at a cheaper rate than at present they are enjoyed"; (2) "Persons of every religious denomination shall be eligible to all offices" that the University may never be under sectarian control; (3) Those attending the University shall pursue studies according to their own preference "having an unlimited choice of the branches taught in the institution."

The present organization of the University includes eight schools, besides the Summer School and the Woman's Law Class. These schools are: the University College (founded 1832), including the College Extension department; the School of Applied Science (1862); the Graduate School (1886); the University Law School (1835); the University and Bellevue Hospital Medical College (founded as the University Medical College in 1841); the School of Pedagogy (1890); the New York American Veterinary College (1899); the School of Commerce, Accounts and Finance (1900). The university senate comprises the deans of the Union Theological Seminary, the General Theological Seminary (New York city) and the Drew, New Brunswick, Catholic, and Jewish theological seminaries. The work of the University College, which had always been largely elective, was in 1894 arranged for the group system; since then the arrangement of groups has been altered, but the principle has been most satisfactory; the groups include the classical, the classical scientific, the Semitic language and literature, political science, philosophy, natural science, exact science, and medical preparatory. The work of the School of Applied Science is arranged on the same principle, the courses include civil, mechanical, marine and chemical engineering. The School of Pedagogy was the first university school to put professional instruction in pedagogy on the same plane with the professional university instruction in law and medicine; it was also the first school to establish degrees in pedagogy; but before its first degree was actually conferred the New York State regents gave the honorary degree of doctor of pedagogy. The Medical College in 1898 was consolidated with the Bellevue Hospital Medical College under its present name; in 1896 this college began requiring a four years' course for all students; this action was in advance of State requirements, as the State law making a four years' course obligatory was not passed till the next year. No university in the Eastern States has grown relatively so fast as New York University; within 20 years (1902) the number of students has more than trebled and the value of its property more than quadrupled. The period of its greatest growth has been since 1891, when a site for a new campus was purchased on University Heights, containing about 23 acres. The University College and the School of Applied Science were moved there in 1894, the summer school is located there, and the scientific work of the graduate school is also done there; the other departments, with the exception of the medical and veterinary, are at

NEW YORK CITY.

GIGANTIC TERMINAL STATION FOR THE HUDSON RIVER TUNNEL AT CORTLANDT STREET, NEW YORK.

The trains from Jersey City will enter Manhattan by the tube shown in the foreground. The single track will diverge into five tracks, which will swing to the left and enter a six-platform station below the large building shown in the background. This building, 22 stories high, will be nearly three times larger than any existing office building, and will house 20,000 people. Trains return to Jersey City by the tunnel shown at the left of building.

NEW ZEALAND

Washington Square. Since that time the curriculum has been enlarged, two new schools besides the summer school have been organized, and the number of students steadily increased. The university organization has also been completed, and the various schools closely affiliated under the government of the University Senate. This senate consists of the chancellor, the deans of the various schools, one professor from each of the schools, and advisory members.

Among the buildings on University Heights the most notable is the library building. An adjoining colonnade, with museum below, is known as the Hall of Fame (q.v.). The library emphasizes the seminar rooms, of which there are eighteen, each with its stack room adjoining, the greater number of the books are in these seminar stacks; in 1905 there were 82,000 volumes. The total value of the university plant was over \$2,750,000, one of the most valuable educational plants in the United States. The students in 1905 numbered 2,524, the professors and lecturers and instructors 286.

1. **New Zealand**, a colony of Great Britain in the Pacific Ocean, 1,200 miles east of Australia, consisting of two principal islands known as North Island and South or Middle Island, besides Stewart Island south of Middle Island, and several small outlying islands. The group lies between lat. 34° 20' to 47° 30' S.; long. 166° to 178° E. The length of the group, north to south, is about 1,000 miles; the maximum breadth 200 miles; it has a coast line of 4,500 miles; and an aggregate area of 104,751 square miles. North Island comprises 44,468 square miles, Middle Island 58,525 square miles, Stewart Island 605 square miles, total 103,658 square miles, the rest being divided among Cook and other islands in the Pacific Ocean, since 1901, officially attached to the colony. New Zealand is divided into nine provincial districts, of which four—Auckland, Taranaki, Wellington, and Hawke's Bay, are in North Island, and five—Nelson, Marlborough, Canterbury, Otago, and Westland, in South Island.

Topography.—New Zealand is one of the loneliest of civilized countries of any importance. The shortest sea voyage between its ports and those of Australia is a run of 1,200 miles. It is separated from the coast of Chili by 4,000 miles of open ocean, while north and south empty sea wastes stretch to the Antarctic and Polynesia respectively. The archipelago itself, when the voyager at length reaches it, stands boldly up, showing, as a rule, steep shores backed by a hilly or mountainous interior. The three main islands have a coast line of 4,330 miles. Long curving beaches of sand or shingle, backed by cliffs or sand-dunes, often extend for many leagues. But even where the hills do not thrust their sides or spurs into the surf, they are so seldom far away, and, on the east coast are usually so clearly visible through the bright atmosphere, that the first impression left by New Zealand is of a chain of half-submerged highlands, broken, precipitous and picturesque. When, as on the mid-east coast of the South Island, or on the west of the North Island, the shores themselves are low-lying and commonplace, the striking background catches the eye and redeems the land-

scape. It is, however, where the mountains meet the ocean, or where long sea-arms wind in among the ranges, that the coastal scenery is found, the fame of which has gone abroad. In many of the sounds of the southwest a combination of grandeur and soft loveliness is seen, exceeding in sublimity the sea-coast between Alaska and Vancouver, and in richness and color leaving the Norwegian fiords behind. Among inlets other than these, Cloudy Bay and Blind Bay in the South Island, and the Hauraki Gulf, the Bay of Islands, Wangaroa, and Hokianga are, perhaps, the more noted. Wellington, the capital, stands on a noble harbor, Port Nicholson. For commerce, the harbors of the colony are often less convenient than might have been looked for in a group so narrow and deeply indented. The southwestern sounds aforesaid give access only to uninhabitable Alps. From Martin's Bay northwards there is not a single port on the western coasts which is not hampered by a bar. Kawhia, the best of them, lies out of the way of settlement. Even on the east coast, Lyttelton, Port Chalmers, and Napier, the third, fourth, and sixth ports of the colony, have had to be improved at great cost, and the same is the case with Bluff Harbor, the port of departure at the south end of the country, and with Westport and Greymouth, where most and the best coal is shipped. The truth is that many of the deep, sheltered gulfs are not just where traders would wish to have them. Fortunately, Wellington and Auckland are exceptions, and these have become the two chief ports of New Zealand.

The official area of the colony is 104,751 square miles. This includes not only the smaller coastal islands of New Zealand proper, but outlying groups like the Chathams to the east, the Aucklands to the south, and a number of Polynesian islets (the chief of which are the Cook cluster and Niue), which politically belong to the colony. Of the whole area, the North and South Islands cover all but about 2,000 square miles. In size as in configuration and climate, New Zealand may be more fairly likened to Italy and Sicily than to the British Islands. Long mountain ranges form a backbone, stretching — save for the gap made by Cook's Straits — from Puysegur Point at the extreme southwest of the South Island to the East Cape and the Bay of Plenty in the North Island. Between latitudes 43° and 46° the summits rise into the region of eternal snow. Several of them reach heights of between 10,000 and 12,000 feet, and Aorangi (Mount Cook), the highest peak in the islands, attains 12,349 feet. Here are glaciers, which on the western slopes descend and penetrate the evergreen pine and beech forests, while on the eastern side their size surprises geologists and mountain climbers. Some of the figures showing their extent are these:

Name	Area of Glacier	Length of Glacier	Greatest Width	Average Width
	Acres	Miles ch.	Miles ch.	Miles ch.
Tasman	13,664	18 0	5 14	1 25
Marchmont ..	5,800	10 70	1 5	0 66
Godley	5,325	8 0	1 45	1 3
Mueller	3,200	8 0	9 61	0 80
Hucker	2,416	7 25	0 54	0 47

NEW ZEALAND

Among these ranges lie seven large and many small lakes. They vary greatly in beauty, but Wakatipu, Manapouri, and the western arms of Te Anau challenge comparison with the lakes of Switzerland.

North of the 43d parallel the mountains, though somewhat less in height, are no longer a backbone merely. They extend right across the island, and the seaward flank of one fine double range, the Kaikouras, towers above the eastern coast. The broken and difficult surface of the northern end of the South Island has had a marked effect on the course of settlement and politics. Southward from the Kaikouras population is growing fairly dense along the eastern and southeastern coast as far as the district served by Bluff Harbor. In this stretch is found the largest flat plain—Canterbury—in the islands, and many roomy valleys, flats, and manageable slopes. The open, grassy character of the land made rapid occupation easy. Two-fifths of the population of the colony are to be found between the points last named, within 40 miles of the coast. To the north, however, settlement is still thin and patchy; the southern railroads stop 80 miles short of Cook's Straits; the southern provinces communicate with Wellington by a line of steamships from Lyttelton, halfway down the South Island. As if to separate the bulk of the North Islanders still more from the majority of the Southerners, Nature has made the butt end of the North Island, for 30 miles behind Wellington, poor, wind-beaten, and hilly. Only after leaving this unattractive knuckle-end do we come to fertile expanses on both sides, and in a central hill-encircled plain, the Wairarapa. Except in the east round Napier, on Hawke's Bay, very little of this attractive country is a dead level. Rolling downs, steep hills of moderate height, narrow, rich river-valleys, mark it everywhere. Great tracts of it are, or were, clothed with thick forest, the rest mainly with tall bracken. Generally the note within 40 miles of the coasts is fertility. A green, moist, warm land more suited, as a rule, for pasture, spreads along the west coast as far north as the mouth of the River Waikato, and on the east to the mouth of the Rangitaiki, on the Bay of Plenty. The centre of the island is a plateau of from 1,000 to 2,000 feet in height, lying round Lake Taupo, and dominated by volcanic cones, of which several are active and others have exploded within man's memory. Ngauruhoe (7,550), and Ruapehu (9,008), are the most restless of these. The most beautiful rises, not on the plateau, but out of the plains by the western shore. It is the solitary, symmetrical Egmont, and is 8,250 feet high. A line drawn through Ruapehu northward to White Island, in the Bay of Plenty, passes through a tract of about 650 square miles incessantly disturbed by volcanic activity. Warm or boiling springs, geysers, pools of boiling mud, fumeroles, solfataras, colored lakelets are numerous. Cold lakes and waterfalls add to the picturesqueness and the healing powers of the thermal waters, and complete the attractions of a much visited district.

In and near this volcanic territory the soil is mingled with pumice, and is not suitable for grass, though trees and long-rooted plants may do well there. South of Lake Taupo, and east

of the great volcanoes, a patch of true desert is encountered. Bordering on the comparatively barren pumice area is found both to the east and west the fertile country already referred to. Here the usual formation is that locally called *papa*. This is a calcareous stratum resembling soft limestone, and the fertility of even the most broken hilly surfaces of the *papa* districts was attested by the fine trees and tall bracken which usually covered them. These are now giving way to the artificial grasses of the colonists.

The deep, richly clothed gorges cut by the rivers of these districts supply the most romantic river scenery of the islands, notably in the valleys of the Wanganui and the Mokau.

North of latitude 38° the island narrows into a long peninsula, indented again and again, and well nigh cut in twain where the Waitemata (the harbor of Auckland City) almost meets the Manukau. In this northern Division the climate of the east coast differs little from that of the west, for there is no central spine; save on the hills, frost is rare; north of the 38th parallel, indeed, the mangrove fringes the shores, and palms, olives, oranges, guavas, and the cane-brake flourish. Here is the home of the giant Kauri pine, and here are the swamps and hillsides from which is dug the fossil resin, the kauri gum of commerce. The ocean is too near at hand, and too cool for the northern peninsula to be oppressively hot, and, were its soil everywhere fertile, it might be more thickly settled than any other province. Unluckily its strips and spots of rich alluvium are surrounded by larger tracts of stiff clay-marl, only productive after intense and skillful cultivation.

In New Zealand it is the western coast which is the wetter, milder, more luxuriant clothed side. On the eastern, large tracts were found by the whites, quite treeless and clothed with coarse tussock grass. Here pastoral settlement made a beginning, spreading rapidly into the central ranges, to be checked in the South Islands by the forests of the saturated west. In the North Island the climatic distinction is less marked, and there the grazier flourishes in the west, after the native vegetation has been burned away.

Rivers.—Most of the very numerous rivers show the characteristics of mountain torrents, the rapidity, and the cold, pure water running low in summer and disturbed by sudden turbid floods. It says much for the rainfall that very few streams run dry at any time. The volume of water in many is remarkable, notably in the chief river of the South Island, the Clutha, which, despite its strength, is but 154 miles long. In the north, the Waikato is the longest stream in the colony, and that, and four or five others (in the Auckland and Wellington provinces), are navigable by small steamers. Generally the rivers hinder rather than help traffic, though their swiftness and number make them very valuable in furnishing power for machinery.

Climate.—The yearly rainfall varies from 26 inches on the littoral of Canterbury, to 170 inches among the sounds of the southwest. Throughout the settled districts the average is about 35 inches on the eastern, and 60 inches on the western side. The brisk seawinds keep

NEW ZEALAND—NATIVE TYPES

MAORI KING AND QUEEN — WAITAKA TRIBE.

NEW ZEALAND

the sky normally clear, and the amount of sunshine registered is large, except in the south-west, and immediately inland of Mount Egmont. In a country stretching through 13 degrees of latitude the climate naturally is very varied, but generally is very healthful. In the northern peninsula of North Island the conditions are semi-tropical, while in the high lands of Otago and Southland the frosts in winter are very severe, and the summer bracing and temperate. In Wellington, which may be taken as the centre of the colony, the temperature scarcely ever falls more than one or two degrees below freezing point; while in Auckland, the most northerly of the large cities, the heat is tempered by sea breezes, and never reaches the intensity which makes life in summer so trying in the great Australian cities. Rapid changes of temperature are caused by sudden shiftings of wind, and are somewhat trying to new arrivals in the country.

Geology and Mineralogy.—To the geologist the two large islands are a continuity, and form the remnant of a continent which once extended eastward and was probably connected with South America. A great leading range of Palaeozoic rocks stretches through both islands, branching out in the south to enclose the extensive schistose area of Central Otago. Upper Mesozoic formations have also enormous development; and in the North Island their outcrops are distinguishable through the volcanic deposits which cover a good part of the surface. In this island are also extensive areas of hydro-thermal agency, marking the expiring activity of volcanic outbursts. So late as 1886 there was a violent eruption of Mount Tarawera in the Hot Lake District, during which the celebrated Pink and White Terraces of world-wide fame as natural wonders disappeared; it was previously supposed to be an extinct volcano; Mount Tongariro and Ngauruhoe, in the heart of the island, also are still active. Sedimentary rocks, chiefly of gray sandstone, are often seen, both among the ridges of the interior, and on the coast, where they frequently form precipitous cliffs; but the far greater part of the rocks are crystalline. Among a great variety of fossils the most notable are those of a gigantic bird, the Moa (*Dinornis giganteus*), which survived down to recent times. New Zealand is extremely rich in mineral deposits, and gold mining forms one of its staple industries. Gold was first discovered in 1853, and the total value of the output to the end of 1904 was £65,136,648. The great gold producing regions are the Thames district of Auckland, the west coast of the South Island, and the interior of Otago. During the last few years the method of raising gold by dredging the beds of rivers has developed to a remarkable extent. The extensive coal measures are also a source of wealth. Among many varieties the best is the bituminous coal of the west coast of the South Island, which is equal in quality to that found in any part of the world. The output has been steadily increasing, and for 1905 amounted to 1,585,756 tons. Copper, chrome ore, manganese ore, sulphur, and other minerals have been worked with varying success. Working miners make good wages, and there is a good deal of independent prospecting. Mining schools have been established in different parts of the colony, and the

study of mineralogy is pursued with considerable zeal.

Flora, Fauna, etc.—Among vegetable productions the most characteristic are the ferns (130 different species), which form almost the only vegetation over immense districts. Some of them are more than 40 feet high, and remarkable for the elegance of their forms. The flax plant furnishes an article of export. A number of the forest trees furnish valuable timber, among them the rare kauri or damar pine. Flowering plants are remarkably scarce, save in the Alps, and there are no indigenous fruits.

In animals New Zealand is singularly deficient, only a sort of dog, now extinct like the moa, a rat, and two species of bats, being indigenous. Rabbits have been introduced and have multiplied so as to become a perfect pest; pigs now run wild, as well as cats. Pheasants, partridges, quails, and red and fallow deer have been successfully introduced, also the brown and rainbow trout. All the common European quadrupeds appear to be easily acclimated. Pigeons and parrots are the most common native birds. Among others are the apteryx (a wingless bird), the huia, the tui, or parson-bird, and the owl-parrot. The chief reptiles are a few lizards. The coast waters teem with fish, and seals are still numerous in some parts.

Population.—The population is now about 950,000, or 8½ to the square mile. It is still very scanty in the western half of the South Island; in the interior of the North Island between latitudes 40° and 38°; in the great shoulder between Hawkes' Bay and the Bay of Plenty; and in the far north of the Auckland peninsula. Elsewhere it is steadily spreading over the land up to a height of about 1,500 feet above sea-level. The advance, however, has never been rapid. The warlike native tribes, from whom land has had to be acquired by tedious purchase, have not been the only obstacle. To the difficulties of the stiff clay-marl and pumice soils must be added the denseness of the forest, the oft-recurring hill and mountain barriers, and the innumerable ravines and swift torrents, making roads and bridges very costly. Furthermore, a small archipelago placed in the southern ocean to be a lonely outpost of civilization does not attract any full stream of immigrants from Europe. So, 21 years after annexation the white population had reached but 99,021. In 1881 it had attained to 489,923. In 1891 it was but 626,650. The colored population estimated at 45,000, has been stationary for many years. The Maori and Polynesians do not increase. The Chinese, who in 1881 numbered 5,000, have been reduced to 2,500 by exclusion laws—modified copies of those of the United States. The official census of March, 1901, returned a population of 815,862 persons, or, excluding Maori and Polynesians, 772,719. The latter number had risen by 20 April 1906 (the date of the latest census) to 888,639, an increase of 115,920 in five years and one month. Of the whites, 471,055 were males and 417,584 females, in 1906. An excess of males over females is also found among the Maori, while among the Chinese only 71 females were enumerated in 1906. The increase by excess of births over deaths is satisfactory. This is mainly due to the extraordinarily low death-rate which, contrary

NEW ZEALAND

to predictions, does not rise, and remains the lowest of any civilized country. In 1905 the death-rate stood at 9.46 in the thousand, as compared with a birth-rate of 27.22. The excess rate in favor of life, is therefore, 17.66, and takes a high place in the tables of international vital statistics. During the 12 years, 1880-1892, the birth-rate fell rapidly from 40.78 to 27.83. The fall then grew much slower, though it continued until 1899, when the rate stood at 25.12. Since then it has gradually recovered a. The proportion of children to each marriage is now 3.22, as against 5.01 in 1885. The marriage-rate was 8.28 in 1905. The percentage of illegitimate births was 4.57. There can be no doubt that the decline in the birth-rate was almost entirely due to the deliberate limitation of families by potential parents. It is believed that the Maori tribes mustered about 65,000 at the time of annexation. Their decrease since has been mainly due to the prevalence among them of tuberculosis and venereal diseases.

The movement of the white population since 1901 is given in the following table:

Year	Estimated population on 31 December (excluding Maoris and for annexed Pacific Islands)	Increase during Year		
		By excess of births over deaths	By excess of arrivals over departures	Net increase
1901	287,657	12,857	6,122	20,579
1902	307,920	12,280	7,914	20,579
1903	331,505	23,302	11,275	24,976
1904	357,539	14,671	20,355	25,034
1905	382,462	15,622	9,308	24,930

Between 1870 and 1885 the gain by immigration was relatively large; but in the seven years, 1885-1891, the colony actually lost 20,000 people, mainly to Australia. Beginning in 1892 there has since been a gain amounting in all to 74,602. Two-thirds of this has come from Australia, and the remainder from Great Britain. The excess inflow from the Mother Country is steady but small, fluctuating between 2,000 and 3,500 a year. The Government encourages certain classes of emigrants, notably farmers, farm laborers, domestic servants, and navvies, by paying part of their passage money. An assisted immigrant can now travel from London to Wellington for £10. Exclusion laws have been passed to shut out criminals, prostitutes, lunatics, aged paupers, and the diseased or crippled. In addition to the landing tax of £100 on Chinese the Government reserves the right to subject non-British incomers to a language test. Apart from those relating to Chinese and disease it cannot be said that all the restrictive regulations are stringently enforced. The colony relies mainly on its distance from large centres, the cost of the voyage to it, and the smallness of its quiet towns. It offers few attractions to active criminals, and is too remote for paupers.

The proportion of females to every 100 males in New Zealand was 70.52 per cent. in 1871; 88.26 in 1891, and 90.33 in 1901.

The Church of England claims 40.84 per cent. of the people. The proportion of Presbyterians is 22.87; Roman Catholics, 14.23; Methodists, 10.86. Jews number 1,611. Excluding these last and the Chinese, the number of persons professedly non-Christian does not appear from the census to exceed 30,000.

The proportion of British descent is over-

whelming. At the census of 1901 the birthplaces of 772,277 New Zealanders were ascertained. Only 11,615 persons had been born outside the Empire. Of the white foreigners, by birth or descent, then in the colony, a considerable majority were of Teutonic or Scandinavian blood. Compared with Australia, New Zealand has a larger strain of Scottish and a smaller stain of Irish blood. In 1901 67 per cent. of the population were New Zealand born.

Chief Towns.—New Zealand is a decentralized country. Its main centres of population are the four towns of Auckland, Christchurch, Dunedin, and Wellington. Of these Auckland is the largest as it is the most beautiful, while Wellington, the political capital, disputes the hindmost place with Dunedin. Wellington, however, is overhauling its rivals. No other first-rate harbor is found on the North Island within 500 miles of the capital. It is the financial and banking centre of the islands and the rapid expansion of its sea-trade suggests that it may yet challenge Auckland's leadership. Auckland taps the grazing and dairying valley of the Waikato, the quartz goldfields of the Thames, Coromandel, and Waihi, and conducts a trade with the South Seas as well as with Australia. Christchurch is the market-town of the chief agricultural district, and is something of a manufacturing as well as an educational centre:

POPULATION OF FOUR CHIEF TOWNS WITH SUBURBS.

	March, 1901 (census).	April, 1906 (census).	
Auckland	67,226	82,129	93,544
Wellington	49,344	62,844	73,697
Christchurch	57,041	67,861	76,700
Dunedin	52,390	56,024	61,279

Christchurch lies inland, about five miles from its sea-port, Lyttelton. The other three towns are seaports though most of the shipping trade of Dunedin is done by Port Chalmers, seven miles from the city, and outside its ring of suburbs.

Wellington, close packed between steep hills and sea-shore, is already complaining of congestion, high rents, and the lack of garden-space. The other towns are roomy and comfortable enough, with well-planted, neatly-kept suburbs and spacious recreation grounds. There are no sky-scrapers and no slums. Wood is still the chief material in dwelling-houses, and the ratio of inhabitants to each house is 4.82. The architecture is commonplace; the rectangular streets fairly wide; the paving respectable; the hotels unpretentious, but clean and moderately cheap; the theatres small; the telephonic and telegraphic conveniences cheap and good. Electric tramways are now found in the chief towns. Drainage and sanitation are excellent. Each of the four towns has two or three daily newspapers very like decent English journals of the second rank. New Zealand, indeed, is a land of newspapers, for its journals of all sorts and sizes number 204.

Liquor Laws.—The consumption of liquor—chiefly beer and spirits—is not relatively high, nor is drunkenness especially prevalent. From the year 1881 to 1895 the consumption per head steadily diminished. From 1896 to 1904 it as steadily rose again, with the improving prosperity of the colony. The liquor-bill, which was £2,265,000 in 1895, swelled to £3,152,849 in 1904 and was still £3,120,705 in

NEW ZEALAND—INDUSTRIES AND FINANCE

1905. The charges of drunkenness in the police-courts rose from 4,676 in 1895 to 8,057 in 1901 and 9,615 in 1904. This is the more noteworthy because since 1893 a drastic local option law has been in operation, under which the selling of liquor has been stopped in six districts, while the licensed houses of the Colony have been reduced in number from 1,715 to 1,350. The strength of the Temperance Party, also, is more than considerable. At the local option polls held on 6 Dec. 1905, 198,768 persons voted for prohibition against 182,884 for the continuance of licenses. For reduction of the number of licenses—an alternative permitted by the local option law—151,057 votes were cast. The police obtained 151 and 113 convictions against sly grog sellers in 1903 and 1904 respectively.

WILLIAM PEMBER REEVES,
High Commissioner for New Zealand in London.

2. New Zealand—Industries and Finance.

Agriculture.—The Colony's founders looked forward to making it an agricultural settlement. Even now, however, it remains mainly devoted to grazing and mining. The deliberate State encouragement of small as against very large holdings of land has not substituted tillage for grazing. The small farmer is a dairyman more often than not, or he owns a few hundred sheep, and develops mixed farming. Wool is still the chief export, with frozen meat second. Next comes gold, with butter and cheese fourth. After them follow hemp, kauri gum, and tallow. Oats take a good place in some years as in 1902, when the value shipped was £761,000. Or they may fall low, as in 1904, when the value exported was but £185,000, and 1905 when it was even less. Wheat, like coal, goes almost entirely into local consumption, though 9,000,000 bushels were grown in 1905.

The same may be said of barley,—1,128,000 bushels in 1905,—and maize,—490,000 bushels. Yet as already stated the country is well adapted for cereal-growing. During the last 14 years the average yield of wheat has only once fallen below 20 bushels an acre and in 1905 it was 35.36. In the same year the average yield of oats was 42.53 bushels an acre; of barley, 38.26. A large acreage under root-crops—632,000 acres in 1905—is mainly an adjunct of meat-freezing. The roots are used for fattening sheep and lambs for export.

It was the fall in the price of cereals followed by the discovery of the use of refrigeration applied to the transport of food products which turned New Zealand farmers from cereals to meat, butter, and cheese. They found that artificial grasses,—cocksfoot, timothy, clover, rye-grass—would grow admirably in the islands, carrying and fattening far more stock than the native pastures. They began the process of laying down land in artificial grasses, with which 14,000,000 acres are now clothed. The export of frozen meat dates from 1882, when 1,707,328 pounds were sent to London. The rapidity of its growth may easily be shown:

MEAT EXPORT.

Year.	Lbs.
1885	33,204,976
1890	100,934,756
1895	127,018,864
1900	205,621,072
1905	191,054,912
1908	237,473,936

Butter and cheese began to be sent across the sea in 1889, and has been exported regularly since, mainly to the United Kingdom. The increase in the case of butter has been large and continuous:

EXPORT OF BUTTER.

Year	Cwts.
1890	34,816
1895	57,964
1900	103,871
1905	305,662
1908	229,972

Cheese has advanced in 18 years from 26,558 cwts. to 88,776 cwts.

One of the two products much of which goes to the United States is the fibre of the native flax, the New Zealand hemp of commerce. The export of this has increased of late years (from 13,251 tons in 1900 to 28,209 tons in 1905). The price fluctuates with the prices of manila and sisal. In a year when prices are firm it will fetch £30 or £31 a ton in London. The value of the export in 1905 was £730,803.

Minerals.—So far, the only three minerals exploited in a large way, have been gold, coal, and kauri gum. Good bituminous coal, also brown coal and pitch coal, is found in many districts, notably on the west coast of the South Island, in Otago and Southland, and in the valleys of the Waikato and Mokau. The bituminous coal of the west coast is equal to any in the world and is used by the British Navy in the Eastern seas. The cost of the coal, however, keeps down the export which, beyond that taken by ocean-going steamers for their own consumption, is but 56,000 tons. In the domestic market, the local mines hold their own well and the total output though still small increases steadily as the figures below show:

Year.	Tons.
1880	299,923
1885	511,063
1890	637,197
1895	726,654
1900	1,093,996
1905	1,585,756

The total value of the gold produced since the year 1853 up to the end of 1905 was £67,230,584. For some years the average annual yield has been £2,000,000. The greater part of this is now extracted from quartz. The chief mine is the Waihi, from which, in 1904, £600,000 was obtained. In that and many other mines the cyanide process of extraction or separation is used. About one-fifth of the gold is obtained by dredging, chiefly in the river beds of the South Island. In all about 10,500 persons are engaged in gold mining.

The yield of silver has been inconsiderable, amounting to about three-quarters of a million sterling in 53 years.

The average value of the kauri-gum export is roundly half a million sterling a year. Though it is a monopoly, the price fluctuates considerably. In 1903, for instance, it averaged £67.8.11 while in 1904 it fell to £54.10.7. Almost all of it is sent to London or the United States, where it is chiefly used in the preparation of varnish.

Iron ore is found in abundance, but has not yet been turned to commercial account. In May 1906 a petroleum spring was tapped near New Plymouth from which oil flowed at the rate of 100 barrels a day.

NEW ZEALAND—INDUSTRIES AND FINANCE

Trade.—In proportion to population the external trade is large, amounting as it does to £32 a head, after excluding specie. This is the more remarkable as there is virtually no transit trade. The imports are for local consumption only; exports represent local production. Up to 1886 imports exceeded exports; since that year the position has been reversed as the following table will show. Exports are almost entirely raw material, food, gold, and kauri gum. But much of the material and food goes through certain processes of manufacture or preparation before leaving the Colony.

TWENTY YEARS OF TRADE.

Year.	Imports (excluding specie).	Exports (excluding specie).	Excess of ex- ports over im- ports (exclud- ing specie)
1886.....	£6,319,221	£6,334,513	£15,292
1887.....	6,064,281	6,680,772	616,491
1888.....	5,430,050	7,403,206	1,973,156
1889.....	5,980,583	9,283,954	3,303,371
1890.....	5,088,805	9,550,316	4,461,511
1891.....	5,431,101	9,560,859	4,129,758
1892.....	6,744,544	9,440,920	2,696,376
1893.....	6,404,870	8,680,845	2,275,975
1894.....	5,990,177	9,221,550	3,231,373
1895.....	6,115,953	8,518,119	2,402,166
1896.....	7,035,379	9,990,007	2,954,628
1897.....	7,994,801	9,741,822	1,747,021
1898.....	8,211,409	10,440,838	2,229,429
1899.....	8,613,656	11,923,422	3,309,766
1900.....	10,207,386	13,823,258	3,615,872
1901.....	11,339,416	12,869,810	1,529,394
1902.....	10,958,038	12,635,450	1,677,412
1903.....	12,075,959	14,971,926	2,895,967
1904.....	12,900,030	14,738,750	1,838,720
1905.....	12,816,691	15,652,047	2,835,356

The trade is still chiefly with Great Britain, Australia, India, and the British Colony of Fiji. The distribution in 1905 was as follows: 83.47 per cent of the imports and 93.76 per cent of the exports representing trade with British possessions.

It will be seen that the United States and Germany almost monopolize such foreign trade as there is. A Preferential Trade Act passed in 1904 imposed special duties of from 20 to 50 per cent on many foreign imports in the hope of transferring trade to Great Britain, but the effect of the law, though appreciable, is not yet large.

Manufactures.—The chief manufactures are meat-freezing, butter and cheese-making, tanning and wool-scouring, engineering, saw-milling, clothing, boot and shoemaking, printing, flax milling. The number of establishments—omitting all government workshops—are officially given as 2,459 in 1896, and 3,163 in 1901. The total approximate value of the land, buildings, machinery, and plant used in the year first named was £5,796,000. The sum rose to £7,959,631. The returns, however, especially of the first named year, are incomplete. The same criticism applies to the official estimates of the number of hands employed in factories and workshops. The official figures in by-gone years were taken on a different system to the present. It is probably very nearly correct to say that 30,000 hands were employed in factories and workshops of all sizes, State and private, in 1891, against 33,000 in 1895; 55,000 in 1900 and 72,000 in 1906. The value of the manufactured output is officially given at £17,000,000 for the year 1900, and as having increased by £7,991,000 since 1895. But both calculations must be taken subject to some deductions. All that can safely be affirmed is that the advance in manufactures during the 10 years, 1896-1905, has been rapid, while in the previous decade it was slow.

Railways.—As late as 1870 there were but 46 miles of railway open for traffic. This had grown to 2,490 miles in 1906, of which all but 84 miles were owned and worked by the Government. The number of passengers carried on the State lines in 1905-6 was 8,826,382 weight of goods carried, 4,415,166 tons; total revenue for year, £2,349,704; percentage of working expenses to revenue, 69.00. Owing to the physical divisions, broken surface, and small population of the Colony, the railway system is difficult to manage cheaply. Public opinion demands safety, comfort, low freight charges, and good pay and short hours for employees. All these desiderata are obtained. But, after paying working expenses, the return of revenue is but 3.3 per cent on cost of construction.

Government Undertakings and Labor Legislation.—As landlord, railway, telegraph and telephone operator, and constructor of public works, the State is a considerable employer of labor. But though the Government does most of the business of land transfer, and conducts that of life, accident, and fire insurance, is the chief trustee of intestate estates, and works two coal mines, it does not systematically compete with private enterprise. It does, however, regulate and supervise industry to an extent unsurpassed

in any other democratic and civilized country. The Department of Agriculture disseminates information, inspects flocks and herds, slaughter-houses, and dairy factories; examines, grades, and brands food products and certain other exports. Its work is believed to be honestly and efficiently done. The Department of Labor inspects all factories, workshops, and retail shops, however small, and controls servants' registry offices, even fixing the scale of fees that these last may charge. A Shop Hours Act restricts the business hours of retail shops and the working hours of merchants' clerks.

A Workmen's Compensation Act outruns in liberality the English law upon which it is based. But the most remarkable statute dealing with the relations of employers and workpeople is the Industrial Arbitration Law, passed in 1894, for the purpose of superseding strikes and lockouts by the arbitration of State tribunals empowered to give decisions legally binding. Under this elaborate enactment compulsory awards may be given or agreements voluntarily entered into and registered, dealing with all industries where wage-earners are organized in unions. The act is constantly invoked and is accepted by both capital and labor, though with occasional complaints. Its practical results have been so far the disappearance of labor conflicts, the stamping out of sweating, a general improvement of the conditions of labor, coupled with a tendency to refuse to grant a large and sudden increase of pay.

Side by side with the Labor Laws an Old Age Pensions Act, passed in 1898, provides for the poor of both sexes, after the age of 65, a pension not exceeding £26 a year. An applicant for a pension must be of good character, have lived 25 years in the Colony, and have an income of less than £60 a year. (Married couples must have less than £90.) The pension diminishes by one pound a year on each pound of private income above £34 a year possessed by an applicant; the act is cheaply administered, the cost being less than £4,000 a year. Nor does it seem to have yet diminished national thrift.

Land and Land Taxing.—The census of 1901 showed the number of farmers, graziers, and gardeners to be large:

Farmers	33,067
Ranholders	3,800
Gardeners and fruitgrowers	3,637

The total number of freeholders of more than five acres of rural land increased from 30,764 in 1883 to 43,735 in 1902. The land held in freehold is now roundly 17,000,000 acres; that leased from the Crown about 15,000,000 acres; that leased from private persons and public corporations 3,500,000; from the native tribes 1,750,000. About 70 per cent of the occupied land is held in holdings of less than 200 acres.

One of the avowed objects of the Democratic and Progressive political party formed in 1877 was to restrict the growth and reduce the extent of large landed estates, and multiply small farms and holdings. This rather than Land Nationalization was, and is, their policy. Before the year mentioned, land monopoly, allowed to grow almost unchecked, had locked up great areas of fertile land in almost unpopulated pastoral properties. As late as 1898, considerably more than half the Crown lands which

had so far been alienated were shown to be held in this manner. 584 owners possessed 10,400,000 acres. The pastoral leases of the Crown were on a similar scale; for 12 leaseholders occupied 2,541,000 acres. A law advocated by Sir John McKenzie limited acquisitions of Crown land in freehold to one square mile of agricultural land. After 1891, the same statesman caused much of the public land to be leased at a quitrent for 999 years instead of being sold, reduced the average area of the pastoral leases, and in 1894 carried a law authorizing the State to compulsorily expropriate private owners at a price to be determined by arbitration. In 13 years the State has repurchased roundly 800,000 acres, for which somewhat less than four and a half million sterling has been paid. Of 137 properties, all but four were bought by friendly treaty. Over 11,000 souls are already settled on the repurchased land, as perpetual State tenants, and the rents collected from them in 1905 amounted to £164,000. The yearly profit to the Treasury is now about £33,000. The rents are punctually paid and the farmers are thriving.

The graduated land tax imposed in 1891 had for one of its objects the subdivision of the larger estates. In place of the tax hitherto levied—a property tax of one penny in the pound on the capital value,—landowners had thenceforth to pay the penny on the unimproved value only of their estates. All building, improvements, and live stock were exempted. Small holdings were exempted up to the value of £500. The tax, therefore, fell lightly on small or moderate-sized farms. On estates the unimproved value of which reached or exceeded £5,000, a special tax was levied, graduated so as to press with severity on the greater properties. This tax mounts by eight steps from one-sixteenth of a penny on £5,000, to a maximum of threepence in the pound on land holdings valued at £210,000. For land tax purposes, mortgages are deducted when assessments are made; a penny in the pound is levied on them but the money lender, not the landowner, pays it. The effect of the deductions and exemptions allowed under the land tax is to relieve nearly four-fifths of the 116,000 landowners of the colony from the impost altogether.

Income and Other Taxes.—All incomes over £300 a year, not derived from land, are subject to income tax. On incomes between £300 and £1,300 a year the tax is sixpence in the pound; above £1,300 sixpence on the first £1,000, and one shilling on the excess. Companies pay one shilling in the pound on all profits. Foreign companies pay only on profits made in New Zealand. The following table for the year ending March, 1909, shows how small a share of the total public revenue is drawn from direct taxes:

HEADS OF REVENUE.		Ending March, 1909.
Customs		£2,801,248
Railways (gross)		8,918,507
Stamps		1,591,368
Land tax		604,901
Income tax		381,044
Beer duty		116,914
Registration and other fees		157,067
Marine		43,805
Miscellaneous		264,310
Territorial revenue		227,857
		<hr/> £29,001,125

NEW ZEALAND—INDUSTRIES AND FINANCE

In the 10 years from 1895-06 to 1904-5, the income tax collected increased by 174 per cent though the population grew by 23 per cent only—a striking indication of the relative growth of wealth.

Public finance.—Public finance, important in all countries, has had an especially direct influence on the history of New Zealand, where it has moulded and been affected by local circumstances and a policy of State-socialism. From the first the government of the Colony has been a borrower, and has gradually run up a debt, mainly external, and in 1906 reaching £62,192,000. It may be convenient to divide the financial story into four periods. In the first of these, the 30 years between 1840 and 1870, borrowing was mainly the result of exceptional necessities—pressing needs for funds to buy out the New Zealand Company, to buy lands for settlement from the aboriginal tribes, and to pay the cost of wars with these owners of the soil. A few public works, including one considerable railway, were begun locally and taken over by the central authority.

After thirty years the Colony with less than a quarter of a million whites owed £7,000,000. Then, incited by a bold and very able Jewish financier, Sir Julius Vogel, the colonists resolved to undertake the opening up of the islands on the lines of the development of a large unoccupied estate. Railways, telegraphs, roads, and bridges were to be pushed on; more land was to be bought from the natives, immigrants were to be imported in large batches. To this end the treasury was to borrow money in London.

Millions were borrowed and spent and, in the main, well spent. By 1881 the white population rose to 301,000. But in 1879 a financial crisis due to falling prices, bad banking, and a wild land speculation had smitten the Colony, and ended the second of the four periods. The resulting depression did not begin to pass away until 1895 and during the intervening years confidence in the policy of State borrowing and development weakened.

In 1895 the commercial cloud began to lift. Prices of raw products were rallying. The settlement of the waste lands was increasing production. The effects of refrigeration in stimulating the export of butter, cheese, and still more frozen meat was putting money into the farmers' pockets. The Progressive Party determined to borrow, not only to continue public works, but to break up monopoly by land resumption and to cheapen money by lending money on mortgage to the middling and smaller farmers. In August, 1895, then, a loan of £1,500,000 was raised in London. And during the 11 subsequent years borrowing has gone on at an accelerated pace. To-day, we have the spectacle of a heavily indebted government which nevertheless easily raises a large and growing revenue paid by a prosperous community without serious complaint or hardship. £3,750,000 sterling being raised in the year by taxes which amount to £1 13s a head. Yet trade and production advance rapidly, the wealth of the people has grown to £305 sterling per head, and a fiscal policy which might seem oppressive to the mass of consumers is lightly borne by a democracy which might lightly abolish it.

The explanation is, perhaps, to be found in

the beneficial character of the purposes upon which the borrowed money has for many years been spent. It has not been wasted in wars or upon the up-keep of a court or any army. The party now in office is certainly spending freely but the following analysis shows that the aims of the outlay are defensible. Between March, 1891, and March, 1905, £21,081,650 have been borrowed and spent in the following manner:

Public works	£8,458,214
Repurchase of private land for settlement	4,361,566
Purchase of native lands	6,497,000
Loan on mortgage to farmers	3,200,000
Loan to local bodies	2,087,000
Sinking fund accretions	1,646,000
Bank of New Zealand preference shares ..	500,000
Lands improvement	500,000

In addition to the £21,000,000 analyzed above, nearly £5,000,000 from surplus revenue has, since 1891, been added to the loan moneys and expended on development.

Banks and Savings Banks.—The Government has a substantial interest in the Bank of New Zealand, the chief chartered joint-stock bank in the Colony. The Government holds £500,000 sterling invested in preference shares of the institution and has guaranteed its debenture stock. In return the Government appoints the auditor, two bank directors, and a president with a veto. The bank, which was in desperate straits when, in 1893, the Treasury intervened to rescue it, is now prospering, and its ordinary shares which, in 1894, could not be given away, are now quoted at the price of £9.10s.

The five banks of issue which transact the ordinary banking business of the Colony are all colonial: two are New Zealand companies, three are Australian. They hold coin and bullion to the amount of £4,000,000 and the extent and progress of their business is thus indicated:

Year	Deposits.	Assets.	Liabilities.
1887	£343,316	£419,860	£432,404
1890	3,737,769	6,313,354	3,819,670
1895	8,538,935	14,320,775	9,550,177
1898	12,368,610	17,735,859	13,356,508
1900	15,570,610	17,314,533	16,904,582
1904	19,074,960	20,893,090	20,943,359
1905	20,545,601	21,770,595	22,144,165
1908	21,821,733	29,098,507	28,311,908

Most of the savings bank deposits are made in the public post-office savings bank, which has 510 offices and held £28,39,307 to credit of its depositors in 1904. Ten years previously the sum to their credit was £4,066,394. The five private savings banks hold on deposit about £1,000,000.

The Government money-lending on mortgage to farmers and others is managed by the Advance to Settlers Office. In 10 years loans amounting to £4,174,000 have been authorized by the lending board controlling the office, in sums averaging £312 each. Most of the money has been loaned on rural freehold. The rate of interest charged is five per cent *plus* one per cent sinking fund applied to pay off the principal. The debt is thus automatically extinguished by 73 half-yearly payments. The legal and other charges of the office are very low. Up to the present time the office has suffered no losses, and there are virtually no arrears of

NEW ZEALAND—EDUCATION

interest owing to it, while it has already accumulated a reserve fund of £125,000.

3. New Zealand—Education. The first generation of settlers labored persistently to set up local schools. It was not, however, until 1877 that a national scheme of education available for all children alike, white and Maori, was established by the General Assembly. On the whole the measure of success gained by the friends of education has been high. New Zealanders may point to a university, to many secondary schools, and to a really complete and efficient system of primary teaching. During the last decade a creditable advance has been made in manual and technical class-work. The training of teachers, too, receives fair attention. Industrial schools for criminal, destitute, and neglected children have been successful in preventing the growth of any ‘larrikin’ class. The Government maintains a school for deaf-mutes, and an Institute for the Blind has been founded by private generosity. The bulk of the money for education is taken from the general taxes, though substantial rents are drawn from land reserves. The Parliamentary vote spent in the year 1904-5 was £592,000, an increase of £225,000 since 1890. In the University and in secondary schools fees are charged. In the primary schools instruction is free in the six standards of the regular course; special and higher subjects are charged for. The primary system is secular, and attendance at some school is compulsory between the ages of seven and 14. The school attended may, however, be a private one, or a child may receive tuition at home. How seldom this privilege is abused is shown by the figures dealing with illiteracy among the population.

The average attendance at the primary public schools in the year 1904 was 116,506, and the number on the school-rolls at the end of the year 136,282. The percentage of attendance throughout the year was the very creditable proportion of 85.18. During the same year no less than 7,020 Maori or half-caste children attended school, a high number when it is remembered that the whole colored population amounts to but 43,000. The private primary schools of which two-thirds belong to the Roman Catholic Church, instruct 16,000 pupils. In round numbers 157,000 New Zealand children get elementary schooling. This means in the Government schools a good deal more than the three R’s. It includes history, geography, vocal music, drawing, and elementary science. Boys are drilled and girls taught needlework. Military instruction is given to 14,000 cadets. No religious teaching of any kind may be given within school hours, though the attachment of the great bulk of the people to Christianity is shown by the muster-roll of the Sunday schools. This reaches 107,100.

There are 1,785 elementary public schools occupying 3,718 teachers, classed as follows:

Adult men.....	1,778
Adult women.....	1,797
Pupil teachers (male).....	144
Pupil teachers (female).....	905
	<hr/>
	3,718

The proportion of women teachers is much lower than in the United States. The average net salary of a male adult teacher is £175; of a woman teacher £96. About half the colored school-children go to special village schools provided for the Maori race. The others attend the ordinary public schools where they consort on equal terms with white children.

The Minister of Education is the head of a central department, entrusted with the general supervision, financing, and protection of the national system and the direct management of the Maori Schools, industrial schools, and the schools for deaf-mutes. The ordinary public elementary schools are administered by provincial boards of education elected by school committees of parents and guardians. Of these committees one is attached to each school. The boards and committees appoint teachers in conjunction; the boards select and pay their own school inspectors—a weak point in the system.

The industrial school children number 2,000. Of these only one-third live in the Government reformatory schools; about one-third are boarded out; about another third are handed over to the authorities of Roman Catholic schools carried on under government inspection. A peculiarity of the New Zealand industrial school system is that the State remains *in loco parentis* to all its pupils until they are 21 years of age.

Secondary schools are of two divisions—district high schools controlled by the boards of education, and endowed schools (sometimes clerical), managed by governors of their own, but inspected by the Department of Education. Altogether about 6,500 children get secondary education, and more than two-thirds of them receive it free. About £9,000 is voted for open public scholarships, tenable at these schools.

The University of New Zealand is an examining, not a teaching body. It is controlled by a Senate of 24 members. Five local colleges affiliated to it do teaching work, but students may obtain degrees without keeping terms at any of these. None of the colleges are residential. In 1905, 1751 undergraduates were keeping term, 1157 males and 594 females. About 200 non-matriculated students were attending college lectures. The number of degrees granted since the foundation of the University in 1870 was 1018 at the end of 1905. Degrees are granted to women and men indifferently. Hitherto most of the professors and lecturers in the affiliated colleges have been graduates of English or Scotch universities selected in London. Even now, should a New Zealander secure a post, it is sometimes on the strength of academical distinction won in the Mother Country. The degree examinations are still conducted by English scholars. The examination papers set by them are sent to the Colony,

NEW ZEALAND—GOVERNMENT AND HISTORY

and the candidates' answers posted in due course to London. Until lately, the same feeling of ultra-respect for English scholarship and example has been noteworthy in the college methods, and the University has confined its degrees to the five broad departments of arts, science, medicine, law, and music. In 1904, however, further powers were by statute given it to confer the degrees of Bachelor, Master, and Doctor of (a) Veterinary Science, (b) Dental Surgery, (c) Engineering (Mechanical, Electrical, Civil, Mining, Metallurgical, Naval, Architecture), (d) Agriculture, (e) Public Health, (f) Commerce.

In response to local demands the central department will spend money in equipping and maintaining classes for manual and technical instruction, and will even go to the length of erecting special school buildings. In 1904 the number of classes thus recognized and helped was 2,599, with an average attendance of about 13,700, and they are established in 50 localities. Sometimes the education authorities control them, sometimes they are the outcome of voluntary association. The department spent in aid of them in 1904, the sum of £27,425. Several schools of mining (notably one at Otago University College) attract about 270 students in all. Canterbury College supports a School of Engineering attended by 200 students, and a college and farm for teaching agriculture containing 40 resident students.

WILLIAM PEMBER REEVES,

High Commissioner for New Zealand, in London.

4. New Zealand—Government and History.

Constitution. The constitution bears a general likeness to that in force in the colonies of Cape Colony, Newfoundland and Natal. It is in the main founded on an Act of the British Parliament of the year 1852, but the form then drawn up has been more than once amended by the colonists with the assent of the Mother Country. The Governor from England (for by custom he is never a New Zealander), is appointed by the King in Council, and usually holds office for five years. He receives £7,500 a year, and plays the part of a constitutional sovereign acting upon the advice of an Executive responsible to the General Assembly. He may, however, dissolve Parliament or refuse to do so, though asked by his Executive. In practice, his master is the Secretary for the Colonies in the British Cabinet, who may recall him. All acts of the colonial legislature require the Governor's assent, which he may withhold pending a reference to his superiors in London. Acts relating to currency, foreign immigration, ocean-going trade, and constitutional amendments are so referred. Though the Governor is titular commander-in-chief in New Zealand, local defense is entirely controlled by the Executive.

The Colony's Parliament, the General Assembly, is bicameral, consisting of a Legislative Council and a House of Representatives. The members of the first-named, who are appointed by the Governor for terms of seven

years, are the Nominees of the Executive of the day. Two of them are Maori chiefs. Formerly the Legislative Council was supposed to present property and conservatism. Now, owing to the long reign of the Progressive Party, it is little more than a somewhat less energetic replica of the popular Chamber, whose will it seldom thwarts. Councillors receive £200 a year. Their number is not limited, but, by custom, stays at or near 46, and is, just now, lower.

The elective Chamber, the House of Representatives, consist of 76 whites, and four Maori members. All are returned by single-member constituencies for the term of three years. The elections of the white members are all held on the same day. All adults,—of both sexes—who have resided a year in the colony and three months in an electoral district, may register and vote for one candidate. Any duly qualified male elector may himself become a candidate. Members are paid £300 a year, subject to deduction for absence without leave while the House is sitting. Their procedure is based upon that of the House of Commons, but the length of speeches is restricted by a time-limit, though there is no “closure” of debates. The Maori members address the House in their own language, using an interpreter.

Eight salaried ministers comprise the Executive Council. They may hold office as long as they possess the confidence of the House of Representatives, and in practice all important legislation is initiated by them. Roughly speaking, the English two-party system has been copied and for many years a Progressive and a Conservative party have disputed the ground. Party machinery, however, is neither elaborate nor all-powerful. The funds that sustain it are small and electioneering is cheap and singularly free from corruption. The secrecy of the ballot is absolute. The expenses of many successful candidates do not exceed £50 apiece. The proportion of voters to population is extraordinary as the following table—which deals with White electors only—shows:

Date of General Election.	Estimated total adult Persons	Number on Rolls.	Proportion of Adult Persons registered as Electors	Number of Persons who voted	Proportion of Persons on Rolls who voted
1893..	310,010	302,997	94.98	220,083	75.25*
1896..	356,658	339,230	95.11	258,254	76.13
1899..	386,140	373,744	96.79	279,310	77.54*
1902..	429,383	415,789	96.83	318,850	76.69
1905..	539,950	537,003	99.64	428,648	79.82

At the elections December 1905 the number on the rolls was 476,473, and the number voting 395,657.

Women obtained the franchise in 1893, and, as will be seen from the subjoined figures, make use of it almost as freely as men; though they are still ineligible as candidates. An experience of 13 years has shown, by general admission, that female suffrage has done no social or political harm whatever. On the whole, beyond listening to speeches and recording their votes, they take less open and active part in politics

* Excluding figures for three electorates in which there was no contest.

† Including 4,074 informal votes.

NEW ZEALAND—GOVERNMENT AND HISTORY

than was anticipated. They do comparatively little platform speaking. Certainly their vote has not changed the balance of parties. They have, however, strengthened the anti-liquor movement and have stimulated sympathetic reforms touching children and their own sex:

THE WORKING OF WOMEN'S FRANCHISE.

Date of General Election	Estimated Total Adult Females	Number of Women on Rolls	Proportion of Adult Females registered as Electors	Number who voted	Proportion of Females on Rolls who voted
1893....	159,471	109,461	78.48	90,290	82.18*
1896....	159,656	149,303	89.13	108,783	78.44
1899....	177,373	163,215	93.34	119,350	75.70*
1902....	195,783	155,944	94.97	138,585	74.50
1905....	212,876	172,876	100.00	174,629	100.00
1908....	243,504	242,930	99.76	190,214	78.26

Local Government.—Local Government is marked by a subdivision of functions resulting in a large number of directly or indirectly elected boards and councils.

In addition to the boards and committees of education, and to hospital and charitable aid boards dealing with sickness and indigence, the Colony contains the following numbers:

CHIEF LOCAL UNITS.

Boroughs	100
Town districts	34
Counties	94
Road districts	216
Harbor Boards	25
Drainage districts	22

The local franchise is not quite so simply and sweepingly democratic as the parliamentary. In the municipalities mere residence does indeed confer the right to vote, but not on any question relating to loans or rates. In rural districts plural voting is still in force. The revenue of the local bodies comes mainly from rates, license-fees, harbor-dues and rents from land-reserves. The boroughs receive annually about £500,000 from rates and fees. Boroughs and harbor-boards have been considerable borrowers both outside and inside the colony, and the total debts of local bodies reach £9,000,000 sterling. Only one of their number, however, is in financial difficulties. The larger municipalities are beginning to bestir themselves in providing locomotion, lighting, water and other improvements. Generally localities have shown themselves less enterprising than the central government in social and industrial experiments.

History.—The islands were discovered by a Dutch sea-captain, from Batavia, Abel Jansen Tasman, who chanced upon them in 1642, but did not land. Captain Cook was the next recorded comer. He visited the group in 1769 and thrice subsequently, sailing round both islands, mapping them out and describing the shores and the natives. Thereafter came French navigators, American whalers, South Sea traders, beachcomers, runaway convicts from Australia, and, at last, in 1814, missionaries from New South Wales headed by Samuel Marsden. But, although Australia lay under the British flag, the English Government re-

fused or hesitated for 70 years to annex New Zealand. Partly this was due to ignorance of its value, partly to disinclination to interfere with its warlike and intelligent natives whose numbers had been greatly over-estimated by Cook, and whose ferocity and cannibalism made them a name of fear wherever the tales of South Pacific mariners were repeated.

The Maori of New Zealand are a branch of the Polynesian race found in Hawaii, Samoa, and other Pacific groups eastward of Fiji. They are well-built, brown-skinned, pleasant-looking, courteous in bearing and speech. They probably reached New Zealand in the 14th century, sailing in double-canoes. When discovered by Europeans they were divided into a number of small tribes, often at war, and as late as 1770 were neolithic men, using weapons and tools of polished stone and knowing neither pottery nor metal-working. Their artistic qualities found expression in wood-carving, weaving, and dyeing. They did not even employ bows-and-arrows, and in war fought chiefly hand-to-hand with spears and clubs. On the other hand their stockade-building was skillful and their larger huts evinced some advance toward architecture. They were expert gardeners and, in the absence of quadrupeds, clung to the sea-coast, the river-sides, and to lakes and forests where they could find fish and birds in abundance. Their tribal system was based on modified communism. Chiefs and priests controlled them, sustained by the terrors of tapu. Their mythology, many of their legends, and some of their folklore show much poetry and imaginative power. Why they never became numerous is not very clear. Probably their tribal wars, infanticide, and sexual immorality helped to keep them down. Probably also their tropical origin unfitted them to cope with the cold winds and frosts of a temperate climate.

Almost coincidentally with the coming of the missionaries, the Maori began to obtain muskets and gunpowder for use in inter-tribal struggles, with the result that about one-fourth of them were exterminated in 20 years. Then the fighting died down, and between 1830 and 1840 large numbers were converted to Christianity. Unfortunately white land-grabbers began bargaining for tracts of country, making preposterous claims. Finally two colonizing companies, French and English respectively, resolved to plant settlers in the islands. The English company organized by Gibbon Wakefield was the first in the field, its emigrants reaching Wellington in January 1840. Their departure from England forced the hand of the British authorities who despatched a man-of-war, under Captain Hobson, to annex the country. Hobson hoisted the Union Jack on 22 Jan. 1840, and, at Waitangi, concluded a treaty with the natives by which their lands were guaranteed them and they accepted British rule. He chose Auckland as his seat of government. Meanwhile Gibbon Wakefield's company planted settlers at Wellington, Nelson, Wanganui, and New Plymouth in the region adjacent to Cook's Straits, only to find their land-purchases disallowed by the British officials. Ruin overtook them; disputes broke out with the natives, and in the far north at the Bay of Islands the English officials blundered into a war which

* Estimated figures for three elections in which there was no census.
† Including informal.

NEW ZEALAND—GOVERNMENT AND HISTORY

proved the fine fighting qualities of the Maori. A strong governor, Sir George Grey, restored order, conciliated the Maori, bought land and enabled settlement to make headway. Gibbon Wakefield, undaunted by his first difficulties, founded the settlements of Otago (1846) and Canterbury (1850) in the southeast where there was no native opposition. In 1853 England gave the colonists self-government and in 1856 the first executive responsible to the local Parliament took the reins.

For the next 20 years the working of the Constitution was complicated by the existence of local provincial councils with large powers in each of the scattered settlements. Their jealousies and conflicts with the central authority were only brought to an end by their abolition in November 1876. They represented a peculiarity in the organism of the Colony which is even now noticeable. Settled from many points, the country has, even now, no one preponderating city. The jealousies and rivalries of a score of districts still worry governments and amuse travellers from other lands.

Within five years of the grant of responsible executives the colonists found themselves at war with the natives—first with one league of tribes, then with another. English troops, to the number of 10,000 were brought in; but the Maori were not always worsted: the fighting dragged on intermittently for 11 years, to be finally ended by the colonial militia and friendly natives, after the British red-coats had been withdrawn. The colonists found themselves left with a war debt of more than £2,500,000 sterling, while from 1860 to 1871 the North Island made little progress. Taught by this hard lesson, they allowed an able minister, Sir Donald McLean, to pursue a conciliatory policy. Parliamentary representation was given to the Maori, and schools to their children; their land titles were scrupulously respected; while roads were pushed through the interior and rifles kept out of it. Serious disturbances were gradually made impossible.

Meanwhile the South Island was making rapid progress. Early in the fifties enterprising Australian sheep-owners discovered that the eastern moiety made excellent grazing country, and it was soon parcelled out into "runs" or ranches. Then, in 1861, alluvial gold in abundance was found at Tuapeka, in Otago, and soon afterward in Westland. Diggers rushed in by tens of thousands. Agriculture began to spread, and by 1875,—aided by the introduction of the reaper and binder and other farm machines and tools from the United States,—it showed a promise of expansion which has hardly yet been redeemed. After 1872 the North Island began to move forward, encouraged by peace and the making of railways, roads, and bridges. The burning off of the fern and clearing of the forest began to make way for sheep and cattle.

Up to 1877 public affairs were controlled by the employing, landowning, and professional classes and by a few large financial institutions. The franchise was limited. Even the smaller farmers were overshadowed if not overawed. The native wars, the provincial divisions, the all-absorbing work of pioneering delayed the formation of any definite party of democracy. The expenditure of millions of bor-

rowed money on public works also absorbed attention after 1871. In 1877, however, the inevitable development came about, hastened by the appearance of a leader of eloquence and prestige in Sir George Grey, formerly governor. Supported by two lieutenants of greater practical parliamentary talent than himself, Robert Stout and John Ballance, Grey succeeded in forcing on manhood suffrage and triennial parliaments, while his party recast the public education, making it national, free, secular, and compulsory.

Industrial depression which overtook the colony during Grey's premiership in 1879 discredited progressive politics for a while. The farmers, dreading a land-tax, rallied round the more conservative leadership of Sir John Hall and Sir Harry Atkinson. For the next 11 years the story of New Zealand is largely a tale of efforts to find industries more profitable than the growing of wool and wheat—efforts which had their outcome first in frozen meat factories, later on in co-operative dairies. Coal mines were opened with success and two valuable natural monopolies—hemp, (*phormium tenax*), and kauri gum—were exploited. The Parliament cut down public expenditure and reduced borrowing for some years. Labor, now armed with voting power, felt the pinch of depression. Wages fell, the unemployed clamored, tramps abounded. Trade unions began to organize, and socialistic writings to be studied. The small farmers and their sons cried out upon land monopoly and high rates of interest. In 1890 a labor conflict, the Maritime Strike, showed the trade unions,—who were badly beaten therein,—the desirability of making Parliament their battle-ground and of allying themselves with Ballance and the Democrats. At the elections of December 1890 the allied forces swept the polls, and the Liberal or Progressive party, then returned to power, has continued to govern the Colony without a break.

The 15 subsequent years have been marked by a series of bold political and social experiments. These have been latterly so far justified that since 1895 the Colony has regained and enjoyed a remarkable degree of prosperity, while to a large extent its inhabitants seem reconciled to most of the novel enactments. Ballance died in 1893, but his successor, Richard Seddon, a man of robust temper, extraordinary energy, and great natural shrewdness, gained a popularity and influence which seemed quite undiminished at the time of his sudden death in June 1906.

During the Boer War in South Africa public attention was to some extent diverted from local politics, for New Zealanders hotly espoused the mother country's cause and despatched 6,000 mounted riflemen, volunteers, to fight therein. But otherwise colonists have divided their attention not unequally between politics and prosperity. No leader of striking power has come forward to challenge the Progressives, whose majority in Parliament had risen to about three to one at the moment of Seddon's death. The dominant party, however, has experienced a sensible internal change. Labor has less influence, and the farmers more, than was thought to be the case between 1890 and 1896.

NEW ZEALAND FLAX—NEWARK

Few New Zealand men have made any name for themselves outside the narrow limits of their own shores. Gibbon Wakefield, the founder of the Colony, played a conspicuous part in shaping England's colonial policy between 1830 and 1856. He finally settled in New Zealand and was a member of the first House of Representatives, but owing to failing health never distinguished himself in the young community. Sir George Grey (1812-1898) spent nearly 40 years in New Zealand and left a lasting mark on its institutions. A man of literary tastes, he compiled a valuable collection of Maori legends. His services in South Australia and South Africa and the curious contrasts of his career in New Zealand—where he played in turn the parts of absolute ruler and leader of the people—made this eloquent, brave, and refined figure the most interesting in the story of New Zealand. In marked contrast to him stands out the more boisterous but strong, bold, and successful personality of Richard Seddon (q.v.) (1844-1906), a Lancashire mechanic, who entered New Zealand politics in 1879, became Minister of Public Works in 1891, and grasped the Premiership in 1893. Seddon will be remembered in New Zealand, not only for the notable experimental legislation passed during his long term of office and the general prosperity enjoyed, but as the personification of restless energy, bluff, popular geniality, and a devotion to political business, control and management, which undoubtedly wore him out and killed him.

Amongst other New Zealand public men the names of Atkinson, Fox, McKenae, McLean, Ballance, and Stout are the most prominent. Fox, who was more than once Premier, wrote a good history of the fighting with the native tribes in the years 1836-66. Alfred Domett, another Premier, was the literary friend called "Waring" by Robert Browning, and himself wrote a narrative poem 'Ranolf and Amohia,' of no mean merit. The best book in prose yet written by a New Zealander is, beyond question, the 'Old New Zealand' of F. E. Manning, a delightful and accurate study of life among the Maori tribes before annexation.

High Commissioner for New Zealand in London.

New Zealand Flax. See **FLAX**.

Newark, nu'ark, Del., town, in Newcastle County; on the Philadelphia, B. & W., and the Baltimore & O. R. R.'s; about 11 miles south of Wilmington. It is in a section of the State noted for its productiveness. The chief manufactures are paper, machinery, flure, and canned goods.

There is considerable trade in the manufactured articles, fruit, and vegetables. It is the seat of the State College, opened in 1833. The town owns and operates the electric-light plant and the waterworks. Pop. (1890) 1,191; (1900) 1,213; (1910 est.) 1,300.

Newark, N. J., city, county-seat of Essex County, metropolis of the State; in latitude 40° 41' N., longitude 74° 10' W.; on the Passaic River. The city proper is three miles above Newark Bay, eight miles by rail from New York city, and is one of the several cities within the direct zone of the influence of the nation's metropolis. Newark ranks eleventh in manufacturing and fourteenth in population in the United States. The area is 22 square miles of which six square miles are salt meadows. The water frontage on Newark Bay and the Passaic River is 10½ miles, the width of the channel is 300 feet; depth at low tide 12 feet.

Manufacturing.—The city has the distinction of ranking first in the Union in the value of its manufactures and the diversity of its industries, according to its per capita population. In 1909 (Government Census) the city had 1,858 manufacturing establishments, with an invested capital of \$154,233,000; the number of mechanics, members of firms, and clerks, 68,282; the amount paid annually to salaried officials, clerks, and mechanics, \$44,853,000. The annual cost of material used was \$114,679,000, and the value of the annual products was \$202,512,000. The chief industry of Newark is that of leather, over 50 firms with \$5,500,000 capital, producing \$12,000,000 annually. Brewing ranks second, with 20 firms, employing \$6,000,000 capital, and about \$9,000,000 product; jewelry third, with 112 establishments, capital \$4,500,000, product \$6,000,000; machinery fourth, 75 establishments, capital \$4,000,000, product \$4,500,000. Other industries employing upwards of a million capital and producing goods to the value of from one to three million dollars annually are: Boots and shoes, clothing, hats, hardware, trunks and valises, watch cases, corsets, smelting and refining, harness, varnishes and celluloid. The manufacture of celluloid is distinctively a Newark industry; it was invented by Newarkers, and the manufacture of it is peculiar to this city. The Clark Thread Works, Balbach's Smelting and Refining Company, the Crescent Watch Case Company, and several similar industries that are located in this city would of themselves give a standard of importance similar to such places as Lowell, Waltham, and Elgin.

Transportation and Commerce.—The principal railroads entering the city are the Pennsylvania, the Lackawanna, the Lehigh Valley, the Erie, and the Central of New Jersey. The large number of local trains which connect with the New York ferries and the cities on the Hudson give Newark the advantage of the ocean steamer traffic. The Passaic River entering the Newark Bay furnishes the city a most important direct water route to the ocean. Electric lines extend to all the nearby cities and villages. The reports of 1901 show that for that year the steam railroads had carried 10,000,000 passengers to and from Newark; the number of cars loaded with freight was 174,589 (tonnage, 3,671,780). The tonnage of the river freight was 1,447,823.

Buildings and Municipal Improvements.—

There are 30,000 buildings in the city. The principal public buildings are the government building, the county court-house (cost \$1,750,000), the city hall (\$1,500,000), the free public library (\$350,000), the Prudential (\$3,000,000), the Mutual Benefit (\$2,000,000), and the churches and the schools. Several of the banks, insurance companies and business corporations have fine buildings. There are 225 miles of broad streets, 115 miles of which are paved. There are 155 miles of sewers, 87 miles of which are drain-tile and 68 of brick. The streets are lighted by a private corporation. The water plant, owned by the city, furnishes, by gravity, a supply of 50,000,000 gallons per day. There are 275 miles of mains. The original cost of the water plant was \$10,000,000. There are 16 public parks, chief of which are Military (the old training ground), East Side, West Side, Branch Brook, Weequahic, Lincoln, and Washington.

Charitable Institutions.—There are nine hospitals, the largest of which are the City Hospital, the Essex County Hospital for the Insane, Saint Michael's, Saint James', Saint Barnabas', and the German hospitals. There are 14 homes and four orphanages. The House of the Good Shepherd is a home and a reformatory. The Little Sisters of the Poor have a home for the aged over 60 years of age.

Churches and Societies.—There are 170 churches, representing a large number of denominations, 174 lodges, 185 societies, 163 associations, and 92 clubs.

Educational.—There are 46 public schools, 786 teachers, and 38,125 pupils. The value of the public school property is \$4,632,000. There are 21 Roman Catholic parish schools, with 204 teachers and 9,820 pupils. There are 40 private schools, including colleges, academies, business colleges, kindergartens, and elementary schools. The free public library contains 77,297 volumes, which cost \$90,000. Other libraries are the Prudential Insurance Company's Law Library and the Library of the Lawyers' Club. The New Jersey Historical Society has a collection of great historical value. The great civic body of Newark is its Board of Trade, with a membership of 1,000 business men.

Banks and Finances.—There are 16 banks; seven national, four trust companies, and five savings banks. The total deposits aggregate \$50,000,000, and the total assets \$85,000,000. There are 77 building and loan associations, the assets of which are \$10,805,000. There are four fire insurance companies, assets of which are \$8,640,000; two life insurance companies, assets of which are \$127,000,000. The taxable valuation is \$163,303,000; the tax rate, 2.1 on a two thirds basis. The annual revenue is over \$10,000,000. The chief items of expenses for maintenance and operation are: Schools, \$900,000; public library, \$40,000; police department, \$425,000; fire department, \$300,000; public health, \$75,000; public markets, \$20,000; city hospitals, \$65,000; city homes, \$86,000; outside poor, \$40,000; streets and highways, \$275,000; public scavenger work, \$75,000; lighting, \$215,000; sewers and drains, \$61,000.

Vital Statistics.—The number of families is 54,644, and the number of dwellings 30,397. The number of dwellings occupied by owners, 21.1 per cent of the total. The number of births

per year, 61,117, rate per thousand, 24.85 per cent. The number of deaths per year, 4,923, rate per thousand, 18.90 per cent.

History.—Immediately following the English conquest of the New Netherlands, in 1664, a part of the Dutch possessions in North America, being practically what is now the State of New Jersey, was granted to Lord John Berkeley and Sir George Carteret. The settlement of northeastern New Jersey was immediately begun under a liberal form of government, a site near the mouth of the Passaic River proving attractive to certain Congregationalists, then settled in the colony of Connecticut. In May, 1666, the New Englanders removed "their families, their beloved pastor, their church records, and communion service, their deacons, and their household goods" to the site of the future city of Newark. By 1685, Newark, in which the Congregationalists had settled, was a compact town of 500 inhabitants. The system of local government was like that of many early New England villages, being the limitation of political and religious activity, through the agency of the town meeting, to those who professed Congregationalism.

The strong element of conservatism, characteristic of the settlement of Newark, remained unchanged until long after the opening of the 19th century. Religion and education were warmly supported, and for several years the College of New Jersey, now Princeton University, was located at Newark. The tidal waters of the Passaic River gave easy access to New York, the country-side supplying provisions and wood to the inhabitants of Manhattan Island. Newark was also engaged in a coastwise trade. To a degree the young community was somewhat isolated owing to the difficulty of road-building over the marshes and the ridge of rocks separating Newark from Paulus Hook, now Jersey City.

In the Revolutionary struggle Newark took an active part. As early as June 1774, her inhabitants protested against the Port Bill, and offered to become parties to a plan of union to redress grievances. In November of the same year inhabitants of Newark, as members of the Essex County grand jury patriotically answered the charge of the loyalist chief justice, while in January 1775, the royal newspapers were boycotted by many of the inhabitants of the town. In the spring of that year some of the inhabitants declared that they were willing to risk their lives and fortunes for American liberty. The "gentlemen traders of this town" were recommended not to supply provisions to Canada and other loyal portions of North America. In March 1776, the Newark committee regulated the price of West India products, and traders were notified that defiance of regulation would cause the storekeeper to be declared an enemy to his country.

Newark was early identified with the efforts made to secure internal improvements, even before the second war with England. Turnpikes were extended in every direction, bringing the town in close communication with the northwestern portion of the State, from which section Newark has largely drawn men who have become locally prominent. During the early years of the 19th century the first bank organized in New Jersey (1804) was established in Newark, while one of the chain of banks having the word "state" in their titles (1812) was located in this city. In 1824 the city was declared by legisla-

NEWARK—NEWBURN

tive enactment to be the terminal of the Morris and Essex Canal, which was soon constructed, and united the waters of New York Bay with those of the upper Delaware. During the early 30's the New Jersey Railroad was built between Jersey City and New Brunswick, which with Camden and Amboy connections placed Newark on the direct route between New York and Philadelphia. Following the construction of these lines, now a part of the Pennsylvania Railroad system, came railroads now forming parts of the Lackawanna and the Central Railroad of New Jersey systems.

Pop. (1810) 8,008; (1830) 10,953; (1840) 38,804; (1860) 71,941; (1870) 105,050; (1880) 136,508; (1890) 181,810; (1900) 246,070; (1910) 327,460. Consult: Civ records; Atkinson, 'The History of Newark N. J.'; 'Records of the Town of Newark, 1666-1816.'

JAMES M. REILLY,
Secretary Newark Board of Trade.

Newark, N. Y., village, in Wayne County; on the Erie Canal, and on the West S., the Northern C., and the New York C. & H. R. R.'s; about 176 miles west by north of Albany, and 30 miles east by south of Rochester. It was settled in 1830 by people from Rensselaer County in the eastern part of the State. It was incorporated as a village in 1825. It is in a fertile agricultural region, but the village has considerable manufacturing interests. In the tinware works there are 150 employees; in the paper box factories, 150; the glass factory, 50; the canning and preserving factory, 200; and in other establishments fully 200 more employees. Newark has a large trade in farm and dairy products, fruit, and its manufactured articles. Its educational institutions are the Union Free School and Academy, the public elementary schools, and the free public library. There are 10 churches, and a number of church and literary charitable and educational societies. The State Custodial Asylum for Feeble-Minded Women is located here. The three banks have a combined capital of \$175,000. The government, according to the "Village Law of the State," is vested in a president and trustees,—eight trustees—two of whom are elected each year. The population consists of nearly all native born Americans, over one half of whom are of Dutch, German, and Irish descent. Pop. (1890) 3,698; (1900) 4,578; (1910) 6,227.

Newark, Ohio, city, county-seat of Licking County; at the junction of three branches of the Licking River and on the Ohio Canal, and the Baltimore & O., and the Pennsylvania R.R.'s; about 30 miles east by north of Columbus, and within 14 miles of the centre of the State. It was settled in 1802 by a colony from the eastern part of the United States. Nearby are two large mounds which belong to the works of the "Mound Builders." It is in an agricultural region, and in the vicinity are valuable deposits of sandstone, extensive coal-fields and natural gas. The chief manufactures are glassware, chemical instruments, carriages, hardware, bottles, electric cars, locomotives, machine shop products, rope, foundry products flour and lumber products. There are (1903) 21 manufacturing establishments in which there are 7,460 employees. The streets are well paved and well kept. The State Encampment Ground, and the Auditorium, a fine theatre erected as a memorial to dead sol-

diers of the Civil War, are of much interest. There are 15 churches, a high school, public and parish elementary schools, and a public library, established in 1877. The six banks have a combined capital of \$900,000; and the annual amount of business transacted is \$3,000,000. The government is administered under the charters in accordance with the Ohio State Municipal Code. The inhabitants are nearly all American born. Pop. (1910) 25,404.

Newark Series, in geology, a term applied to that part of the Triassic system (q.v.) in eastern North America. Its limits are Nova Scotia on the north and South Carolina at the south. The typical deposits are near Newark, N. Y., whence the name is taken. The deposits in the series are conglomerates; breccias; thick red sandstones, which must have originated in crystalline waste, as is evident from the comparatively large amount of mica and the feldspaths; and basalt, which accompanies the sedimentary rocks and occurs in dikes and sheets, such that the violent volcanic character of their derivation is made certain. Some few fossils occur in the series, scarcely any of marine types, plants and foot-prints preponderating. The commercial value of the deposits of the Newark series is in the brown sandstone building stone of New Jersey and Connecticut, and the coal veins of North Carolina and Virginia.

Newbern, nû'bern (formerly New Berns), N. C., city, county-seat of Craven County, port of entry of the Pamlico district; at the confluence of the Neuse and Trent rivers, and on the Atlantic C. L., the Atlantic & N. C., and the Pamlico, O. & W. R.R.'s; about 100 miles in direct line southeast of Raleigh. It has regular steamer connection with New York and other Atlantic ports. It was settled in 1710 by a company of Swiss and Germans under Baron De Graffenreid. The place was named "New Berne" after Berne in Switzerland. It was incorporated as a city in 1723. It soon became an important southern seaport, on account of its harbor. It was the capital of the Province of North Carolina for several years. It was one of the strongly fortified ports of the Confederacy. (See NEWBURN, OPERATIONS AT, IN THE CIVIL WAR.) The chief industrial establishments are lumber and planing mills, grist mills, shingle factories, fertilizing works, ice factory, knitting mill, pickle works, turpentine distillery, shipyard, carriage factory, lime kiln, canning factory, and the Atlantic & North Carolina railroad-shops, in all having 2,500 employees. There is an extensive trade in lumber, cotton, turpentine, vegetables, and fish. The prominent buildings are, a government building (court-house, custom-house, and postoffice), the county court-house, jail, County Home, and the opera house. The educational institutions are the public schools, separate for white and colored. There are 10 church edifices and others in contemplation. The three banks have a combined capital of \$152,000. The government is vested in a mayor, board of aldermen, and a council of 12 members. The electric-light plant and the water-works are owned and operated by the city. About 95 per cent of the inhabitants are native born Americans. Pop. (1890) 7,843; (1900) 9,090; (1910) 9,661.

C. L. STEVENS,
Editor 'New Berns Journal.'

Newbern, Operations at, in the Civil War. Roanoke Island (q.v.), N. C., was captured by Gen. Burnside 8 Feb. 1862, and on 6 March he embarked his troops for an expedition against Newbern, a point of much military importance, at the confluence of the Neuse and Trent rivers, near the head of an extensive and navigable arm of the sea, and connected by railroad with Beaufort Harbor at Moorehead City. By night of the 11th the entire naval and land command was off the mouth of Stocum's Creek, south of the Neuse, and about 15 miles below Newbern. The approaches to the city had been obstructed by sunken vessels and a double row of piles in the river. Four miles below the city, on the southern side of the river, and opposite the obstruction in the stream, was Fort Thompson, mounting 13 heavy guns. From the fort inland was a line of rifle-pits and redoubts extending about two miles to and beyond the Atlantic and North Carolina Railroad, and terminating on almost impassable ground. In the fort and on this line were 41 heavy guns and 19 field-pieces. The position was held by seven North Carolina regiments, a battalion of militia, and three batteries of artillery, numbering in all some 5,000 men, under command of Gen. L. O'B. Branch. Burnside's troops, 13 regiments of infantry, about 9,000 men, and 8 guns, were landed by noon of the 13th, and after a hard march in rain and deep mud bivouacked near the Confederate position, the naval vessels, under Commodore Rowan, moving up the river abreast of the infantry, and shelling the road and woods in advance. On the morning of the 14th the attack was made. Gen. J. G. Foster, with the 10th Connecticut and the 23d, 24th, and 28th Massachusetts, moved up a country road on the right; Gen. J. L. Reno on the left, with the 21st Massachusetts, 9th New Jersey, 51st New York, and 51st Pennsylvania, moved along the line of the railroad; while Gen. J. G. Parke, with the 4th and 5th Rhode Island and 11th Connecticut, moved in the centre, on a country road, as a reserve. Foster began the battle about 8 A.M. by an attack on Fort Thompson and the line near it, maintained the brunt of the contest for some time, and was reinforced by Parke. Meanwhile Reno had gained ground on the left, the entire division now became engaged, and the Confederates, after a resistance of four hours, broke and retreated to Newbern, burning behind them the railroad and turnpike bridges over Trent River. Burnside followed, crossed the Trent in boats, Branch retreating, and in the afternoon the Union troops occupied the city, capturing many heavy guns and other material. The Union loss was 90 killed, and 380 wounded. The Confederate loss was 64 killed, 101 wounded, and 413 captured or missing.

Confederate Efforts to Recapture Newbern.—The fall of Newbern was a serious blow to the Confederates, but the necessities of the army in Virginia forbade attempt to regain it until after the close of the campaigns of 1862, when troops were sent to North Carolina, and 13 March 1863, Gen. D. H. Hill, who had been assigned to the command in the State, organized an expedition for its recapture. Gen. Daniel's brigade moved from Kinston toward Newbern by the lower Trent road; Gen. Robertson's cav-

alry brigade was sent by the upper Trent road; and Gen. Pettigrew, with five North Carolina regiments and 15 guns, was ordered to approach the city near Barrington's Ferry, north of the Neuse, to attack two small gunboats in the river, and capture Fort Anderson, an earthwork on the river, opposite the city, garrisoned by 300 men of the 92d New York. At Deep Gully, a few miles out of Newbern, Daniel attacked five companies of the 25th Massachusetts, supported by two guns, and drove them in, but advanced no farther, as Pettigrew had failed. That officer, at daylight of the 14th, appeared in front of Fort Anderson and demanded its surrender, which was refused, and Pettigrew opened fire from all his guns, and engaged the gunboats Hetzel and Hunchback, which had been towed into position. The fire of the gunboats, with that of five guns of a battery of rifled guns from the other side of the Neuse, caused Pettigrew to withdraw and cover the movement of the 85th New York to reinforce the 92d. The casualties on either side were insignificant.

On 20 January 1864, Gen. Lee ordered Gen. Pickett, then at Petersburg, Va., to capture Newbern if upon examination he found it practicable, and authorized him to use four brigades of his command for the purpose, in addition to which he promised to assist him with Hoke's brigade of the Army of Northern Virginia. He gave detailed instructions for the movement, and all the Confederate forces in eastern North Carolina were to co-operate and retake Newbern, Plymouth, Washington, and other coast towns. On the morning of 30 January the movement began from Kinston in three columns; Gen. Barton, with his own brigade, Kemper's, part of Ransom's, 14 guns, and 600 cavalry, was directed to cross the Trent, take the works in front of Newbern in reverse, and cut off communication with the place. Col. Dearing was sent north of the Neuse with a cavalry force, two infantry regiments, and three guns, to attack Fort Anderson. Col. J. T. Wood, with picked crews in boats, was to descend the Neuse, seize the Union gunboats, and co-operate with Dearing in the attack on Fort Anderson. Gen. Pickett, with Hoke's brigade, three regiments of Corse's, two of Clingman's, and 10 guns, was to advance by the Dover road. Newbern had been strongly fortified, and was held by 2,000 men, under Gen. I. N. Palmer, and three gunboats were stationed in the Neuse and Trent rivers. An outpost of 300 men of the 132d New York was at Bachelor's Creek, eight miles above Newbern. Gen. Hoke, advancing by the Dover road, on 1 February, at Bachelor's Creek encountered the Union outpost, which was driven in after a severe Federal loss, and Pickett with his column crossed the creek and advanced toward Newbern. The batteries opened upon him; he made no attack, but awaited the result of the co-operating movements. Col. Wood, with 10 rowboats, carrying picked crews of 15 men each, armed with rifles and cutlasses, left Kinston at noon of 31 January, dropped down the river, and at 4 A.M. of 1 February arrived near the town; but, owing to a fog, he could not locate the position of the gunboats. He finally located the Underwriter, moored close in shore, near the wharf, and not more than 100 yards from three

NEWBERRY—NEWBURGH

batteries; and at night he boarded her, killing her commander and some of the crew, and capturing a third of the remainder in a hand-to-hand conflict. The fires under the boilers of the vessel were very low, and in attempting to tow her out Wood was subjected to fire of artillery and infantry from the forts on shore, and therefore he set her on fire. Pickett waited for Barton's movement, which failed, and after a feeble demonstration he gave up the enterprise and withdrew to Kinston, after a loss of 45 killed and wounded. The Union loss was 326 killed, wounded, and missing.

The third attempt on Newbern was made by Gen. Hoke, who, after his capture of Plymouth, N. C. (q.v.), 20 April 1864, moved against the place and demanded its surrender, and on being refused began a siege. Hoke was recalled to Kinston, 5 May, and ordered to Petersburg, Va. Consult: 'Official Records,' Vol IX., XVIII., XXXIII., XXXVI., and The Century Company's 'Battles and Leaders of the Civil War,' Vol. I.

E. A. CARMAN.

Newberry, nû'bër-î, John Strong, American geologist: b. Windsor, Conn., 22 Dec. 1822; d. New Haven 7 Dec. 1892. His early life was passed chiefly in the Western Reserve, Ohio, and he was graduated at the Western Reserve College in 1846 and at the Cleveland Medical School in 1848. From 1851 to 1855 he practised medicine in Cleveland. He was assistant surgeon and geologist to the government expedition that explored the country between San Francisco and the Columbia River; also accompanied Lieut. Ives in his exploration of the Colorado River, and the expedition under Captain Macomb in its exploration from the Santa Fé to the junction of the Grand and Green rivers. His reports upon the scientific results of these expeditions brought him great credit in the scientific world. At the beginning of the Civil War he became attached to the Sanitary Commission, and later secretary of its Western department. He was afterward connected with the Smithsonian Institution, and with the Columbian University, Washington, and in 1866 was appointed professor of geology and paleontology at the Columbia College School of Mines, which post he retained till his death. Besides many special reports and parts of general reports, his writings include: 'The Rock Oils of Ohio' (1859); 'Catalogue of the Plants of Ohio' (1860); 'Iron Resources of the United States' (1874); 'The Structure and Relations of Dinichthys' (1875); 'Palaeozoic Fishes of North America' (1889); 'Later Extinct Floras' (1898); etc. He was especially conversant with the paleontology of the Carboniferous Era in America, and particularly with extinct fishes; and as a teacher he had great popularity and influence. He was among the early members of the National Academy of Sciences.

Newberry, S. C., town, county-seat of Newberry County; on the Atlantic Coast Line and the Southern R.R.'s; about 40 miles northwest of Columbia. It is in a region in which the cultivation of cotton is one of the chief industries. It has manufacturing establishments for cottonseed-oil, cotton goods, preparing cotton for shipment, coffins, fertilizers, and lumber products. It has considerable trade, chiefly in cotton products, fruit, and vegetables.

It has a fine court-house and city-hall, and is the seat of Newberry College, a coeducational institution founded in 1858 under the auspices of the Lutheran Church. The city owns and operates the electric-light plant and the waterworks. Pop. (1910) 5,028.

Newbery, nû'bër-î, John, English publisher and bookseller: b. Waltham Saint Lawrence, Berkshire, 1713; d. London 22 Dec. 1767. Going to London he began, in 1745, in Saint Paul's Churchyard, the publishing and selling of books. He also published 'The Universal Chronicle and Weekly Gazette,' in which Johnson's 'Idlers' appeared, and 'The Public Ledger,' in which Goldsmith's 'Citizen of the World' was printed. Newbery made a specialty of books for children, and published the 'Juvenile Library,' a choice collection of volumes, among which were 'Goody Two Shoes,' 'Tommy Trip and His Dog Growler,' and other surviving favorites. His intimate association with famous authors, the merits of his own work, and the reputation which he left for a spirit and life of benevolence combine to perpetuate an interest in Newbery's memory.

Newbolt, Henry John, English author: b. Bilston, Staffordshire, 6 June 1862. He was educated at Clifton and Oxford and was called to the bar of Lincoln's Inn in 1887. After practising his profession till 1899 he established the next year the London 'Monthly Review,' which he has since edited. He has published 'Taken from the Enemy,' a novel (1892); 'Mordred,' a tragedy (1895); 'Admirals All' (1897), verse; 'The Island Race' (1897); 'Stories from Froissart' (1899); 'Froissart in Britain' (1900); 'The Sailing of the Long-Ships' (1902).

Newbolt, William Charles Edmond, English Anglican clergyman and author: b. Somerton, Somerset, 14 Aug. 1844. He was educated at Oxford, was vicar of Dymock 1870-7, and of Malvern Link 1877-88. He was principal of the Theological School, Ely, 1887-90 and is a canon and chancellor of St. Paul's Cathedral. Among his published works are 'Counsels of Faith and Practice' (1883); 'The Prayer Book: its Voice and Teaching' (1889); 'The Dial of Prayer' (1901); 'Apostles of the Lord' (1901).

Newborn, a sect of Antinomians, which arose in the United States in the early part of the 18th century. Its founder was a German immigrant, named Mathias Bawmann (who died 1727). They held the doctrine of the deification of humanity by regeneration. They denied that the Bible was necessary for the illumination of Christians, and scoffed at the sacraments. They claimed that their regeneration or newbirth was brought about by dreams, apparitions and supernatural inspiration, and was like the new name written on the white stone and known only to him that receiveth it (Rev. ii. 17).

Newburgh, nû'bërg, N. Y., city in Orange County; on the west bank of the Hudson River, and on the Erie and the West Shore R. R.'s; 58 miles north of New York. The first settlement was made by emigrants from the Rhenish Palatinate, in the winter of 1708-9. They called the place, 'Palatine Parish by Quassaic.' The Germans were soon followed by emigrants from Great Britain, and in 1750 the English and Scotch were there in numbers sufficient to change the name to 'Parish of Newburgh' in

NEWBURGH ADDRESSES—NEWBURYPORT

memory of Newburgh, in Aberdeen County, Scotland. Before the Revolution the farmers from the river brought their produce here to be sent to market. The lumber trade was most important; ships were built for trade with the West Indies and London; and at one time whaling was an industry of Newburgh. The city occupies a prominent place in the history of the Revolution. It was Washington's headquarters from March 1782 until 18 Aug. 1783. The "Hasbrouck House," which Washington occupied in Newburgh, was purchased in 1849 by the State of New York, and is now used as a museum for Revolutionary and Colonial relics. It is in charge of a board of trustees who have had it restored as when Washington occupied it. While in Newburgh, Washington received the letter (see NICOLA, LEWIS) asking him to become king; here the army was disbanded, and from here the Newburgh Addresses (q.v.) were issued. In 1800 Newburgh was incorporated as a village, the third in the State. After its incorporation the enterprising inhabitants built turnpikes to the farming sections west of the village, and in this way secured the trade of the farmers in the vicinity. Until 1830 sailing vessels plied regularly between New York and Newburgh, but after that date steamboats were used. The opening of the Erie Canal diverted considerable trade from the village. The first general rowing regatta on the Hudson River was held here in 1837. Others followed in 1840, 1841, and 1842. The country around has many places of historical interest. (See NEW YORK.) It was granted a city charter in 1865.

The city, viewed from the Hudson River, presents a pleasing arrangement of terraced slopes, broad, clean streets, many trees, and beautiful buildings. It is about 310 feet above the river, or Newburgh Bay, as the river expansion here is called. It is in an agricultural region, the commercial centre of an extensive section and of a number of large industries. The chief manufactures are machine-shop products, plaster, cotton and woolen goods, felt hats, silk, leatherette, powder, paper, carpets, flour, lumber, foundry products, dairy products, overalls, and cigars. It has ship-yards, extensive coal, brick, and lumber yards. Large quantities of coal from Pennsylvania are brought here to be loaded in coasting vessels and barges. There are over 4,000 employees in the industrial establishments. On the northeast corner of the grounds surrounding the "Headquarters" is the "Tower of Victory," made of stone, 53 feet high, with four archways leading into an atrium, and stairways leading into a belvedere. It contains a bronze statue of Washington, copied by O'Donovan from Houdon's model. Other statues represent the soldiers in the War of the Revolution. A tablet bears an inscription telling that the monument was erected by the authority of the Congress of the United States and of the State of New York. It cost \$67,000. The block of brownstone near the entrance marks the grave of Uzal Knapp, the last survivor of Washington's Life Guard; died in 1856. Newburgh has the first free public library in the State, a hospital, orphanage, and Home for the Friendless. Its educational institutions are five large public schools, two large parish schools (R. C.), a free academy, Saint Patrick's Academy, and Mount Saint Mary's Academy. There are 25 churches,

one of them for colored people. The three banks and one trust company have a combined capital of \$1,370,000; the annual amount of business is about \$3,000,000. The revised charter of 1898 provides for a mayor and council. The mayor holds office two years, the council has 13 members. The board of education, almshouse commissioners, and water commissioners are chosen by popular vote; the city clerk is elected by the council, and other administrative officials are appointed by the mayor subject to the approval of the council. The city owns and operates the waterworks. Pop. (1890) 23,087; (1900) 24,943; (1910) 27,803. Consult: Ingersoll, 'Handy Guide to Hudson River'; Nutt, 'Newburgh: Her Institutions, Industries, and Leading Citizens' (1891); Rittenber, 'Town of Newburgh'; Powell, 'Historic Towns of the Middle States.'

FREDERICK W. WILSON,

Editor 'Newburgh Daily News.'

Newburgh Addresses, in American history, a term applied to two anonymous letters, appearing in 1783, after the close of the Revolution. They were written upon behalf of the American soldiers whose pay had been withheld. It was afterward made known that General John Armstrong was the author of the letters.

Newburgh Sedition, in American history; while Gen. Washington had his headquarters in Newburgh, on the Hudson, December 1782, great dissatisfaction manifested itself among his officers, and they addressed a memorial or "round robin" to Congress, demanding their back pay, and security for future services. Congress refused to grant the demands, and in the following March an attempt was made to inaugurate a revolt. The matter became so serious that Washington appeared before a meeting of the malcontents and delivered such a patriotic address that the spirit of insubordination immediately disappeared.

Newburyport, nû"bûr-i-pôrt', Mass., city and one of the county-seats of Essex County, on the Merrimac River, three miles from the sea, 35 miles northeast of Boston and on the Boston & Maine railroad. It extends for about three miles along the bank of the river, but the streets leading back from the river are short; High Street, the principal residence street, lies parallel with the river, and State Street, the chief business street, is perpendicular to it. In the upper part of the city the river is crossed by a chain bridge (built 1792), the first suspension bridge in America. Among the notable buildings are the Putnam High School, the Anna Jacques Hospital, the Y. M. C. A. Memorial Building, the Old South Church, which contains the remains of George Whitfield, and the public library, formerly the old Tracy mansion, where Washington and Lafayette were entertained; the library contains about 40,000 volumes. The house in which William Lloyd Garrison was born is also in the city. In the days of wooden sailing vessels, the chief industry of Newburyport was shipbuilding, and many of the most famous clipper ships were built there; some small vessels are still built. The harbor is good, but access to it difficult on account of the shifting sand bar at the mouth of the river; there is a considerable trade in coal brought to the city by coasting schooners. The more important industries now include boot and shoe factories, cotton fac-

NEWCASTLE

tories, hat shops, an iron foundry, and a silver factory. The mayor, city council and board of aldermen are elected annually. The city owns and operates its waterworks, which were bought from a private company after considerable litigation. Newburyport was settled about 1635, separated from the town of Newbury in 1764, and chartered as a city in 1851. It sent a large quota of troops to the Civil War, and many of its citizens, who were sea-captains, received money from the Alabama claims. Pop. (1910) 14,949.

Newcastle, Margaret, DUCHESS OF. See CAVENTISH, MARGARET.

Newcastle, Thomas Pelham Holles, 1ST DUKE OF, English prime minister: b. England, 1693; d. August 1768. He was the son and heir of the 1st Lord Pelham and as one of the largest land-owners in England his influence, which he used freely in the service of the king, won favor at court and he was made Duke of Newcastle in 1714. He was appointed secretary of state in 1724, under Walpole, and though not a man of brilliant ability held this post until he became prime minister in 1754. He retired in 1756, but was recalled in 1757 and formed the ministry so notable because of the brilliancy of Pitt. He again resigned in 1762, and afterward lived a retired life with the exception of holding for a few months in 1763 the office of Lord Privy Seal.

Newcastle, William Cavendish, DUKE OF. See CAVENTISH, WILLIAM, DUKE OF NEWCASTLE.

Newcastle, Del., city in New Castle County: on the Delaware River, and on the Philadelphia, B. & W., and the Philadelphia & R. R.'s; about seven miles south of Wilmington. It was settled, in 1640, by Swedes. Later it was occupied by the Dutch and then by the English. In 1876 it was incorporated. Newcastle was the place where, in 1682, William Penn landed in America. It is in an agricultural region where much attention is given to fruit orchards and market gardens. Its good harbor, regular steamer connection with large cities, and railroad facilities make it an excellent shipping point for farm products, fruit, and vegetables. Considerable fish, especially shad, are caught in the nearby waters. Its chief manufactures are flour, brick, canned goods, woolen and cotton goods, iron products, and men's under-clothing. Newcastle has a library founded in 1812, several buildings dating back to Colonial times, and a number of fine modern houses. Pop. (1910) 3,351.

Newcastle, Ind., town, county-seat of Henry County: on the Blue River, and on the Pittsburgh, C., C. & St. L., the Cleveland, C., C. & St. L., and the Lake Erie & W. R.R.'s; about 40 miles northeast of Indianapolis. It is in a fertile agricultural and also a manufacturing region. The chief manufactures are agricultural implements, flour, paper boxes, iron and steel products, bridge works, pianos, brass furniture, carriages, brick, and furniture. It has natural gas, good water-power, and excellent transportation facilities. The city owns and operates the street-lighting plant and the waterworks. Pop. (1910) 9,446.

Newcastle, Pa., city and county-seat of Lawrence County; situated about 50 miles north of Pittsburgh, at the confluence of the Shenango, the Neshannock, and the Mahoning rivers, which there form the Beaver River, and on the Pennsylvania, the Baltimore & O., the Erie, the Pittsburgh & L. E., and the Buffalo & Pittsburgh R.R.'s. Branch roads also run into the city, the Erie & Ashtabula there splitting into the Youngstown & A., the Erie & Pittsburgh and the Western N. Y. and P., which latter is now under the control of the Pennsylvania. The city covers an area of 4,773 acres and, situated as it is in one of the richest and most charming valleys in the world, and having unequalled advantages of water power and railway facilities, it offers exceptional opportunities to the ever increasing population.

Industries.—Aside from being the commercial centre for a productive agricultural region, the city is in the heart of rich deposits of iron ore, limestone, coal, and clay, and is noted for its great variety of industries. The largest blast furnace, two of the largest tin plate mills, the largest cement works in the world, are located there, while according to population the city has relatively the largest freight tonnage in the United States, in 1903 reaching the total of 15,000,000 tons. The United States census of 1900 gives the following figures for the manufactures: number of establishments, 216; capital, \$13,308,220; average number of wage earners, 4,992; wages, \$3,226,669; cost of material used, \$13,646,648; value of products, \$21,046,842. Even since then the industries have grown enormously, as the following figures, compiled in 1904, will show: pig-iron, 950,000 tons; window glass, 14,000,000 square feet; muck bar, 26,600 tons; shelp, 39,125 tons; brick, 30,000,000; stoves, ranges, etc., 15,000; bolts, nuts, etc., 180,000 tons; clay, 10,000 tons; limestone, 2,000,000 tons; asphalt block, 2,500,000; sand, 10,000 tons; sandstone, 150,000 tons; enamelled ware, 6,240,000 pieces, fine china to the value of \$500,000; artificial ice, 90,000 tons; wire novelties, 150 tons; finished lumber, 15,500,000 feet; coal, 1,000,000 tons; while the value of the iron and steel output alone is about \$25,000,000. Among other manufactures are machinery, boilers, castings, blast furnace jackets, pottery and table ware, and vitreous sanitary ware. In these industries are employed 10,000 persons, of which the iron and steel mills and blast furnaces employ more than one-half.

Banks.—The city has six banks with a combined capital of \$1,225,000, deposits of \$7,000,000, and surplus of over \$1,650,000. One of the national banks ranks sixth in the list of national banks of the United States.

Public Buildings, Charitable Institutions, etc.—Prominent among the public buildings are the United States Government Building, containing the Post-office which has receipts of nearly \$18,000 and a net income of over \$9,000, the city hall, the opera house, and the Y. M. C. A. building, containing a large library, presented by Ira D. Sankey the evangelist. The Shenango Valley Hospital and the Almira Home for Aged Women are located there.

Churches and Educational Institutions.—The inhabitants of the city worship in 35 church edifices representing nearly all denominations. The educational advantages are of the highest standard of excellence: the pupils are accommodated

NEWCASTLE-UPON-TYNE

and receive instructions in a high school supplemented with 13 graded public schools, while a well sustained business college prepares young men and women for commercial life. Besides these there are also several excellent parish schools.

The Press.—There are published in the city two daily and four weekly newspapers in English, beside one monthly. The Press Club, composed of "Knights of the Pencil" is one of Newcastle's popular organizations.

Public Works, Parks, etc.—Newcastle is the second city in Pennsylvania in the average of highways paved, and outranks all other cities of its size in the country in that respect; the public improvements have practically all been the outcome of the marvellous growth of the city within the last 10 years; during that time the electric railway system, operating over 20 miles of track and connecting with all the surrounding cities and towns, has been built; a complete system of arc lights has been introduced, the capacity of the water system trebled, and an excellent sewerage system constructed.

Cascade Park, an amusement resort, was established by the traction company. The Old Park Cemetery and the Graceland Cemeteries are the largest of the "cities of the dead."

History, Government, etc.—Newcastle was first settled in 1800 by Robert White; became a borough in 1869, and was chartered as a city in 1875. Under the revised charter of 1887 the affairs of the city are administered by a mayor, elected for a term of three years, and a council consisting of two legislative bodies, the Select Council of seven members, who confirm the appointments of heads of administrative departments made by the mayor, and the Common Council of 14 members. The city has also street, fire, police, health, and charities departments.

Of the population, Americans form the predominating element, with 25,000, followed by Welsh 5,000, Italian 2,000 and Polish 2,000. Pop. (1890) 11,600; (1900) 28,339; (1910) 36,280.

S. JAMES CALLAHAN,

Secretary Chamber of Commerce.

Newcastle-upon-Tyne, England, Geographical Description.—Newcastle-upon-Tyne is a parliamentary, municipal and royal borough, an episcopal city, and also a city and county of itself. It is a famous river port, assize and market town, and is a Poor Law Union of 11 parishes. It is on the northern bank of the Tyne, nine miles from its mouth. It is about 272 miles N.N.W. by rail from London, 124 miles S.E. from Edinburgh, and 143 N.N.E. from Manchester. It occupies the sides and summits of hills that rise steeply from the river. The ratable value of the city is £1,614,000.

Geological Formation.—Coal measures constitute the geological formation; and they stretch southwards to Ferry Hill, northwards to Chevington. It is to the coal trade indeed that Newcastle owes much of its wealth and fame. In 1239 it received a charter from Henry III. conferring the right of digging for coal in the neighborhood; and the proverb "carrying coals to Newcastle" is no less familiar than the old saying taking "owls to Athens."

Public Buildings.—The principal public build-

ings are the Moot Hall (built 1830—in it the assizes for the county of Northumberland are held); the Hancock Museum (containing the collection of the Newcastle Natural History Society, the collection of John Hancock the naturalist, and many drawings of birds, etc., by Thomas Bewick, the engraver); the Keep of the old Castle, once the New Castle upon the Tyne (this Keep, which is all that remains of the castle itself, took five years to build in Henry II's reign, and cost over £900—in those days a large sum); the Black Gate, at the entrance to the Castle yard (now used as a Museum for Roman and other antiquities). The Keep itself, long used in part as a prison ("where is kept the sons of Belial," as an old phrase has it) is now occupied by the Society of Antiquaries. Of other buildings there may be mentioned the Town Hall (little esteemed); the Old Assembly Room; the Guildhall (in which is the assize court of Newcastle), and below it, the Exchange; and the Grain Warehouse, on the Quayside, the machinery of which elevates, carries, weighs and distributes grain from a ship's hold to the storage floors at the rate of 60 to 80 tons an hour. Of the theatres the chief are the Tyne Theatre and the Theatre Royal.

Public Libraries.—(1.) The Central Lending Library was built in 1879-80. It incorporated the old Mechanics' Institute, and was built partly on the site of the Carlol Tower—one of the old towers of the town wall. It cost over £20,000 to make ready for opening. The Reference Library was opened by the Prince of Wales (now king Edward VII) in 1884. The two existing Branch Libraries were built and presented to the city by Sir W. H. Stephenson. Mr. Andrew Carnegie promised Benwell (before its incorporation with Newcastle) £4,000 for a library, and adheres to his intention since the incorporation. Total volumes in all departments 135,000. (2.) The library of the Lit. and Phil. (i. e. the Literary and Philosophical Society). This society was founded in 1793 and has been prominently associated with the intellectual life of the town. In 1825 the society had its first meeting in the new and permanent premises, of which the site and building had cost £13,756. Practically from the foundation of the society lectures were given, and a large library (70,000 vols.) had also grown up. In 1893 a destructive fire broke out during the night in which the centenary had been celebrated; £10,648-14-3 was received from the insurance company. (3.) Library of the Society of Antiquaries. (4.) Library of the Church Institute.

Art Galleries.—The Laing Art Gallery adjoins the Central Public Library. It was presented to the city in 1904 by Mr. Alexander Laing, and cost nearly £25,000. Exhibitions of pictures are also held from time to time in the Academy of Arts (Blackett street) and elsewhere.

Places of Worship.—The Cathedral Church of Saint Nicholas has a famous lantern tower, which was added by Robert de Rhodes about 1450, 100 years after the completion of the church. The tower has been copied elsewhere, but never equalled. Of late years extensive alterations and repairs (costing £21,400) have

NEWCASTLE-UPON-TYNE

been carried out in the cathedral. The clock weighs two tons, and is controlled from Greenwich. New peals of bells, 1892; the largest weighing 5 tons 18 cwt. Saint Andrew's is said to be the oldest church in Newcastle, but Saint John's disputes the claim. Saint Mary's Cathedral (Roman Catholic) was designed by Pugin; its charming spire was added in 1872. There are many other churches representing the various Protestant denominations.

Schools, Educational Institutions, etc.—Dame Allan's School, Saint Cuthbert's Grammar School (R. C.), Deaf and Dumb Institute, Northern Counties Orphanage, Church High School for Girls, Central High School, etc. The Royal Grammar School has just built a large and fully equipped new school. The Armstrong College was founded in 1871 by the University of Durham (to which it is affiliated) and the North of England Institute of Mining and Mechanical Engineers. The College of Medicine (also affiliated to the University of Durham) was built in 1887, and cost £31,000. Rutherford College, not affiliated to the University, was founded by the late Dr. Rutherford.

Other institutions or societies are the Mining Institute and Wood Memorial Hall (Neville Hall adjoining the Lit. and Phil.); Tyne Improvement Commission; River Tyne Port Sanitary Authority; North East Coast Institution of Engineers and Shipbuilders; Trinity House, etc.

Municipal Enterprises.—The chief municipal undertakings are the markets, the public libraries, fire brigade, electric tramways (the construction account a few months after the opening of the new system in 1902 was given as £673,337), baths and washhouses.

Parks, Hospitals, Bridges.—Town Moor (said to have been held by the burgesses from time immemorial) 927 acres; Leazes, 86 acres; other parks and recreation grounds, 270 acres. The old Royal Infirmary is near the Central Station. About 10 years ago it was proposed to build a new one to commemorate the Diamond Jubilee of Queen Victoria's reign. Over £300,000 have been contributed since then, and the new Royal Infirmary has been erected on the Leazes, close to the Armstrong College. It was opened by the King in July, 1906. Other hospitals, etc., are the Eye Infirmary, Fleming Memorial Hospital for Children, Hospital of Diseases of Throat and Ear, for Incurables, etc. The chief bridges over the Tyne are the High Level (built by Robert Stephenson, 1846-50, at a cost of nearly £500,000); the Redheugh (built 1871, renewed without interruption to traffic 1896-1900); the hydraulic swing bridge (built by Lord Armstrong at a cost of £233,000); and a new railway bridge (North Eastern Railway), opened by the King in July 1906. The Byker Bridge (built 1876 and widened recently without interruption to traffic) crosses the Ouseburn and serves foot and vehicular traffic; whilst a railway viaduct, just to the north of it carries the traffic of the N. E. R.

Industries and Manufactures.—The coal mines are now all outside the city boundaries. The most notable industries of Newcastle itself are engineering and shipbuilding. To them may be added the trade in lead, chains, and

anchors, the manufacture of cement, of steam winches and windlasses, of cordage and cable, paper, cranes, pumps, and electric machinery. The chemical trade, formerly active, has declined of late years. The chief imports are ales, wines, and spirits, box and bale goods, canvas, jute, hemp, clay, colonial produce, and wheat, grain, provisions, glass, lead, livestock, salt, slates, tallow, skins, esparto grass, timber, etc. The chief exports are coals, machinery, chemicals, manures, cement, manufactured iron, paints, tar, fire-bricks, fire-clay, etc. According to the Tyne Improvement Commissioners' Tables the total amount of coal and coke exported in 1905 (foreign and coastwise) was 16,455,557 tons; being an increase of 663,151 tons over that of the previous year. The total number of steam and sailing vessels which have paid Tyne piers dues during 1905 is 13,154 (of registered tonnage, 8,396,812 tons). In 1904 the number was 13,169 (of 8,192,856 tonnage).

History.—The town (first called Pons Ælij then Novocastra, then Monkchester, then Newcastle-upon-Tyne) is situated near the eastern termination of the Wall of Hadrian, and Roman antiquities have been repeatedly discovered in it. In the Anglo-Saxon period it was a monastic centre. The fortress was built by Robert, son of William the Conqueror, about 1080. It was rebuilt by William Rufus, his younger brother, who "buyldeid the Newcastle upon the Tyne, the Scotts for to gaynstande and to defende." About this time the town received its present name. It received a charter from King John, but the oldest extant is said to be by Henry III in 1239, which confers the right of digging for coal in the neighborhood. The coal trade had attained some importance by 1280. Newcastle was a frequent object of attack, and was repeatedly taken in the wars between England and Scotland. It furnished 17 ships to Edward III for the siege of Calais. It was taken by the Scottish Covenanting army in 1640 and in 1644, and in 1646 Charles was delivered here by the Scottish army to the parliamentary commissioners.

Government.—Lord Mayor, Sheriff, Council. In the City Council there are 19 aldermen and 57 councillors. Special departments of corporation work are carried on by the 24 committees and 62 sub-committees. In the year 1400 a royal charter created Newcastle a county in itself, and Newcastle's first sheriff was appointed in that year. In 1600 the great charter (confirming old privileges and adding new ones) was passed. In 1882 a royal charter created Newcastle a city. In 1906 it was made a royal borough.

Area and Population.—The area of the municipal borough is 8,453 acres; that of the parliamentary borough is 5,355 acres, this being the largest undivided constituency in the Kingdom. In 1904 the neighboring districts of Walker, Benwell and Fenham, and part of Kenton were incorporated. Pop. (1881) 146,000; (1891) 186,300; (1901) 214,800; (1906) 264,500.

Bibliography.—Bruce, 'Reid's Handbook to Newcastle' (1863, rev. ed. 1903); Gray, 'Chorographia' (1649, re-edited by Crawhall & Reid, 1884); Bourne, 'History of Newcastle' (1736); Brand, 'History of Newcastle' (1789); Mac-

BASIL ANDERTON,

Public Librarian, Newcastle-upon-Tyne.

Newcomb, nū'kom, Harry Turner, American statistician: b. Owosso, Mich., 4 Jan. 1867. He was graduated from the law department of Columbian University in 1891, and entered the offices of the Chicago, Milwaukee & St. Paul railroad in 1882. In 1895-9 he was chief of the transportation department of the division of statistics in the United States department of agriculture, and in 1899-1901 was expert chief of the division of agriculture for the United States census. In 1896-1901 he was lecturer on statistics at Columbian University, and in 1901-3 he was editor of the 'Railway World.' He has written: 'Railway Economics' (1898); 'The Postal Deficit' (1900); etc.

Newcomb, Simon, American astronomer: b. Wallace, N. S., 12 March 1835; d. Washington, D. C., 11 July 1900. He came to the United States in 1853 and taught in Maryland; computed on the 'Nautical Almanac' at Cambridge 1857, and was graduated from the Lawrence Scientific School at Harvard 1858. He was appointed professor of mathematics in the United States Navy in 1861 and assigned to duty at the Naval Observatory; negotiated contract for and supervised construction of the great telescope; was secretary of the transit of Venus commission (1871-82), and observed transit at the Cape of Good Hope in 1882. He also has directed several parties to observe eclipses beginning in 1860. From 1877-97 he was senior professor of mathematics and superintendent of the Nautical Almanac Office. He retired from active duty in the navy (1897) at the required age of 62, and has since devoted himself to both pure and popular science. He was professor in Johns Hopkins University 1884-93 and editor of the 'American Journal of Mathematics,' retiring in 1901. He is a member of the Royal Academies of Bavaria, Leyden, Upsal, Stockholm, Prussia, Brussels, Ireland, Rome, Lombardy, and New South Wales; of the Royal Society, the Royal Institution and Royal Astronomical Society of Great Britain, the Sociedad Astronomica de Mexico, the Königliche Gesellschaft der Wissenschaften (Göttingen), and the Russian Astronomical Society; he is also associate fellow American Academy Arts and Sciences (St. Petersburg), and member of the Philadelphia Society, of the University of the State of New York (1897), Encouragement of Commerce (London), and corresponding member of the Institute of the American Republics. He is a member of the American Academy of Honor. He has been a member of the American Economic Club,

of the American Association for the Advancement of Science (1887), of the Society for Psychical Research (1885-6), of the American Mathematical Society (1897-8), of the Astronomical and Astrophysical Society of America since its foundation in 1899; vice-president of the National Academy of Sciences (1883-9) and its foreign secretary (1903). He was president of the International Congress of Arts and Sciences at St. Louis (1904). He has received the Royal Astronomical Society medal (1874), the Huygens medal (1878), the Copley medal of the Royal Society (1890), the Bruce medal of the Astronomical Society of the Pacific (1898), the Schubert prize from Russia, two bronze vases from Tokyo University, vases from the Imperial Observatory of Russia, and the Sylvester medal from Johns Hopkins. In 1887 the Russian government ordered his portrait for the Royal Observatory, and in 1897 it was painted for the Johns Hopkins. Among his degrees are: LL.D. from Columbia 1874, Yale 1875; Harvard 1884; Columbia 1887; Edinburgh 1891; Glasgow and Princeton 1896; Cracow 1900; Johns Hopkins 1902; Sc.D. Heidelberg 1886; Padua and Dublin 1892; D.C.L., Oxford 1890; Dr. of Math. Christiania 1902; Master of Mathematics and Dr. of Natural Philosophy, Leyden 1875; Dr. of Science, Cambridge 1896.

He has lectured at Harvard, the Lowell Institute at Boston, etc., and has delivered opening addresses at the Flower, Yerkes, and other observatories. In connection with his work on Mathematical Astronomy, besides over 100 papers published in various scientific journals, he has written large works 'On the Secular Variations, and Mutual Relations of the Orbits of the Asteroids' (1860); 'An Investigation of the Orbit of Neptune' (1874); 'Researches on the Motion of the Moon' (1876); 'Theory of the Inequalities in the Motion of the Moon' (1894); 'Tables of Uranus'; 'Measure of the Velocity of Light' (1884); 'Uranian and Neptune System'; 'Astronomical Constants and Eclipse Tables.' He founded the Astronomical Papers of the American Ephemeris, and edited the first eight of this series, which contain his tables of the planets and of the stars now used by astronomers all over the world. Among his more popular writings are 'Popular Astronomy' (1878); 'School Astronomy'; 'Elements of Astronomy' (1900); 'Algebra Geometry'; 'Analytical Geometry'; 'Calculus'; 'Essentials of Trigonometry'; 'The Stars' (1901); 'Astronomy for Everybody' (1902); 'A B C of Finance'; 'A Plain Man's Talk on the Labor Question' (1886); 'Principles of Political Economy' (1887); 'His Wisdom the Defender' (1900); 'Reminiscences of an Astronomer' (1903).

Newcomb Memorial College for Women, New Orleans. See **TULANE UNIVERSITY**.

Newcomen, nū-kōm'ēn, Thomas, English inventor of the atmospheric steam pump: b. Dartmouth, Devonshire, February 1663; d. London August 1729. With the financial help of John Cawley he experimented on Savery's engine, patented 1698, and possibly had made previous study of the same problem at an earlier date. His improvement of Savery's engine consisted principally in separating boiler, pump, and condenser. Steam was let into a cylinder from below, and a piston above was thus forced up

so that a pump rod attached to it by a balance arm was driven downward; cold water was then introduced into the condensing cylinder, a vacuum was there formed, and the external atmospheric pressure drew the piston down into the cylinder, the pump rod being forced up by this action. Newcomen's engine is practically the modern type, which, however, has Watts' condenser; it was successfully used, notably for pumping water from mines. An engine after Newcomen's model built in 1745 is still in use in the mines of the Ashton Vale Iron Company near Bristol. See STEAM ENGINE.

Newcomes, nū'kūnz, *The*, a novel, by W. M. Thackeray, published in 1854. It presents a lifelike picture of English society in the first half of the 19th century, and excels in the presentation of individual types. In Colonel Newcome we are shown perhaps the most perfect type of a gentleman to be found in the whole range of fiction.

Newdigate (nū'digāt) *Prize*, a prize in Oxford University, annually awarded for an English poem. It was founded by Sir Roger Newdigate, Bart. (1719-1806), its value being \$110. Among the winners have been several well-known men, such as Ruskin, Matthew and Sir Edwin Arnold, John Addington Symonds, and W. H. Mallock.

Newel, in architecture, the central space or column round which the steps of a circular staircase are wound. When there is no central pillar the newel is said to be open. The term *newel post* is also used in this connection.

Newell, nē'el, Peter ("SHEAF HERSEY"), American illustrator and humorist; b. McDonough County, Illinois, 5 March 1862. He was educated at Bushnell, Ill., worked for a photographer, drew crayon portraits, studied in New York at the Art Students' League, and in the early nineties became famous for his whimsical illustrations to humorous books and for his own pictures with text, which appeared in various periodicals and were collected as 'Topsy and Turvy' (1893-4), 'Peter Newell's Pictures and Rhymes' (1899), etc. His later work with its striking use of flat tones, possibly traceable to Japanese influence, is to be seen in the illustrations to Lewis Carroll's 'Alice in Wonderland,' 'Alice in the Looking-Glass,' 'The Hunting of the Snark'; 'Mr. Munchausen'; 'Book of Clever Beasts'; etc.

Newell, Robert Henry, American humorist, whose pseudonym was "ORPHEUS C. KERR," that is "Office Seeker"; b. New York 13 Dec. 1836; d. Brooklyn 1 July 1901. He was educated in New York; became assistant editor of the 'Sunday Mercury' in 1859; for it wrote his first 'Orpheus C. Kerr papers,' which were continued in three volumes (1861-4), none possessing much deeper humor than the kind suggested by the title. He was a war correspondent of the New York Herald; acted as an editor of the New York World, then of the Daily Graphic, and later of the 'Hearth and Home,' which he left in 1876. In 1878 he began to suffer with writer's cramp and letter-blindness, from which he never recovered. Besides his humorous sketches Newell wrote: 'There Was

Once a Man,' an anti-Darwinian romance (1884); 'Avery Gishem' (1867); 'The Palace Beautiful' (1865), and 'Versatilities' (1871), both volumes of verse; 'The Cloven Foot,' an adaptation of 'Edwin Drood' (1870); and 'The Walking Doll,' a novel of New York life (1872).

Newell, William Wells, American folklorist; b. Cambridge, Mass., 24 Jan. 1839. He was graduated from Harvard in 1859 and from the Harvard Divinity School in 1863, and entered the Unitarian ministry, but retired from that profession to become a teacher and writer. He is secretary of the American Folk-Lore Society and in 1888-1900 edited the 'Journal of American Folk-Lore.' He has written 'Games and Songs of American Children' (1883; 2d ed., 1903); 'King Arthur and the Table Round' (1897); 'Sonnets and Madrigals of Michelangelo Buonarroti' (1900); 'Legend of the Holy Grail' (1902); 'Words for Music,' in verse, (2d ed., 1904); etc.

Newfoundland.—*Geography*.—Newfoundland, the tenth largest island in the world is situated on the east coast of North America, between latitude 46° 37' and 51° 39' N., and longitude 52° 35' and 59° 25' W. It occupies much the same geographical position in the new world as the British Isles do in the old. The colony lies generally in a more southern latitude than the British Isles. It is larger than Ireland, containing 40,200 square miles. It is divided from the continent on the southwest by Cabot Straits, about 50 miles wide, and on the northeast by the Straits of Belle Isle. It juts far out into the Atlantic and is the nearest American land to Europe, being only 1,690 miles from Ireland and 1,213 from New York.

Topographical Features.—On the east coast the land is high and looks very rocky and barren; on the west coast the character of the country changes completely after Cape Ray is passed. Instead of the stern, forbidding, mountainous aspect of the east and south coast the land is level, well timbered and fertile. An American artist has declared that the scenery of Bay of Islands on the Newfoundland west coast is the most picturesque in North America. The numerous river valleys are very beautiful, especially the Humber, Codroy, etc. Much of the interior is moorland and marsh, well wooded around the numerous lakes and rivers. Most of the good land lies in these alluvial valleys. The west has a finer climate and the land generally is superior to the soil of the eastern shore. In the interior there are many isolated peaks. The chain of mountains known as the Long Range extends from Cape Ray for about 100 miles into the interior. There is another high range of mountains near the centre of the island. The highest peak is a little over 2,000 feet. The Atlantic coast line of Newfoundland and the southern shore have noble inlets, bays, and harbors, admirably adapted for carrying on its great industry, the cod fishery.

Hydrography.—The peculiar feature of Newfoundland are the innumerable lakes, only two of which are large, Grand Lake and Red Indian Lake. Both are long and narrow, Grand Lake about 60 miles long and Red Indian Lake about 50; but neither is over 10 miles wide in any part.

NEWFOUNDLAND

Glover Island in Grand Lake is 52 miles long. The largest river in the island is the Exploits, which is navigable for about 50 miles from the mouth of its estuary. The Humber, Gander, Codroys, and Terra Nova rivers are all fine streams but of no value for navigation except by canoes.

Soil.—In many parts of the island there is very good land, especially in the Codroy Valley, Saint George's Bay and the Humber Valley. Deer Lake, Red Indian, Exploits arm and the River valley also contain good soil. Fine timber and good ground fit for cultivation surround both the Gander river and lake. There is also good agricultural land around Avalon Peninsula, Trinity Bay, S. W. Arm, Green Bay, Notre Dame Bay, some parts of White Bay, Mortier, Placentia, Bonavista and Saint Mary's Bays. There are thousands of acres of splendid grazing ground and fine pasture lands specially suitable for sheep.

Minerals.—Newfoundland is celebrated as a producer of copper and iron, copper from the well-known Tilt Cove mine, and iron, now the main supply of the Dominion and Nova Scotia Iron and Steel Company, from Bell Island. There are 40,000,000 tons in sight and it is shipped for about 25 cents a ton at Bell Island pier. Iron pyrites to the value of \$1,500,000 have been shipped to the United States from Pilley's Island mine. Iron of various kinds has been found in the north. Argentiferous galena occurs in Placentia Bay. Asbestos is common and mica. Gold is being worked on a small scale in White Bay and petroleum of excellent quality is now being pumped at Parsons' Pond on the west coast. Slate and marble are abundant. A large deposit of talc has been opened and an aerial tramway built to it near Manuel's Conception Bay. The head of the Geological Survey, Mr. Howley, declares that nearly every known mineral is to be found in the colony. The country is almost wholly unexplored and her great mineral treasures, especially her valuable coal deposits, have not yet been tested in an efficient way with the boring machine. They are an extension of the Cape Breton coal fields and extend nearly across the island from Codroy to Green Bay.

Climate.—The Summer climate of Newfoundland from June until October is delightful. There is plenty of sunshine but no extremes of heat, seldom higher than 70° in the shade. The Winter climate is not so severe as in Canada. Zero is only occasionally touched. The Spring is late and the weather variable, due to the influence of the Labrador current which brings along the ice. During the last 20 years the climate has improved and there is now no very heavy snowfall or intense frost before the end of November. The fog lies on the coast and only rarely comes in on the land.

Animal Life.—Newfoundland is the home of the woodland caribou. All the interior is one vast deer park where countless thousands of these fine animals range unmolested and unseen by man. Black bears, the grey wolf, now very scarce, the lynx, foxes, beavers and otters, are indigenous. The varying hare has been introduced and now swarm all over the island. The Arctic hare is a native as well as the willow grouse and ptarmigan. There are plenty of

snipe, ducks, and geese, but no woodcock. The rivers abound with salmon and trout; there are no predaceous fishes, such as pike or pickerel.

Agriculture.—The main business of the colony is the fishery. Agriculture is only an auxiliary. There are 131,000 acres under cultivation or in pasture. About 54,000 tons of hay are raised; 541,000 bushels of potatoes; 11,000 bushels of oats; 65,298 bushels of turnips. There are nearly 9,000 horses; 32,742 head of cattle; 78,025 sheep, and 34,547 pigs. About \$600,000 worth of agricultural product is imported into the Colony every year from the United States and Canada, all of which could be raised in the island. The farming around the capital is excellent. On the west coast, where the very best land is situated, it is still very primitive.

Lumbering.—This industry has been greatly increased by capitalists from Canada and New England. The chief woods are spruce, white and yellow pine, red pine, fir, juniper birch, witch hazel, aspen, and white maple.

Fisheries.—The great industry of Newfoundland is the fishery, which for the last few years has formed 79 per cent. of her exports. Their value for the year 1904 was \$9,785,807, and for the year 1905, \$9,974,275. The codfishery is the largest item of the island's productions amounting in 1904 to \$7,193,063, and in 1905 to \$7,358,648. Next in importance comes the seal fishery, producing in 1904, \$562,054 and in 1905, \$745,235. Canned lobster comes to about \$500,000, and the balance is made up of whale, seal, and cod oil. The codfishery, both in extent of area and in production, is the largest in the world. The most remarkable feature in this great industry is its stability and uniform success. As certain as seed time, and harvest, there come every year to the shores of Newfoundland the regular supply of the bait fishes in orderly sequence, herring, caplin, and squid and the voracious cod. The seal fishery is much more variable, some years being a complete failure, other years a great success. The industry was formerly prosecuted in sailing vessels, now it is carried on in 23 steamers.

The herring fishery is another large industry. The movements of the fish are sometimes very irregular and the year's catches variable, unlike the steady uniformity of the codfishery which has continued for over four centuries steadily productive. The Labrador herring, once so famous, is now a thing of the past. Owing to judicious protection, salmon are year by year increasing and every season an increasing number of anglers come to enjoy the sport, principally from the United States. See NEWFOUNDLAND, THE FRENCH SHORE QUESTION IN.

Manufactures.—Ship building is extensively carried on in the outports of the colony. There are also a very large number of saw mills, some very small and primitive, others on a large scale with all the best and most modern appliances. Nearly all the other manufactures are carried on at the capital, Saint Johns (q. v.).

Trade and Commerce.—The main import trade is done with Great Britain, United States, and Canada. In 1905 there was imported from the United Kingdom merchandise valued at \$2,654,908; from America, \$2,790,114, and from the Dominion of Canada, \$4,105,569. Trade with England is decreasing whilst business with the

NEWFOUNDLAND

States and Canada is on the increase as shown by the following table.

	1888-1899.	1899-1900, 1903-1904.
	Per cent.	Per cent.
United Kingdom.....	33.7	24.5
Canada.....	20.8	21.3
United States.....	24.5	21.4
Elsewhere.....	21.2	33.1
	100.0	100.0

The cause of this change is not far to seek. Whilst British capital has neglected Newfoundland, Canadians and Americans have been prompt to secure the advantages offered by the island's minerals and timber. They have realized that there are great possibilities in the colony. The exports of Newfoundland go principally to Brazil, the West Indies, Spain, Portugal, Italy and Greece, chiefly dry codfish. Sealskins, and oils go to the United States, England, and in small amounts to Canada. The iron ore goes to Canada, copper to England, and iron pyrites to the United States, each worth about \$500,000. Trade is steadily increasing, and the country is very prosperous.

The Revenue of the Colony is nearly all derived from the customs and is considerably in excess of the expenditure. For 1903-4 the imports amounted to \$9,448,664; the exports were \$10,381,807, and the revenue \$2,513,633. In 1904-5 the imports were \$10,279,293; exports \$10,669,342, and the revenue \$2,574,069. For the last five years the excess of exports over imports amounts to \$6,159,556, a considerable advantage to a population of 230,000, that has to import nearly all its food and clothing. The public debt amounts to \$22,745,809, principally incurred for railway construction and public works, and includes the municipal debt of Saint Johns.

Means of Communication.—A narrow gauge railway runs from Saint Johns to Port aux Basques, where it connects with Sydney, C. B., three times a week by the Steamer *Bruce*. There are also steamers running along the coast north and south. There are excellent main and branch roads. With some of the northern outports and Labrador, communication in winter is maintained with difficulty by couriers. With the outside world, England, the United States, and Canada there are several lines of steamers all mentioned under the head of Saint Johns (q. v.).

Education.—This is conducted on purely denominational lines, each sect controlling its own educational money. Even the Salvation Army has its separate schools. In the capital and larger communities it works fairly well. The colleges and high schools are very efficient. In the smaller places this system of division is ruinous to good instruction. Its very worst effect is seen on some of the small islands where it actually destroys education.

Religion.—The principal denominations are the Church of England, Wesleyan, and Roman Catholic. The census shows 73,068 Anglicans; 75,080 Roman Catholics, and 61,388 Wesleyans; all other sects 10,599, with 3,947 persons residing at Labrador.

Government.—The government consists of the Governor, appointed by the Crown, a legislative council of 15 members, also appointed by the Crown for life, and a House of Assembly, consisting of 36 members, elected every four years on a manhood suffrage from 18 districts. The only town in the Colony that possesses municipal government is the capital, Saint Johns (q. v.).

Population and Principal Towns.—In 1901 the population of Newfoundland was 217,037, of its dependency, Labrador, 3,947. The inhabitants are chiefly of Anglo-Saxon and Irish descent. Outside of the capital there are no other large centres of population. The largest is Harbour Grace in Conception Bay, with 5,184 population; Bonaville, 3,696; Twillingate, 3,542; Carbonear, 3,703; Burin, 2,719; Bay Roberts, 2,226.

History.—The early history of the Colony involves the story of the discovery of North America by John Cabot in 1497, a memorable voyage fraught with far reaching consequences to the world, as it gave this great continent to the English by the indefeasible right of discovery. The immediate result of the discovery was the springing up of a great Trans-Atlantic codfishery which first drew Britons from the narrow seas, made them a nation of sailors, and laid the foundation of the British Colonial Empire. For a long time this industry was carried on secretly to avoid the exaction and tyranny of the Crown. There was not only a great fishery but a big barter trade in operation between the English and foreign sailors. By the reign of Elizabeth this business carried on by Devonshire men had grown so extensive that Raleigh declared it was the mainstay of the Western Countries then the chief maritime centre of England. The story of Newfoundland naturally divides itself into four periods. First, the early period from 1497 to 1610 when there was neither law, religion, or government in the island. English and foreign fishermen were ruled in a rough way by the valiant men of Devon, traders and pirates. Second, the fishing admiral period, 1610 to 1711, a time of struggle between the settlers and the ship fishermen from England. The permanent inhabitants were very much aided by their colonial brethren from the American Colonies. Trade began with them in 1641 and so increased that by the time of the Revolution it amounted to \$4,000,000. One of the largest items in this trade was the supply of New England rum. Thousands of Devonshire men were smuggled away every year to New England and thus helped to build up the trade and fisheries of the American Colonies which became so formidable as to rival England and excited the great admiration of Edmund Burke. Third, from 1711 to 1825 when the island was under naval Governors and at last possessed a resident ruler and a form of settled administration. Fourth, the modern period from 1825 up to the present time. When first the Colony was discovered it was inhabited by a branch of the great Algonquin family of Indians known amongst themselves as the "Beothics." Their principal settlement was in the interior around Red Indian Lake. They became extinct early in the last century. Misunderstandings arose between them and the white men and the feud ended in the dire disaster to the aborigines.

NEWFOUNDLAND

Starvation and disease combined with the dire hostility of the Mic-Macshricmac who early obtained the use of fire arms helped to destroy this interesting race.

The modern period can only be very briefly sketched. The Colony suffered severely from the policy of the Home Government which opposed settlement and tried by every means to use the island simply as a fishing station for British fishermen. No grants of land were issued until 1813. After the country obtained a local government in 1832 and full responsible government in 1855, it went ahead fast. The most wonderful feature in our Colonial history is the marvelous recuperative power of the insular population,—under the direct calamities, invasions from the French, fires, and lastly in 1892 a conflagration, which consumed half the Capital, followed in 1894 by a bank crash which financially ruined nearly every one in the island. The real advance of Newfoundland may be dated from the advent of the railway in 1881, since built right across the island, and giving us regular tri-weekly communication with the United States and Canada. The movement was bitterly opposed by the fish merchants and others but every one now recognizes its beneficial results in building up new industries. The present executive, the Bond Government, has an overwhelming majority and is doing good honest work for the island. The French shore question (q. v.) is now happily settled and it is hoped that fishery dispute with the United States will also be satisfactorily solved at an early date.

D. W. PAOWSZ,

Author of 'The History of Newfoundland from the Records.'

Newfoundland, The Atlantic Fisheries Dispute. This fertile source of friction between the United States and Great Britain antedates the War of Independence. In those times the American colonists, as fellow-subjects of England, prosecuted the fisheries of the Grand Banks and Saint Lawrence Gulf on equal terms with the inhabitants of Canada and Newfoundland. During the Revolution the Americans could not exercise it, but by the Treaty of 1783 they regained this liberty. The War of 1812 abrogated it again, and seizures of their vessels for attempting to prosecute the industry brought about the Convention of 1818, which fixes the status of the question at present.

The agreement of 1818 known in diplomacy as the Convention of Ghent, is somewhat remarkable. The American Commissioners claimed that they still possessed the privileges formerly enjoyed by them as British colonists although war had intervened and they had become an independent nation. The audacity of the claim startled the English Government, who answered that it was preposterous. The Americans were bold and insistent, they had many friends—and as every one desired peace and harmony the convention finally agreed on a compromise on the question. The British Government were ignorant both of the geography and the trade of Newfoundland and they considered the fishing rights they were giving away as practically valueless.

By this treaty the United States abandoned all claims to fishing within the territorial waters of the British North American possessions else-

where, in return for the right to catch fish inshore on the southwest coast of Newfoundland, between Ramea Isles and Cape Ray; on the west coast, between Cape Ray and Quirpon Isles. On the coast of Labrador, from Mont Joli, opposite Anticosti, eastward and northward indefinitely; and on the shores of the Magdalen Islands, with the further privilege of landing to dry and cure their catch on the unsettled portions of the southwest coast of Newfoundland and along Labrador.

Differences as to the extent of the territorial jurisdiction and the interpretation of the Treaty made the question one of serious menace to Anglo-American amity, owing to the vigorous stand taken by Canada (including Newfoundland) against the American fishermen, until 1854, when by a reciprocity treaty the Canadian fishery products were granted free entry into the United States. This accord was abrogated by Congress in 1866, the Convention of 1818 being reverted to. At once friction revived, and in 1871 it became necessary to conclude the "Washington Treaty," which embraced a series of articles dealing with the fishery problem. They provided for reciprocal fishing concessions in Canadian waters, and in American waters north of lat. 36°, but as Canada claimed that America secured the more valuable privileges an arbitration to dispose of this point was agreed upon. The fishery articles became operative 1 July 1873, the arbitration was held at Halifax (Nova Scotia) in 1877, and the tribunal, presided over by M. De la Fosse, Belgian Minister at Washington, awarded Canada \$5,500,000, of which \$1,000,000 went to Newfoundland. Congress abrogated the "fishery articles" in 1885, and again the Convention of 1818 governed this entanglement with the result of further trouble, so that in 1888 another fishery treaty, on similar lines to its predecessors, was arranged between the plenipotentiaries, Secretary Bayard and Mr. Chamberlain, only to be rejected by the United States Senate.

At this point Newfoundland and Canada parted company, so far as their attitude toward the United States was concerned. A *modus vivendi* for two years, to admit of the treaty being adequately considered by the Senate, had been arranged between the high contracting parties, granting American fisher-vessels, on payment of a license of \$1.50 per ship-ton, the right to enter the non-treaty waters of Canada and Newfoundland to purchase bait, ice, stores, and outfits, to transship cargoes, and to hire men. When the treaty was rejected, Newfoundland saw that fishery reciprocity between the United States and Canada was hopeless, and offered the former an accord on her own behalf. The proposal was accepted in 1890, when Secretary Blaine and Colonial Secretary (subsequently premier) Bond drafted the Bond-Blaine Convention, providing privileges for American fishermen in Newfoundland waters in return for free entry of Newfoundland fish into American markets.

When it was ready for ratification, Canada protested against it, claiming that Newfoundland should not be allowed to make such a compact without including the Dominion; and the British Government, to avert a collision between the greater colony and the smaller, pigeon-holed this draft till Canada should have had an oppor-

NEWFOUNDLAND

tunity to effect a similar understanding. But this she could not do, though the Conservative and Liberal Cabinets both sought terms from Washington, and as neither Canada nor Newfoundland dared abrogate the *modus vivendi* while hoping for a solution of the deadlock, the temporary arrangement continued year after year. In 1902 Canada withdrew her protest, and Sir Robert Bond revived the moribund draft, with Secretary Hay, the new one being known as the Bond-Hay Treaty, and containing improvements suggested by 12 years of discussion.

In 1904 the United States Senate "amended this to death," at the instance of the New England fishery interests, and then Newfoundland resolved to cancel the *modus vivendi*. This her Legislature did by an enactment in April 1905 excluding all American fishing vessels from her non-treaty waters, save for wood, water, shelter or repairs, privileges conceded by the Convention of 1818; and, as regards her treaty waters, restricting them to the mere rights that compact assured to them. The first effect was to hamper them in securing bait for their deep-sea fishing, for which Newfoundland is the natural base, because of its proximity to these shoals. The second was to partially destroy the winter herring fishery on the West Coast. Here they have treaty rights, but these are not ample enough to enable them to prosecute this industry successfully, as they need large numbers of coastfolk for netting and the use of the strand for salting or freezing the fish, and the residents were forbidden to work for, or sell to them; it being usual for the Americans previously, with the approval of the Colonial Government, to buy whole cargoes from the settlers who caught the fish. The withdrawal of these privileges seriously hampered the Americans and lessened their catch. They would, indeed, have fared even worse but that they succeeded in evading the Colonial Laws by inducing the coastfolk to proceed outside the three-mile limit and hire on board their ships there, returning then into territorial waters and serving as members of their crews.

This claim of the Americans to ship Newfoundlanders outside the three-mile limit and then return with them into port as legally part of their crew has not been confirmed at Washington. The State Department has discountenanced it and instructed the American fishermen that they may only bring into Newfoundland waters crews shipped in American ports.

Newfoundland, early in 1906, passed a further Act making it illegal for any of her people to leave her waters for such a purpose, or for any foreign fishing vessel to enter her waters with such men on board, while the Americans were also required to pay light dues, observe colonial fishery regulations and enter and clear at the custom-houses, which obligations they had declined to subscribe to since the rupture. On one of these questions the claim of the Newfoundland Government to compel all American vessels to enter and clear at the Custom House is unanswerable. All nations have an inherent right to protect their revenues from smuggling. The supply of goods aboard their schooners known as "the stop chest" is solely for this purpose. Canada has always compelled them to enter and clear their vessels when visiting Dominion ports and Newfoundland claims the same

right. The United States Government does not uphold its fishermen on this point. The payment of light dues rest upon the same basis. The most contentious question is, how far are the Americans bound to obey local fishery laws? Where these regulations are general and simply for the protection of the species from destruction, it would seem reasonable that they should be obeyed. One point on which there has been some friction lately is the right of the Americans to fish on Sunday. This irritates the Newfoundlanders more than anything else and caused the trouble years ago known as "the Fortune Bay Outrage." As grave international problems were involved in the whole question the British and American Governments opened negotiations for an adjustment of it, but this was not reached until 7 Sept. 1910.

Taken altogether the award was a victory for the United States. Neither British imperial or colonial authorities can compel American fishermen to report to the custom houses, nor can they impose upon these fishermen light, harbor, or other dues. Hereafter American fishermen can employ Newfoundlanders on their vessels, and they will also have the right to purchase supplies and enjoy other commercial privileges in Canadian ports. It was also specified by the tribunal that future disputes regarding fisheries regulations shall be adjusted by an impartial commission selected for that purpose.

Hon. Elihu Root was the chief pleader for the United States at The Hague, while Sir William Robinson appeared for Great Britain.

While the award was announced on 7 September, it did not become irrevocable until five days later, during which time either nation could have filed a protest. The fact that this was not done was held to be impressive testimony to the justice of the verdict.

P. T. McGRATH,

Editor 'The Evening Herald,' Saint John's, N. F.

Newfoundland, The French Shore Question in. The long-standing dispute between England and France about fishing rights in Newfoundland is generally known as "the French Shore question." Most writers begin its history with reference to the Treaty of Utrecht, 1713, when, by agreement between the two countries, certain privileges were given to the French on the west and northeast coast of Newfoundland. It really commences, however, with the defeat of the Invincible Armada. The extinction of Spain's naval power by that great victory left the two great powers face to face, and from this date begins the long duel between France and England for the command of the sea and the control of North America. The contest ended disastrously for France at the fall of Quebec and Trafalgar. Both her naval power and her great American Empire disappeared. All that now remained to her of New France were the two barren islets of Saint Pierre and Miquelon and the doubtful fishery rights in Newfoundland. It was the sentimental and national feeling involved in this dispute that made it so difficult to settle. The French claims are based on the Treaties of Utrecht, 1713, Versailles and Paris, the main basis being the first of these agreements. It begins with de-

NEWFOUNDLAND DOG—NEWGATE PRISON

claring that the island of Newfoundland shall belong of right wholly to Great Britain. Moreover, it shall not be lawful for the subjects of France to fortify any place in Newfoundland or to erect any buildings there, besides stages made of boards and huts necessary and useful for drying of fish, or to resort to the island beyond the time necessary for fishing and drying of fish. But it shall be allowed to the subjects of France to catch fish and to dry them on land, in that part only. The boundaries were first given between Cape Bonavista and Point Riche on the west coast, afterward altered to the last limits between Cape John and Cape Ray. By the Treaty of Paris (1763) Saint Pierre and Miquelon were given to France. By the Treaty of Versailles (1783) the last boundaries were settled, and there was a secret declaration made by George III. that the English were not to interrupt the French fishery by their competition. It was this last underhand clause, not made public in the Treaty, which has given rise to so much contention. The English government always claimed that it was a concurrent fishery. The French, and with right, argued that under this declaration their rights were exclusive—the French contention would have been unanswerable if they had been able to occupy the whole coast line, but, as a matter of fact, their business was solely confined to about a dozen stations. They encouraged English fishermen to settle near their establishments to take care of their property during their absence. As the French business on the coast declined the native settlers increased until they numbered 17,000, compared with the 300 Frenchmen. Difficulties and disputes between the rivals were constantly arising, and but for the tact and good management of the naval officers of both countries would have become acute. The highest authority on English foreign politics, Sir Charles Dilke, and Admiral Revilliere of the French navy declared it was "the most dangerous question between England and France." Carrying on this transatlantic fishery in rivalry with opponents who lived on the coast was utterly hopeless to the French. They were hampered with the burden of carrying on a business 2,000 miles from their base of supplies. Every season they had to bring out their men and gear from France, and in October to carry them all back again. No bounties could support such a hopeless undertaking. Up to the beginning of the last century the French carried on an immense business in Newfoundland as well as their Bank fishery from Saint Pierre, but gradually the Shore fishery declined until of late years it has come down to a dozen old brigs and about 300 men from France. Although bounty was piled on bounty and millions of francs were spent by the home government in trying to keep the business alive it went down and down. For a time after 1890 when by a "modus vivendi" the French were allowed to erect lobster factories, an added impetus was given to the industry. At that time 7,000 cases of lobsters, at \$11 and \$12 a case, were really worth more than their whole catch of cod. Eventually the lobsters became fished out. Since 1842, 20 commissions have sat upon the question, but no agreement could be arrived at. When the Anglo-French Convention was eventually agreed on, the most difficult subject of all was the French shore dispute,

but the great French Minister Delcassé rose to the occasion and made the nation actually believe that, although England was giving France a free hand in Morocco, territory in Africa, and valued gifts elsewhere, French fishery rights in Newfoundland still remained intact. As a matter of fact the old treaties have been annulled. All the French fishermen have been paid more than 10 times the value of their premises, boats, gear, etc., \$275,000, and since the agreement in 1904, and the arbitration about values, not a solitary Frenchman has ever returned to the French shore.

The French banking catch is about 419,748 lbs. In 1896 it was 734,124. The total catch of cod on the Treaty shore was last about 10,000 lbs., and of lobsters about 3,000 cases.

D. W. PROWSE,

Author of 'The History of Newfoundland from the Records.'

Newfoundland Dog. a large, handsome, long-haired, water-loving dog, originating in Newfoundland, probably from a cross between the native Indian sledge-dog and early imported European dogs, especially the pointer. The breed showed extraordinary retrieving powers, and was sent to Europe in so large numbers, and at so high prices, that it long ago became almost extinct in Newfoundland. It has, however, been maintained pure by various breeding kennels both in Great Britain and the United States. The Newfoundland is massive in appearance, the average weight for dogs being 100 pounds and for bitches 85 pounds. The head is broad and massive with flat skull and somewhat square muzzle and the ears are small and lie close to the head. The fore legs are straight and the hind legs capable of powerful action and the tail is carried gaily but not curled over. The hair is straight and very thick and in color is black, black and white, or bronze. For standard of points see Dog.

Newgate Prison.—At first marking the "New Gate" of the city of London, as far back as the beginning of the 12th Century, "New Gate" became Newgate prison and earned for itself a most unenviable reputation, which steadily grew worse throughout its career of nearly 700 years. The great fire of 1666 partially destroyed it. It was then renovated, to be reconstructed a century later. As late as 1850 prisoners were kept in herds like cattle, and no cleaner. Proper sanitation or even decent ventilation was unknown in Newgate even up to the date of its demolition in 1902 and no attempt at all was made to separate the sexes of the prisoners until the early part of the 19th century.

Prisoners arrested by the King's warrant were the first inhabitants of Newgate. Then came Jew child-murderers and debtors. Thieves and other criminals were in due course locked up there. If they could pay, they could secure luxuries. If they were poor, they had to beg even for food. Prisoners were tortured at Newgate in the days of religious persecution. Many of them stayed there for years and died there without ever having their cases heard in any court. Condemned criminals, during several reigns, were sent to Newgate, where Dick Turpin was incarcerated and others of his enterprising contemporaries.

NEWHALL-NEWMAN

Newhall, nū'hāl, Charles Steadman, American author: b. Boston, Mass., 4 Oct. 1842. He was graduated at Amherst in 1869 after serving in the Civil War and studied theology. He officiated as a clergyman for a time and later as a college professor, but became United States assistant special forest agent and is now (1907) superintendent of the forest reserves of northern and central California. He has written: 'History of Fall River' (1862); 'Ruthie's Story' (1888); 'Vines of Northeastern America' (1897); 'Fire and the U. S. Reserves' (1902); 'Joe and the Howards' (1869); 'Harry's Trip to the Orient' (1885); 'Trees of Northeastern America' (1890); 'Shrubs of Northeastern America' (1893); 'Sheep and the U. S. Reserves' (1901); 'Sunset, Lumbering and the U. S. Reserves' (1905); etc.

Newman, nū'man, Albert Henry, American Baptist clergyman and educator: b. Edgefield County, S. C., 25 Aug. 1852. He was graduated from Mercer University, Ga., in 1871, and from the Rochester Theological Seminary in 1875. He became a college professor, and in 1881-1901 filled the chair of church history at McMaster University, Toronto, Ont., and since 1901 has held a professorship at Baylor University, Waco, Texas. He has written: 'The Baptist Churches in the United States' (1894); 'A Century of Baptist Achievement' (1901); 'Manual of Church History' (1900-3); etc. He also translated and edited Immer's 'Hermeneutics of the New Testament' (1877).

Newman, Francis, English colonial governor in America: b. England about 1600; d. New Haven, Conn., 16 Nov. 1660. He emigrated to New Hampshire in 1638, settled later in New Haven and was one of the committee which waited upon Peter Stuyvesant to adjust the boundary question. In 1658 he became governor of the New Haven Colony, which office he held until his death.

Newman, Francis William, English scholar: b. London 27 June 1805; d. Weston-super-Mare, Somerset, 4 Oct. 1897. He was graduated from Worcester College, Oxford, in 1826; was fellow of Balliol in 1826-30; became professor of classical literature in Manchester New College in 1840; was professor of Latin at University College, London, in 1846-69, and was made principal of University Hall, London, in 1848. A brother of Cardinal Newman (q.v.), the thought and faith of the two wholly diverged. Francis made important contributions to the religious ideas of his time. His 'Phases of Faith' (1850), an autobiographical narrative of his religious changes, excited much controversy and was undoubtedly his best known writing; but 'The Soul. Its Sorrows and Aspirations' (1849) shows him at his best. In 1876 he joined the British and Foreign Unitarian Association, of which he became vice-president in 1879. His further writings are varied, treating of education, politics, religion, and social questions. An interesting experiment was his 'Himwatha Translated into Latin' (1862).

Newman, Henry Roderick, American painter: b. New York 1833. He was intended

for a physician, but abandoned medicine for art in his 18th year. Going to France in 1870 he made a tour of Switzerland and proceeded to Venice (1871), but eventually settled in Florence. He is pre-eminently a water color painter and his works consist principally of landscapes, and architectural views, among which may be mentioned 'Venice'; 'Tuscan Spring'; 'The Cathedral at Florence'; 'An Architectural Study.' He has also produced some clever flower and fruit pieces, including: 'A Study of Pink and White Oleanders'; 'Grapes and Olives'; and 'Flowers.'

Newman, John Henry, English author, theologian, preacher, and Cardinal in the Roman Catholic Church: b. London, England, 21 Feb. 1801; d. Edgbaston Oratory, Birmingham, England, 11 Aug. 1890. Newman was the eldest of six children of John Newman, a London banker, from whose family Newman inherited the taste for music which distinguished him. The family was of Dutch Jewish origin and had come to England in the latter part of the 17th century. Newman's mother, Jemima Fourdrinier, was of French Huguenot origin. From her he received a religious training of Calvinistic tendency, and was early brought up with a thorough knowledge of the Bible, which it is said he almost knew by heart. Newman, who was a precocious boy and wrote much verse and prose, describes himself in the 'Apologia' as an imaginative and superstitious child. From the writers who most influenced him in his youth—particularly Law and Thomas Scott—he obtained two important beliefs that clung to him through life, the idea of eternal punishment and a belief in the necessity of dogma. When about sixteen he became convinced that it was the will of God that he lead a single life.

Newman entered Trinity College, Oxford, in his 16th year, took his degree in 1820, and was elected a fellow of Oriel in 1822. Here he came under several distinct influences, which had a good deal of effect on his career. From Bishop Butler's 'Analogy,' which he read about this time, he gleaned the principles, which ever after characterized his work and on which he wrote much, that revealed religion as manifested in outward institutions is the symbol of the natural religion underlying—an idea that was in accord with his boyish dreams—and that 'probability is the guide of life.' The strong personal influences were Dr. Hawkins, Provost of Oriel, to whose teaching Newman says he owed the habit of caution in statement and the weighing of words, and, among other doctrines, that of the value of tradition; Dr. Whately, who for a time somewhat arrested Newman's spiritual growth and developed his reasoning power, and his intimate friends, John Keble and Hurrell Froude, spiritual enthusiasts and haters of liberalism. His studies for 'The Ariens of the Fourth Century' (pub. 1833) which he began at Oriel, tended to confirm his belief that 'Antiquity was the true exponent of the doctrines of Christianity and the basis of the Church of England,' and stimulated his innate belief in the existence of spirits, good and evil, which he regarded as the causes of physical phenomena. These studies also undoubtedly

laid the foundation for the course of reasoning which subsequently led him into the Church of Rome. Meanwhile, his progress in his profession had been rapid. In 1824 he took orders and was ordained curate of Saint Clement's Church, Oxford. The following year he became vice-principal of Alban Hall under Dr. Whately, a position which he gave up in 1826 to become tutor in Oriel. In 1828 he was made vicar of Saint Mary's, his only permanent position while a member of the Anglican Church; for in 1829 he broke with Whately because of his dislike for the tendency of the latter toward liberalism, and a year or two later retired from his tutorship at Oriel, for the reason that Dr. Hawkins, who then came into power, looked upon him and his friends, Keble and Froude, as too extreme in their views regarding the need of conformity to a more rigid order of things.

Through this period, Newman was gradually becoming alive to the conviction that he had a special mission to perform, and further stimulus was added by the French revolution of 1830 and the struggle in England which culminated in the Reform Bill of 1832. These tendencies toward liberalism he viewed with growing distrust. Not, however, till the close of his voyage with Froude to the south of Europe in the winter and spring of 1832-33 (during which he wrote many poems, including 'Lead Kindly Light') did the conviction become urgent. Taken so very ill in Sicily on his return voyage that his servant despaired of his life, he was nevertheless convinced that he should not die; he kept saying to himself 'We have work to do in England.' Hurrying thither as soon as his health permitted, he and his friends at once started the Oxford Movement (q.v.).

The object of this movement was in general the upholding of the ideal of primitive Christianity against the assaults of liberalism. It was pursued with great earnestness by Newman and his friends, Froude, Keble, Pusey, Rose, and others, and the means were the 'Tracts for the Times,' of which Newman was chief editor and author. He speaks of himself as occupying a modest position, but he was in reality the head of the movement. He himself held confidently to three principles which he endeavored to inculcate: the necessity of dogma in combatting liberalism; the existence of a visible church, "with sacraments and rites which are the channels of invisible grace"; and the belief that the Roman Catholic Church and the Pope were evil and anti-Christian. The first two of these beliefs he retained till the end of his life; it was in regard to the last that his views were completely altered and upon that belief his subsequent history turned. For Newman the Tractarian movement had two phases: up to 1839, he wrote in the spirit of full conviction and confidence; from then till the publication of the famous Tract 90 in 1841 there was a growing consciousness of the unsoundness of the arguments that he had been using against Catholicism. The chief task in the first period was the definition of the so-called 'Via Media' in which the Tractarians tried to establish the true position of the church between Romanism and Liberalism, to construct, in New-

man's words, "a possible road between a mountain and a morass, to be driven through formidable obstacles, if it is to exist, by the boldness and skill of the engineers." The principal book in which the doctrine is expounded is 'The Prophetic Office of the Church Viewed Relatively to Romanism and to Popular Protestantism' (1837). By 1839 the soundness of his position seemed to be established, but his studies had unconsciously to himself laid the train for the overthrow of what he had been advocating, and these doubts took shape the next two years. The argument from Antiquity with which he had supported the *Via Media*, turned out to be an equally good argument for the Catholic Church. He also made the discovery that there had in church history been *via medias* before; the various early sects of heretics had in his new view occupied much the same position as the Anglican Church. He was touched by the fact that the early fathers whom he invoked in support of his effort at true compromise would inevitably, if alive, have sided with Rome, and his imagination—always a strong influence in his reasoning—was haunted by the words, "Securus judicat orbis terrarum," which seemed to make nugatory all schism. The result was that he grew far less hostile to the Catholic Church, and with Tract 90 the movement against it came to an end. The main point of that tract was that the Thirty-nine Articles of the Anglican Church had originally been framed for political rather than religious purposes: they were designed to allow good Catholics to become members of the Anglican Church with mere loss of their allegiance to the Pope. If that was the case, then the Anglican had no better doctrinal support than the Roman Church.

From that time Newman regarded himself as practically dead to Anglicanism. In the storm of indignation which the tract evoked he did not, however, immediately retreat. Preferring to think the matter over carefully, he kept his living at Saint Mary's till 1843, and in that same year retracted the many hard things he had said about Rome. Two years later, in October, he entered the Roman Catholic Church, and early in 1846 left Oxford for good. After over a year in Rome (1846-47), he founded the Oratory of Saint Philip Neri, at Edgbaston, Birmingham, where he remained until his death.

Though condemned as an apostate by common Anglican consent, and though living a very secluded life, Newman almost at once benefited by the change. Not only did he feel the peace of security, but his literary genius is said to have ripened wonderfully. Heretofore he had written somewhat tentatively, as one groping; now he expressed himself with sureness and an unwonted command of expression. His writings during the first 18 years after his conversion, nearly all in support of Catholicism, include such various types as his 'Discourses Addressed to Mixed Congregations' (1849); 'Lectures on Anglican Difficulties' (1850), and 'Lectures on Catholicism in England' (1851); various of the essays collected in 'Historical Studies'; two novels 'Loss and Gain' (1848) and 'Callista' (1855); and what is in many respects his masterpiece of treatment, 'The Idea of a University,' a series of discourses

which he delivered at Dublin in 1852 on the founding of the Roman Catholic University.

In 1864 occurred the controversy with Kingsley, which marks an epoch in Newman's life and in the position of the Catholics in England. Kingsley had said that the Roman clergy had little regard for truth, and had cited Newman as an advocate of cunning. Newman naturally asked for his evidence. Kingsley, in *Macmillan's Magazine*, where his first article had appeared, replied that he had mistaken Newman's tone, and apologized. Newman, reasonably dissatisfied with Kingsley's failure to produce the specific evidence, published the whole correspondence. Kingsley thereupon replied in a vigorous pamphlet entitled "What, then, Does Dr. Newman Mean?" in which he charged Newman with equivocation and cited all the instances he could find in Newman's life and works to prove his point. The merits of the controversy are as yet unsettled, though now of only historical interest; views would probably still range from extreme support of Newman to such words as those of Huxley, "That man is the slipperiest sophist I have ever met with. Kingsley was entirely right about him." ("Letters," II, p. 240.) The effect of the controversy was the publication by Newman of the "Apologia pro Vita Sua." This, which appeared serially between 21 April and 2 June, gave the key to Newman's life as an internal state.

The effect of the "Apologia" was to temper in a great measure the feeling between the Catholics and the Anglicans, and it gave Newman the honorable position of peacemaker. From that time on he occupied a high place in England and received many dignities. In 1877 he was elected honorary fellow of Trinity College, Oxford, and two years later was created cardinal by Pope Leo XIII. Two works are to be especially noted, "An Essay in Aid of a Grammar of Assent" (1870), in which Newman attempted to expound systematically the logic of belief aside from exact proof; and "The Dream of Gerontius," written shortly after the "Apologia," in which he delineated in poetical form the yearning of a soul toward certitude and truth.

These three books indicate where the place and power of Newman lie. His position is probably to be determined not by his intellectual contributions but by his personality which is of a high, noble, and persuasive type, and which is expressed in a style of unsurpassed skill and delicacy. As a contributor of ideas and new truth, he is not so important. As a theologian, his life-long beliefs and teaching—that the world is controlled by the powers of darkness, that God is the only holy thing, that the Church is the only true revealer of God—in no wise differ from good Catholic opinion. The great argument on which he ultimately based all his claims, that of probability, that we act not from certainty but from states of certitude, that personality which can induce states of certitude is a better guide than strict reason—the basis of this he got from Bishop Butler, nor did he take into consideration the fact that his argument would allow anybody to believe anything at all, provided he could summon enough certitude in support of it. Doubtless the mass do the just such sanctions, and Newman has certainly, both in life

and in work, put the argument as well as it has ever been put, but the method is wholly opposed to scientific proof, and it is easy therein to see the reason for the view of such men as Huxley. The truth of the matter probably is that Newman, with all his training in logic, really had little regard for strict evidence; his course during the Oxford movement shows that he argued from predispositions and predilections, and his conversion was in part at least the result of evidence supplied solely by his imagination. But as a gracious and winning personality his place is of the highest, as is his power of expression.

Bibliography.—The chief sources of information are, among Newman's many works, the "Apologia," and "The Letters and Correspondence of J. H. Newman," edited by his sister, Mrs. Anne Mozley. Lives and studies are those of H. J. Jennings ("Cardinal Newman, The Story of His Life"); R. H. Hutton ("Cardinal Newman"); William Barry (in "Literary Lives"), but a good life in English is still a desideratum, for the simple reason that biographers are almost always slightly partisan, and because materials for a complete study are scattered in various books as Church's "The Oxford Movement," Mark Pattison's "Memoirs," Abbott's "Philomythus," and a score of others (see a long list in the "Dictionary of National Biography"). There is an excellent short study of the conversion and the theology of Newman by R. M. Lovett (*Harvard Monthly*, Dec. 1892, Jan. 1893).

WILLIAM T. BREWSTER,

Professor of English, Columbia University.

Newman, John Philip, American Methodist bishop: b. New York 1 Sept. 1806; d. Saratoga, N. Y., 5 July 1899. He studied for the ministry and in 1860 was ordained. He preached in New Orleans in 1864-9; in 1869-72 and in 1875-8 was pastor of the Metropolitan Methodist Church in Washington, D. C., and was chaplain of the Senate for three sessions. He was appointed by President Grant inspector of United States consulates in Asia in 1873, and in 1888 was elected bishop. He wrote: "From Dan to Beersheba" (1864); "The Thrones and Palaces of Babylon and Nineveh from the Persian Gulf to the Mediterranean" (1876); "Christianity Triumphant" (1884); "Evenings with the Prophets on the Lost Empires" (1887); "The Supremacy of the Law" (1890); "Conversations with Christ" (1901).

Newnan, nū'nān, Ga., city, county-seat of Coweta County; on the Central of Georgia and the Atlanta & W. P. R.R.'s; about 38 miles south by west of Atlanta. It is in a productive agricultural region in which cotton and fruits are extensively cultivated. The principal industrial establishments are cotton mills, cottonseed-oil mills, machine shops, flour mill, tannery, fertilizer works, a large plant for manufacturing boilers, engines, presses, and mill machinery, and an ice factory. The city owns the waterworks. Pop. (1910) 5,548.

Newnes, nūnz, Sm George, English journalist: b. England 13 March 1851; d. London, 9 June 1910. He was educated in London and entered journalism. He was owner of the

NEWNHAM COLLEGE—NEWPORT

Westminster Gazette and founder of "George Newnes, Limited," publishers, and proprietors of 'Strand Magazine,' 'Tid-Bits,' etc. He was knighted in 1895, and in 1900 became a member of Parliament for Swansea Town.

Newnham (nūn'am) College, England, an institution for the higher education of women at Cambridge, founded in 1871, and incorporated in 1880. No students are admitted under 18 years of age; the course of study corresponds with that of Cambridge University. There are a number of exhibitions and scholarships connected with the college, which is on the same lines as Girton (q.v.). The faculty numbers about fifteen, and there is an average attendance of over 160 students.

Newpore, Fort, a former Revolutionary fortification on Ward Creek, near Oneida Lake, New York.

Newport, nā'pōrt, Christopher, English sea captain: b. about 1565; d. 1618. In 1592 he commanded a ship in the West Indian expedition; sailed to Virginia in 1606, 1607 and 1609; was wrecked on the Bermudas in the latter voyage, but made his way to Virginia after many adventures recounted by Jourdain in the 'Discovery of the Bermudas,' which Shakespeare may have used in writing the 'Tempest'; and in 1612 entered the employ of the East India Company, for whom he made several very successful voyages.

Newport, George, English naturalist: b. Canterbury, England, 4 July 1803; d. London, England, 7 April 1854. He was educated at the London University and became a surgeon, but devoted much time to entomology, in which science he made valuable discoveries. He wrote: 'Observations on the Anatomy, Habits, and Economy of *Athalia Centifolia*' (1830); 'Catalogue of the Myriapoda in the British Museum' (1856); etc.

Newport, England, a town of Monmouthshire, on the Usk, 145 miles by rail west of London. It is an important river port communicating with the Bristol Channel. As one of the principal outlets for the produce of extensive collieries and iron and steel works in the vicinity, it has extensive dock accommodation covering over 80 acres. Its public buildings are all of modern erection, and include town hall, market hall, county offices, public baths, museum, and art gallery. Its most ancient buildings are the remains of a 12th century castle and the church of Saint Woollos.

Newport, Ky., city in Campbell County; at the confluence of the Ohio and Licking rivers; and on the Louisville & N. and the Chesapeake & O. R.R.'s. Cincinnati, on the Ohio, and Covington, on the Licking, are opposite Newport. The city was settled in 1791; in 1795 was incorporated, and, in 1850, was granted a city charter. It is a popular residential city for Cincinnati business men. It is in an agricultural region and farm products are among its most important shipments. The chief manufacturing establishments are cigar-box factory, cast and sheet iron works, carriage works, watch-case factory, and a furniture factory. It has large coal and brick yards and considerable river trade. Fort Thomas, a government military post, is on an elevation near the city. Some of the prominent buildings are the city-hall, court-

house, post-office, the banks, a Masonic Temple, the churches and schools, and the library. It is the seat of Mount Saint Martin's and Immaculate academies, and it has good public and parish schools and a public library. The city now has commission government. It was formerly under the charter of 1894, which provided for a mayor who held office for four years, and a council. The mayor appointed the police and firemen and the members of the water commission, and, subject to the approval of the aldermen, the superintendent of public works and the city auditor. The council elected the bridge commissioners. The board of education is elected by the people, and the members hold office two years. The waterworks is owned and operated by the municipality. Pop. (1910) 30,309.

Newport, N. H., town, county-seat of Sullivan County; on the Sugar River, and on the Boston & Maine railroad; about 35 miles in direct line northwest of Concord and 45 miles northwest of Manchester. It is in an agricultural and grazing region, and the good water-power contributes to its industrial prosperity. Its chief manufactures are woolen goods, agricultural implements, shoes, lumber and lumber products, clothing, and dairy products. It has a public library which contains (1904) about 8,000 volumes. Its scenery and climate make it a favorite summer resort. The city owns and operates the waterworks. Pop. (1900) 3,126; (1910) 3,765. Consult: Wheeler, 'The History of Newport.'

Newport, R. I., city, port of entry, county-seat of Newport County; in Rhode Island, on Narragansett Bay, and on the New York, N. H. & H. R.R.; about 30 miles south of Providence. It has daily steamer communications with Providence, New York, Fall River, and other ports. It is a famous summer resort, and in the season its facilities for transportation are much increased. Its beautiful scenery, equable climate, ease of access by land and water from New York, Boston, and other large cities, make it a favorite watering place. Its occupancy by people of great wealth, who have built summer residences costing millions of dollars, has made it fashionable and exclusive. In 1639 Newport was settled by Roger Williams; and later Anne Hutchinson and other refugees, who for religious convictions had been expelled from Massachusetts by the Puritans, came to Newport. At first Newport was independent in government, but in 1644 Roger Williams obtained a patent from the British Parliament under which all the colonies in what is now the State of Rhode Island were united under the name of 'The Incorporation of Providence Plantations in the Narragansett Bay in New England.' The charter gave much dissatisfaction and in 1663 was changed to a charter that continued in force until 1843. (See DOWN RIVER.) A public school was established in Newport in 1840. From the beginning the place was a trading port of importance; its commerce was greater than that of New York in 1769-70. One of the first acts of resistance against Great Britain took place at Newport when the British sloop Liberty was destroyed here, while engaged in enforcing obnoxious smuggling laws. The British took possession of Newport 6 Dec. 1776, and held it for two years. The shipping of

NEWPORT — NEWSPAPER

the place and the general trade were nearly destroyed during the Revolution. The British soldiers burned in all about 475 houses. In 1780 Rochambeau and his troops from France made Newport their headquarters. In 1784, the year after the Revolutionary War had closed, Newport was incorporated, but in 1786 it surrendered its charter, and was not re-incorporated for 77 years.

It is claimed by some historians that Newport, and other parts of the United States, were discovered by Northmen as early as the 11th century. The 'Old Stone Mill' in Touro Park is pointed out as a relic of the days of the Northmen; but it is now generally believed that this mill was built in the 17th century. Newport was one of the capitals of the State until 1900. Bishop Berkeley lived in Newport from 1729 to 1732 and here wrote his ode on Western progress, and part of his 'Alciphron.' William Ellery Channing and Commodore M. C. Perry were born in Newport. Some of the historic places are the State House built in 1742; the city-hall built in 1763; Redwood library, 1748; Trinity Church (P. E.), 1725; the headquarters of the British Army (Sayer House), in 1780. One of the oldest newspapers in the United States still in existence, is the *Newport Mercury*, established by James Franklin in 1758. The oldest part of the city is around the harbor; the modern part, with its magnificent mansions, surrounded by well-kept lawns, is toward the ocean. Overlooking and guarding the harbor are Fort Greble and Fort Adams. Some of the attractions other than those mentioned are the long beaches, the bathing places, the 'Hanging Rocks,' the 12-mile Ocean Drive, Purgatory (a rocky fissure 50 feet in depth), the Cliff Walk, and the Spouting Rock (when the water is disturbed by a storm it is forced through an opening in this rock). It has a United States torpedo station on Goat Island, and a United States Naval Training Station and War College on Coaster Harbor, also a naval hospital (1897). The city has many parks, fountains, and monuments which are works of art. It is the seat of Saint George's and Cloyne House schools and Saint Mary's Academy. A valuable collection of relics are in the Newport Historical Society building; there are several libraries, the People's, Redwood, and others.

It still has a large fish trade, but the city is now known for its society life, and its industries and commerce are of little value. Pop. (1900), 22,034. (1910) 27,149. Consult Brooks, 'The Controversy Touching the Stone Mill'; Greene, 'The Providence Plantation'; 'Newport in the Revolution,' an article in the 'New England Magazine'

Newport, Vt., village, county-seat of Orleans County; on Lake Memphremagog, and on the Boston & Maine and the Canadian Pacific R.R.'s; about 50 miles in direct line north by east of Montpelier. In the summer season it has regular steamer communication with all the villages and towns on the lake. It is a favorite summer resort on account of its climate, the scenery in the vicinity and the opportunities for fishing. Its trade is chiefly in farm products; its manufactures are principally to supply local wants. It has fine church and school buildings and the Goodrich Memorial Library which con-

tains (1904) about 7,000 volumes. Pop. (1890) 1,730; (1900) 1874; (1910) 2,548.

Newport News, Va., city and port of entry in Warwick County, on the James River and Hampton Roads, and at the terminus of the Chesapeake & Ohio railroad; situated 70 miles southeast of Richmond and 14 miles north of Norfolk. The city lies in the centre of a rich vegetable and fruit country. It is connected with Hampton and Old Point Comfort by electric railways. In the heart of the city facing the James River is Casino Park, which has become a popular resort.

Trade and Commerce.—With several foreign and coast lines of steamships sailing hence, and with a fine harbor and excellent shipping facilities, Newport News has very recently become an important port and the centre of large commercial interests. The foreign trade in 1901 amounted to \$36,658,000; the exports amounting to \$32,568,000. The foreign commerce of the port is largely carried on by the Chesapeake & Ohio Railroad and the United States Shipping Company, making direct connection with England and the continent. The city has become fourth in the United States in the shipment of grain. There are two national banks, each with a capital of \$100,000; six private banks, and several trust companies. The city has three weekly and four daily newspapers.

Manufactures.—Here is an extensive ship-building plant, giving employment to 7,000 workmen; two dry docks 600 and 900 feet long; two grain elevators with a capacity of 2,850,000 bushels; wood-working mills; ice factories, lumber mills, iron works, shoe factory, shirt factory, and brewery.

Government.—Newport News is governed, under its original charter of 1896, by a mayor, elected every four years, a common council, consisting of 16 members, and a board of eight aldermen. The city has an improved system of waterworks and electric light and gas plants.

Population.—Newport News is a young town practically lacking in history. It was first laid out in 1882 and incorporated in 1896. Its growth has been very rapid; the population in 1890 was 4,449; in 1900 it was 19,500, and 1910 20,205.

F. J. KING,

Secretary Newport News Chamber of Commerce.

News-Letter, a popular name applied to the printed sheets or letters issued weekly in the early part of the 17th century, the news for which was collected in the coffee houses. Originally they were literally letters of news written by professional newswriters, and sent by them to their employers weekly. Many early printed newspapers took *News-Letter* as a title, as the 'Boston Newsletter,' etc.

Newspaper, a daily or other printed paper containing news or intelligence of past, current, or coming events, together with comment, criticism, or discussion of such events by editors and contributors. The total number of newspapers published in the world at present is estimated at about 60,000, distributed as follows: United States and Canada, 26,360; Germany, 8,000; Great Britain, 8,000; France, 4,300; Japan, 2,000; Italy, 1,500; Austria-Hungary, 1,200; Asia (exclusive of Japan), 1,000; Spain, 850; Russia, 800; Australia, 1,000; Greece, 600; Switzerland, 450; Holland, 300; Belgium, 300;

NEWSPAPER

all others, 1,000. Of these more than half are printed in the English language. A detailed history of the newspaper in America will be found under **AMERICAN NEWSPAPERS**.

Early Roman Bulletin.—The newspaper had its origin several centuries before the Christian era. The Romans published the 'Acta Diurna', the 'Acta Publica', the 'Acta Senatus' and other journals. The 'Acta Diurna' was a bulletin in which accounts were given of the progress of the imperial army. The intelligence was communicated by the generals who received it from the officers under their command, and thus the contents became known throughout the army. The 'Acta Diurna', however, recorded other than military matters, such as trials, punishments, deaths, and sacrifices. The 'Acta Senatus' contained accounts of the various matters brought before the senate, the opinions of the chief speakers, and the decisions of the house, published regularly by command of Julius Caesar, as part of the government gazette. The 'Acta Publica' was a still nearer approach to the true newspaper form. During the later times of the republic, and under the empire, it was published daily at Rome by the authority of the government. It contained a register of the births and deaths in the city; an account of the money paid into the treasury, from the provinces, and everything relating to the supply of corn, and a kind of court circular, containing an account of the births, deaths, festivals, and movements of the imperial family. Such details of public affairs as it was deemed expedient to publish were also included in it. The speeches in the senate and the public assemblies were taken down by the early Roman short-hand writers called *actuarii*. These, assisted by clerks and notaries, drew up the 'Acta,' under the superintendence of censors, quaestors, and other magistrates. The publication consisted in posting them in some public place, that any one who pleased might read them.

First Printed Journals.—The *Peking Gazette* was probably the first printed newspaper, and is the oldest daily journal in the world. It was first issued about 1340 A.D. The *Gazette* is still in existence, and is an official journal, forming a pamphlet of 20 to 40 pages of coarse paper, printed from wooden types on one side only, and having a colored paper cover. Toward the close of the 15th century, soon after the invention of printing, small sheets, usually in the epistolary form, appeared in Augsburg, Vienna, Ratisbon, and Nuremberg. They were called 'Relationen' and the 'Neue Zeytung', and gave accounts of the discovery of America and of other important public events, and like modern newspapers they chronicled the more interesting and startling local incidents. The 'Notizie Scritte', published monthly in Venice, in 1562, is said to have been the first Italian newspaper. Its price was a small coin called *gazetta*; hence the word *gazette* which came to be the popular name for the modern newspaper. The war which Venice waged in *Dalmatia* gave rise in 1563 to the custom in Venice of having military and commercial information read at a particular place by those desirous to learn the news, who paid for this privilege. A file of these Venetian papers, covering a period of 60 years, is still

preserved in the *Magliabechi Library* at Florence.

English Newspapers.—A printed bulletin entitled 'Relations' was published in England as early as 1462, and in 1527 there was one called 'New Tidings', but neither of these presented more than a single piece of intelligence. A pamphlet called 'The Newes from Spaine' made its appearance in the reign of Queen Elizabeth in order to convey to the people the tidings of the approaching armada from Spain, and the various counter-movements on the part of the British army and fleet. A more pretentious journal was issued in 1622, under the title, 'The Weekly News from Italy, Germany, etc.' published by Nathaniel Buttes, Nicholas Bourne, and Thomas Archer, and this may be regarded as the first specimen of the regular newspaper in England. Numerous other news journals followed, but it was not till the beginning of the parliamentary wars that the newspaper first acquired political influence. One of these, published in November 1641, under the title of 'Diurnal Occurrences, or the Heads of Several Proceedings in both Houses of Parliament,' is noticeable as the first which furnished a report of the proceedings in Parliament. The other papers which followed this were the 'English Post,' 'England's Memorable Accidents,' 'The Kingdom's Weekly Intelligencer,' 'The Spy,' 'The Parliament's Scout,' 'The London Post,' 'The Country Messenger,' and were most of them published weekly. In Cromwell's time the principal journals were the 'Mercurius Politicus' and the 'Public Intelligencer.' The publication of newspapers without license was prohibited in the reign of Charles II., and an office was created called *Licensor of the Press*. Advertisements first appeared in English newspapers in 1652. The first copy of the 'London Gazette' was issued 7 Nov. 1665, at Oxford, whither the court had retired in consequence of the plague then raging in London. It has since been uninterruptedly published twice a week as an official court circular. The first London daily paper was published in 1709 under the name of the *Daily Courant*. At this time appeared Defoe's journal, the 'Review.' The first number of the 'Tatler' was published on 23 April 1709, and of the 'Spectator' on 1 March 1711. Though not properly newspapers in the modern sense of the term, their early numbers contained general news in addition to their other literary matter. In 1712 a tax or stamp-duty was imposed by the government of a half-penny on papers of half a sheet or less, and a penny on papers of a single and above half a sheet. The *London Daily Advertiser* first appeared in 1726, and became afterward celebrated by the publication of the famous 'Letters of Junius.' The *Morning Chronicle* appeared in 1769, and the *Morning Post* in 1772. The *Times* was first commenced 18 Jan. 1785, under the name of the *London Daily Universal Register*, which was afterward superseded by that of the *Times* on 1 Jan. 1788. It was ably conducted from the first by Mr. Walter, who in 1803 transferred the management to his son. The *Daily News* appeared in 1846, the *Daily Telegraph* in 1855, and the *Daily Standard* in 1857. Others of later establishment are the *Echo*, *Graphic*, *Mail*, *Pall Mall Gazette*, *Westminster Gazette*, etc.

The provincial English press began with the *Norwich Postman*, published in 1706, and followed by the *Norwich Courant* in 1714, and the 'Weekly Mercury, or Protestant's Packet' (at Norwich) in 1720. The 'Worcester Postman' appeared in 1708, the *Newcastle Courant* in 1711, the *Kentish Post* in 1717, and the *Leeds Mercury* in 1718.

Ireland and Scotland.—The first newspaper published in Ireland was the *Dublin News-Letter*, in 1685, followed by the *Dublin Intelligencer* in 1690. The *Belfast News-Letter*, still flourishing, first appeared in 1737. The 'Freeman's Journal' commenced in 1763. In Scotland on 31 Dec. 1660, appeared at Edinburgh the first number of the 'Mercurius Caledonius,' which had an existence of only three months. The *Edinburgh Evening Courant* was started in 1718. The *Caledonian Mercury* commenced in 1720 and existed 150 years. The *Edinburgh Gazette* dates from 1699. The first paper published in Glasgow was the *Glasgow Courant*, on 11 Nov. 1715, followed by the *Glasgow Journal* in 1729. The *Edinburgh Scotsman* was first issued in 1817, and the *Glasgow Herald* in 1782.

France.—The first French newspaper, *The Gazette de France*, appeared in 1631, edited by Theophraste Renandot, a physician, who had been in the habit for some time previously of presenting to his patients a printed account of the various occurrences of the day. The *Gazette* had a most successful career and existed until 24 Aug. 1848, when it was suspended. Two weeks later it was resumed under the title of *Le Peuple Français*, which title was again altered to *L'Etoile de la France*. The *Gazette Burlesque*, a newspaper in verse, was commenced in 1650, under the management of the poet Jean Lorel. The *Mercur Galant* was started by Donneau de Visé in 1672, and under the title of the *Mercur de France*, to which it was changed in 1717, continued to exist until 1853. After the Revolution a host of new papers appeared. Among these were the *Chronique de Paris*, the *Orateur du Peuple*, Hebert's *Père Duchesne*, and *Ami du Peuple*. Of all the newspapers, however, commenced at this eventful period, the only ones which have survived are the *Journal des Débats* and the *Moniteur*. Under Napoleon the press was subjected to a rigid censorship, which was continued until 1819. During the reign of Louis Philippe appeared *La Presse* and *Le Siècle*, both of which commenced in 1836. Since that date the growth of the newspaper press in Paris has been rapid. In 1903 over 1,400 newspapers were regularly published in Paris alone, some 60 of these being daily political organs. The most important of all is the *Temps*, with politics of moderate republicanism. *Le Petit Journal*, a cheap popular journal, has a circulation of over 1,000,000 daily.

Germany.—Egenolf Emmel, sometimes called the father of journalism, established at Frankfurt in 1615 *Die Frankfurter Oberpostamtzeitung*. A second journal was commenced at Hildesheim in 1619, and a third at Herford in 1630. At the end of the 17th century there were at least 30 daily newspapers in Germany. The *Hamburgischer Correspondent* appeared in 1714 as a continuation of the *Holsteinische Zeitungs-correspondence*, established in 1712. It was the first German newspaper which received news

of foreign affairs from correspondents resident abroad. The *Allgemeine Zeitung* was published in 1798, and soon rose to the highest position in German journalism. Other important journals are the *Norddeutsche Allgemeine Zeitung*, the *National Zeitung*, the *Neue Preussische Zeitung*, the *Volks-Zeitung*, the *Vossische Zeitung*, the *Kölnische Zeitung*, etc.

Russia.—The first journal in Russia appeared in 1703, and was followed by several others during the first half of the 18th century. The press in Russia is under very strict supervision, and thus naturally has but little influence in public affairs. The *Journal de St. Petersburg*, in French, has a considerable circulation outside of Russia.

Holland and Belgium.—The pioneer newspaper of Holland was first published in 1656. The early Dutch newspapers were distinguished by the accuracy of the information furnished by them. It was not until 1830 that they began to comment on public occurrences, their criticism having been previously directed to items of commercial intelligence. The principal Dutch journals are the *Allgemeene Handelsblad* of Amsterdam, the *Haarlemsche Courant*, the *Journal de la Haye*, and *Staats-Courant*, the two latter published at The Hague. Among Belgian papers the *Indépendance Belge*, the *Journal de Bruxelles*, and the *Etoile Belge* are distinguished for the ability with which they are conducted.

Australia.—There are nearly 1,000 papers published in Australia. The daily issues are excellent imitations of the London newspapers. The *Sydney Gazette* was established in 1803.

India.—The first Indian newspaper in the English language appeared in Bengal in 1780. There are upward of 300 newspapers published in the various vernacular tongues.

In Turkey the first newspaper appeared in 1795 in French, and the first daily journal in Spain was published in 1704. The modern newspapers of Norway, Sweden, Denmark, Italy, South Africa, Switzerland, Portugal, Greece, China, Japan, and South and Central America, are of less importance than those of the other countries heretofore mentioned, being largely local in character.

WILL M. CLEMENS,

Editorial Staff, 'Encyclopedia Americana.'

Newstead (nū'stéd) Abbey, England, on the border of Sherwood Forest, 10 miles north-west of Nottingham, was an Augustinian Canons institution founded in 1170 by Henry II. in atonement for Becket's murder. In 1540, after the dissolution, it was given to Sir John Byron the Little, and is celebrated in connection with Lord Byron, the poet, who made the semi-ruinous edifice his home in 1808, but sold it in 1818. The abbey has since been restored, and has many carefully preserved relics of the poet. Consult: Irving, 'Abbotford and Newstead.'

Newt, a small tailed batrachian of the genus *Diemystylus*, *Triton*, or a related genus, but sometimes considered to constitute a distinct family, under the name *Pleurodelidae*. Newts are sometimes also called elms or tritons, and the name is often applied erroneously to salamanders of other genera not closely related. Among technical characteristics of the newts in general are the bony carpus and tarsus, the bony ball-and-socket joints of the vertebrae, and the nar-

row bands of palatine teeth. The species are more strictly aquatic than most salamanders, and the males of most species undergo remarkable seasonal changes in the development of high dorsal crests, papillae, or other appendages on the arms and elsewhere, and of brilliant colors. About 20 species belonging to this group of genera are known, of which more than half are European, several Asiatic, and only two North American, while none have been found elsewhere. The eastern American species (*Desmystylus viridescens*), of which a quite distinct variety occurs in Texas and Mexico, is abundant throughout the Eastern States, and extends into Canada. It may be distinguished by the rather narrow arched head marked with a pair of longitudinal keels, and the handsome greenish red color of the back, the pale yellow below, and the row of conspicuous scarlet, black-bordered spots on each side. In the adult stage just described this animal is about $3\frac{1}{2}$ inches long and completely aquatic. A terrestrial form is somewhat smaller, lacks the dorsal crest altogether, has a rougher skin and a bright vermilion color. This is the pretty little creature common in eastern woods, which later returns to the water and assumes the greenish garb. Newts are chiefly nocturnal, and when abroad swim actively, not merely crawling on the bottom in the manner of most salamanders. They feed on all kinds of aquatic larvae, worms, small mollusks, and crustaceans, and are very voracious. During the breeding season in the spring the male develops a broad cutaneous fin, richly provided with sense organs on the back and tail, and becomes otherwise modified. The fertilized eggs are deposited singly, each in a gelatinous capsule whose adhesive nature permits of their attachment to water-plants, some of the leaves of which are drawn about each egg. The larvae are strictly aquatic and possess three pairs of external gills, but after metamorphosing, leave the water and assume the red terrestrial phase, when they live in the woods under stones and logs, appearing at night or during rain. This stage lasts for several years, when they seek the water either in the spring or fall and soon acquire the adult color and characteristics. Whether or not they can again enter the red phase by leaving the water is not certainly determined. Like frogs, newts swallow the skin after molting, which appears to take place most readily while the animal is immersed in water.

The Pacific newt (*Desmystylus torosus*) is nearly twice as large, and is further distinguished by the wide, flat, keelless head, and brown, unspotted color. It is very abundant in California, and ranges from the southern part of that State to Alaska. Its habits are essentially similar to those of the eastern species. It feeds on earthworms, snails, slugs, insects, and its own sloughed skin, eggs and young. In this species the eggs are deposited in clumps.

The numerous European species present many interesting differences in detail in habits, especially in the mode of reproduction. Some of them live habitually away from the water and migrate long distances to it in the spring, and one species is remarkable from the fact that the ribs penetrate the skin. All of the newts make very interesting and satisfactory aquarium pets.

J. PERRY MOORE,
University of Pennsylvania.

Newton, nū'tŏn, Alfred, English ornithologist and zoologist: b. Geneva 11 June 1829; d. London 7 June 1907. He was educated at Magdalene College, Cambridge, of which he was traveling fellow 1854-63, fellow in 1877, and till his death professor of zoology and comparative anatomy. He took a prominent part in urging bird protection by legislation; traveled in Lapland, Iceland, West Indies, North America, and Spitzbergen; edited 'The Ibis' (1865-70) and the 'Zoological Record' (1870-2), contributed the ornithological articles in the 9th edition of the 'Encyclopædia Britannica'; and greatly advanced the study of the comparative anatomy of birds. He wrote 'The Zoology of Ancient Europe' (1862); 'Ootheca Woolleyana' (1864-1902); 'Zoology' (1894); and a 'Dictionary of Birds' (1893-6).

Newton, Sir Charles Thomas, English archaeologist: b. Bredwardine, Wales, 13 Sept. 1816, d. Westgate-on-Sea 28 Nov. 1894. He was educated at Shrewsbury School, and at Christ Church College, Oxford, and was assistant in the department of antiquities in the British Museum 1840-52. He became vice consul at Mytilene in 1852, and acting consul at Rhodes in 1854; discovered the tomb of Mausolus at Halicarnassus and the famous bronze serpent of Delphi at Constantinople; and after a year as consul at Rome in 1861 became keeper of Greek and Roman antiquities in the British Museum, being the first incumbent of this post and holding it until December 1885. During this term he furthered archaeological excavations in Ephesus, Priene, Smyrna, Sicily, Cyprus, Cyrene, and Rhodes, and procured for the British Museum the Farnese collection, the two Castellani collections, and those of Pourtales and Blacas. From 1880 to 1888, Newton (who was knighted in 1887) was professor of classical archaeology in University College, London; to his work there and in the British Museum is largely due the revival of English interest in classical antiquities. He wrote: 'Method of the Study of Ancient Art' (1890); 'History of Discoveries at Halicarnassus, Cnidus, and Branchidae' (1862-3); 'Travels and Discoveries in the Levant' (1865); and 'Essays on Art and Archaeology' (1880).

Newton, Gilbert Stuart, English painter: b. Halifax, Nova Scotia, 2 Sept. 1795; d. Chelsea, England, 5 Aug. 1835. His mother was sister to Gilbert Stuart, the American portrait-painter, his father an officer in the British army, and he went eventually to England after visiting Italy and France (1817). After studying at the Royal Academy he exhibited regularly both in the Royal Academy and the British Institution from 1818 to 1833. He was elected Royal Academician in 1832. The last three years of his life he was confined in a private asylum for the insane. His pictures are mostly domestic scenes, are anecdotic in motif, and he especially excelled in the portrayal of feminine beauty of the English type. His best works include: 'The Gentle Shepherd'; 'The Dutch Girl' (both of which were engraved); 'Porcelain and the Doctors'; 'The English Girl'; 'Olivia's Return'; 'The Forsaken.'

Newton, Henry Jotham, American manufacturer and chemist, inventor of the dry-plate photographic process: b. Hartleton, Pa., 23 Feb. 1823; d. New York 23 Dec. 1895. At 20 he was

NEWTON

a partner in the firm of Wittlesey Brothers, piano-makers, Salem, Conn., whom he left six years later to form the New York firm Lighte and Newton; this new company greatly improved the manufacture of pianos. Newton was later connected with the Bradburys in the piano trade; in 1884 he became president of the Henry Bonnard Bronze Co. His invention of a permanent collodion emulsion and of the other details of the dry-plate process in photography dates from 1875. Educated a Presbyterian, Newton joined the Methodist Church, then the Unitarian, and finally allied himself with the Spiritualists. A society formed by him in 1875 for psychical research was, he claimed, the first Theosophical Society, from which Mme. Blavatsky and Henry S. Olcott took the ideas which they falsely proclaimed to be of Indian origin.

Newton, Hubert Anson, American astronomer and mathematician: b. Sherburne, N. Y., 19 March 1830; d. New Haven, Conn., 30 Aug. 1896. He was graduated at Yale in 1850, and in 1855 became professor of mathematics there. He spent one year in foreign study and for the rest of his life lived quietly in New Haven. He was far better known as an astronomer than as a mathematician, because of his remarkable researches as to meteors, and meteoroids, undertaken to verify Olmsted's hypothesis that meteors were the more visible portions of a great stream of bodies with a fixed orbit about the sun, and this hypothesis he proved correct by a brilliant and painstaking series of mathematical computations. He wrote on meteors for several encyclopædias, and published most of his original papers on that subject in the 'Memoirs' of the National Academy and in the 'American Journal of Science,' of which he was long editor. The National Academy awarded him the Smith gold medal for his work on meteors. Newton did much to introduce the study of the metric system into the public school curriculum; was an authority on the theory of transcendental curves; and wrote various tables for life insurance companies. He was a simple, genial, modest man, and deeply interested in the material advancement of Yale College.

Newton, Sir Isaac, English mathematician and natural philosopher: b. Woolsthorpe, Lincolnshire, 25 Dec. 1642; d. Kensington 20 March 1727. He was sent at an early age to the village school, and in 1654 to the free grammar school of Grantham. He was entered at Trinity College, Cambridge, in 1661. He had the good fortune to find in the celebrated Dr Barrow, professor of Greek (1660-3) and from 1663 Lucasian professor of mathematics, an assistant in his mathematical studies. He appears to have found particular interest in Wallis' treatise, 'Arithmetica Infinitorum.' He was graduated in 1665. While absent from Cambridge in 1665-6, during the plague, he discovered the binomial theorem (q.v.) and the direct and inverse methods of fluxions (q.v.) (that is, differential and integral calculus); computed the area of the hyperbola; and first turned his attention to the subject of gravity. The familiar story, first given by Voltaire, is that the fall of an apple led him to reflect on the nature of that remarkable principle which attracts bodies to the centre of the earth. He considered that if the moon was retained about the earth by terres-

trial gravity, the planets, which move round the sun, ought similarly to be retained in their orbits by their gravity toward that body. Having determined the law of the gravity of the planets toward the sun he endeavored to apply it to the moon, that is, to determine the velocity of her motion round the earth by means of her distance, as settled by astronomers, and of the intensity of gravity, as shown by the fall of bodies at the earth's surface. To make this calculation it was necessary to know exactly the distance from the surface to the centre of the earth; but unfortunately at that time there existed no correct measure of the earth's dimensions. Newton was obliged to employ the imperfect measures then in use, and found that they gave for the force which retains the moon in her orbit a value greater by one sixth than was allowed by observed facts. This small difference seemed to his cautious mind a strong proof against his bold conjecture. He imagined that some unknown cause modified, in the case of the moon, the general law of gravity indicated by the motion of the planets. Yet he did not abandon his leading notion, but determined to wait till study and reflection should reveal to him this supposed unknown cause. In 1667 he returned to Cambridge as fellow of Trinity, and in 1668 constructed a reflecting telescope. In the latter year Mercator published his 'Logarithmotechnia,' in which he had obtained the area of the hyperbola referred to its asymptotes by expanding its ordinate into an infinite series, which was the main secret of Newton's method. Barrow showed this work to Newton, who immediately gave him his own treatise, but did not yet publish.

In the course of 1666 his attention had been accidentally drawn to the phenomena of the refraction of light through prisms. His experiments led him to conclude that light, as it emanates from the radiating bodies, is not a simple and homogeneous substance, but that it is composed of a number of rays, endowed with unequal refrangibility and velocity and possessing different coloring properties. More than two years elapsed before he returned to his researches on this subject; but in 1669, having been appointed Lucasian professor of mathematics, and preparing to lecture on optics, he endeavored to mature his first results, and composed a complete treatise, in which the fundamental properties of light were unfolded, established, and arranged by means of experiments alone, without any mixture of hypothesis—a novelty at that time almost as surprising as these properties themselves.

In 1672 Newton was chosen a fellow of the Royal Society, to which he communicated a description of a new arrangement for reflecting telescopes, which rendered them more convenient by diminishing their length without weakening their magnifying powers, and soon after, the first part of his labors on the analysis of light, in which he advocated the material theory (that is, that light consists of small particles shot out by a luminous object), the society appointed three members to study it fully and report upon it. Hooke undertook to draw up the report. Instead of discussing the new facts as presented by the experiments of Newton, he examined them merely in relation to his own hypothesis—now known as the undulatory theory, and ac-

cepted as the true one — and concluded by allowing whatever appeared reconcilable with his own hypothesis, and by advising Newton not to seek any other explanation of the facts. Newton in reply adduced new experiments confirming his material (or corpuscular) theory and refuted the objections to the production of whiteness by the mixture of all the rays. He addressed another paper (1675) to the Royal Society, completing the account of his results and of his views on the nature of light. This treatise, united with his first paper on the analysis of light, afterward served as the base of the great work, 'Treatise on Optics' (1704), in which, however, the experimental investigation of the phenomena is more extensive and more strictly separated from all hypothesis. It is now known that Newton was wrong, and that light results from wave-motion in a pervading medium called ether. But Hooke's explanations were vague, and his theory remained untenable until the discovery, a century later, of the principle of interference (q.v.). In 1679 Newton had occasion to write to Hooke about a system of physical astronomy on which the Royal Society had asked his opinion. Hooke and Newton held conflicting opinions, and Newton, having examined by mathematical calculations a position maintained by Hooke, found that an attractive force, emanating from a centre, and acting inversely as the squares of the distances, would produce motions exactly resembling the planetary motions both in regard to the form of the orbit and the velocity of the body at each point. This was the secret of the system of the world; but it still remained to account for the discordance of the moon's motion, which had before (1665) embarrassed Newton. But in 1682 he learned the results of a new measurement of the arc of a meridian. Two years were spent in following up the consequences of this discovery, and preparing his immortal work 'Philosophiæ Naturalis Principia Mathematica'; but it was not till 1686 that he concluded to present his work to the society, and it was printed in 1687 at the personal expense of Halley, the secretary. Newton's teachings were introduced at Cambridge in 1699 and at Oxford in 1704, but were not admitted by the French scientists for half a century.

In 1687 Newton was one of the delegates sent by the University of Cambridge to maintain its rights before the High Commission court when they were attacked by James II., and in 1689 he was elected by the university to the convention parliament, but never distinguished himself in that body. He had always taken great interest in chemistry, and constructed a small laboratory for prosecuting his investigations, and seems, after the publication of the 'Principia,' to have devoted almost his whole time to them.

In 1696 he was appointed warden of the mint, a general recoinage having then been undertaken. In this office he rendered essential service, and in 1699 was made master of the mint. In 1701-2 he again sat in Parliament for his university; in 1703 he was chosen president of the Royal Society; and in 1705 was knighted by Queen Anne. In 1704 he gave to the world his 'Optics' which contains all his researches on light. Later works were his 'Arithmetica Universalis' (1707; more complete 1712); 'Methodus Differentialis' (1711); and his 'Anal-

ysis per Equationes Numero Terminarum Infinitas' (1711); 'Chronology of Ancient Kingdoms Amended' (1728); and 'Observations on Daniel and the Apocalypse' (1733), an attempt to show the fulfilment of the prophecies. In 1705-12 he was involved in a controversy with Flamsteed; and in 1705-24 in one with Leibnitz as to priority in the discovery of fluxions. The splendid genius of Newton has often been testified to, among many by Macaulay, who declared that in no other person did the demonstrative and inductive faculties ever exist in such perfect co-ordination. His statue, by Roubiliac, stands in Trinity College, Cambridge. Horsley's edition of his works (1779-85), with the 'Opuscula,' collected by Castillon (1744), and his 'Letters,' inserted in the 'Biographia Britannica,' contain nearly all his printed works. Three editions of the 'Principia' were published in his own lifetime; the last reprinted at Glasgow in 1871 by Sir W. Thomson (Lord Kelvin) and Professor Blackburn. The standard 'Life of Newton' is that by Sir David Brewster, who had full access given him to the great mass of Newton's papers (1855; 2d ed. 1860).

Newton, John, English astronomer and mathematician: b. Oundle, Northamptonshire, England, 1622; d. Roas, Herefordshire, England, 25 Dec. 1698. He was graduated from Oxford University in 1642 and engaged in mathematical and astronomical work, remaining loyal to the king during the Protectorate. After the Restoration he was made king's chaplain in 1661 and became canon of Hereford in 1673. He wrote: 'Institutio Mathematica' (1654); 'Geometrical Trigonometry' (1659); 'Introduction to the Art of Logic' (1671); 'Cosmography' (1679); etc.

Newton, John, English clergyman: b. London 24 July 1725; d. there 21 Dec. 1807. He led a wandering life on the sea in 1756-55, but in 1748 underwent strong religious experiences, the effects of which were increased by the preaching of Wesley and Whitefield, and after a period of private study was ordained priest in the Church of England in 1764. From 1764 to 1780 he was curate of Olney, Buckinghamshire, and then became incumbent of Saint Mary Woolnoth, London, where he preached until the year of his death. His evangelical influence was very strong there, and he preached to large congregations. He is best known, however, for his connection with the poet Cowper, who settled at Olney in 1767, and who was kept occupied by the good man in an almost uninterrupted round of religious exercises. Newton seems to have foreseen the outcome, and endeavored to provide congenial occupation for the poet in seeking from him contributions to the 'Olney Hymns.' Newton received his D.D. from the College of New Jersey (Princeton) in 1792. Among his publications are 'Review of Ecclesiastical History' (1770) and 'Cardiphonia' (1781). See Cowper.

Newton, John, American military engineer: b. Norfolk, Va., 24 Aug. 1823; d. New York 2 May 1895. He was graduated from West Point in 1842 and was appointed to the engineering corps. At the beginning of the Civil War he was chief engineer of the department of Pennsylvania and in September 1861 was made brigadier-general of volunteers. He served with

SIR ISAAC NEWTON.

NEWTON

distinction through the war and in 1865 was promoted brigadier-general and major-general in the regular army. He was mustered out of the volunteer service in 1866 but continued in the regular army, and in 1884 was made chief of engineers. He engineered the removal of the obstructions at Hell Gate Channel in the East River, New York; was commissioner of public works in New York, and in 1886 was retired at his own request.

Newton, Richard Heber, American Protestant Episcopal clergyman: b. Philadelphia 31 Oct. 1840. He was son of the rector of Saint Paul's, Philadelphia, studied in the Philadelphia Divinity School, was assistant to his father (1860-2) and, after a short time in a church at Sharon Springs, N. Y., succeeded his father in Philadelphia, leaving this charge in 1869 to go to All Souls' Church, New York. In 1903 he was appointed preacher to Leland Stanford, Jr., University but soon resigned this position. He is a broad-churchman, and has several times been threatened with trial for heresy. He took a prominent part in the Congress of Religions held at Chicago in 1893 and is now vice-president of the organization of this congress. He wrote: 'The Morals of Trade' (1876); 'Womanhood' (1880); 'Philistinism' (1885); 'Social Studies' (1886); 'Church and Creed' (1891); and 'Christian Science' (1898).

Newton, William Wilberforce, American Episcopal clergyman: b. Philadelphia, Pa., 4 Nov. 1843. He was graduated from the University of Pennsylvania in 1865 and has held important rectories in Newark, N. J., Boston, Mass., and Pittsfield, Mass. He has published: 'The Pilgrim Series of Sermons to Children'; 'A Run Through Russia'; 'The Child and the Bishop'; 'Summer Sermons from a Berkshire Pulpit'; etc.

Newton, Ill., city, county-seat of Jasper County; on the Embarras River, and on the Peoria, D. & E., and the Illinois S. R.R.'s; about 100 miles in direct line southeast of Springfield. It is in a productive agricultural region, and in the vicinity of large coal fields. The chief manufactures are dairy products, flour, brick, tile, lumber products, and woolen goods. The city has considerable trade in farm and dairy products, fruit, coal, and its manufactures. Pop. (1910) 2,108.

Newton, Iowa, city, county-seat of Jasper County; on the Chicago, Rock Island & P. and the Iowa Central R. R.'s; about 30 miles in direct line east by north of Des Moines, the capital of the State. It is the commercial centre of a rich agricultural section in which considerable attention is given to stock-raising. The chief manufactures are flour, foundry and machine-shop products, agricultural implements, tile, and brick. The trade is chiefly in farm products, live-stock, and manufactures. The city owns and operates the waterworks. Pop. (1910) 4,616.

Newton, Kan., city, county-seat of Harvey County; on the Atchison, T. & S. F., and the Missouri P. R.R.'s; about 201 miles southwest of Kansas City and 115 miles southwest of Topeka. It is in the south central part of the State, in the valley of the Arkansas River, one of the most fertile sections of Kansas. It was settled in 1871 and incorporated a city in 1880. The

chief manufacturing establishments are flour mills, drill factory, separator factory, creamery, large ice plant, and stock yards. It is a division point of the Santa Fé Railroad and has repair shops. The number of railroad employees who are residents of Newton is about 500; and about 200 men are employed in the manufacturing establishments mentioned. There are 13 churches for white people and two for the colored. It is the seat of Bethel College, the only college in America under the auspices of the Mennonite Church (1904). It has a high school, good public and parish schools, and a Carnegie library. The three banks have a combined capital of \$160,000. The government is vested in a mayor, who holds office two years, and a council of eight members, also elected biennially. The majority of the people are native born; the foreign born are Germans, Irish and French. Pop. (1910) 7,862.

J. C. MACK,
Manager, 'Kansas Republican.'

Newton, Mass., city in Middlesex County; on the Charles River, and on the Boston & A. railroad; six miles west of Boston. The area is 18 square miles; the city includes 13 villages. It was settled in 1631 and was part of Cambridge until 1688, when it was incorporated as a town under the name of New Cambridge, which name it retained until 1692; the city charter was granted in 1873. Newton is a beautiful residential city; within its limits is a part of the Metropolitan Park; its own city parks cover an area of about 170 acres. A large cemetery, in a prominent part of the city, contains the graves of many people noted in history. Newton has some manufacturing establishments, chief of which are boot and shoe factories, silk mills, fire-alarm supply works, rubber works, paper-box and curtain factories, printing works, worsted mills, and cordage factory. It has the Lasell Seminary for women (1851); the Allen School for boys (1853); Saint John's Industrial School, the Newton Theological Seminary, opened in 1805 under the auspices of the Baptists, and a public library which contains about 60,000 volumes. The prominent public buildings are several beautiful churches, the high school, the elementary and parish schools. Near the site of Waban's Wigwam, where John Eliot began to preach to the Indians, 28 Oct. 1606, stands the Eliot Memorial.

The annual municipal expenditures for maintenance and operation are about \$1,000,000. The chief items of expense are: for public schools, \$200,000; for streets, parks, sewers, \$172,000; interest on debt, \$264,000; police department, \$69,500; fire department, \$59,000; municipal lighting, \$54,000; health department, \$22,000; charity, \$26,000. The government is administered under a revised charter of 1902, which provides for a mayor who holds office two years; and a board of aldermen consisting of 21 members, three from each ward. The mayor and aldermen appoint or elect the administrative officials, except the school board, which is chosen at a popular election and for a term of three years. The city owns and operates the waterworks. Pop. (1900) 33,587; (1910) 39,806. Consult Smith, 'History of Newton.'

Newton, N. J., town, county-seat of Sussex County; on the Delaware, Lackawanna & W. railroad; about 40 miles northwest of Newark. It is in an agricultural region, and in the vicin-

NEWTON THEOLOGICAL INSTITUTION—NIAGARA FALLS

ity are slate quarries. The chief manufactures are roofing slate, silk, paper boxes, shoes, and dairy products. It is the seat of the Newton Collegiate Institute and it has the Dennis Library, which contains about 9,000 volumes. Newton is known as a summer resort. The town owns and operates the waterworks. Pop. 4,700.

Newton Theological Institution. See NEWTON, MASS.

Newtonian Philosophy. See NEWTON, SIR ISAAC.

Newtown, N. Y., since 1898 a part of the borough of Queens in New York city; formerly a separate town in Queens County. It was settled in 1652 by people from New England, and was first called Middleburgh. In 1664 it became a part of Connecticut and was then called Hastings. The following year it came into possession of New York and the name was changed to Newtown. Consult Riker, Jr., 'The Annals of Newtown.'

Next Friend, in law, an adult, other than a guardian, who represents in an action, another person not legally competent to maintain a suit in his own behalf. The practice originated in England in the time of Edward I. A next friend is not a party to an action but acts solely for another, and is considered an officer of the court.

Ney, nâ, Michel, Duke of Elchingen, Prince of the Moskva, French soldier: b. Sarrelouis (Moselle) 10 Jan. 1769; d. Paris 7 Dec. 1815. In 1787 he entered the military service. He soon attained great distinction for bravery, was quarreled over by Kleber and Jourdan as to who should have his services, contributed greatly to the victory of Hohenlinden, and obtained the marshal's baton in 1804. He opened the campaign of 1805 against Austria by a brilliant victory at Elchingen 14 October (whence his title Duke of Elchingen), and brought about the capitulation of Ulm. He occupied the Tyrol, and marched on to Carinthia, when stopped in his career by the Peace of Presburg. In 1806 and 1807 he fought at Jena, and after the capture of Magdeburg at Eylau and Friedland. In 1808 he maintained his high reputation in Spain. Napoleon recalled him, but kept him at a distance till the commencement of hostilities against Russia, when he received the chief command of the 3d division of the imperial forces. He commanded the centre at the battle of the Moskva, and so distinguished himself as to earn the title of Prince of the Moskva. In the conduct of the retreat, in which he commanded the rear-guard, his ability, valor, and devotion were conspicuously manifest, and he exerted himself to the utmost to save the wreck of the army Napoleon and Murat had deserted. In 1813 he decided the victory of Lützen, assisted at Bautzen and Dresden, but was defeated by Bernadotte at Dennewitz. He was now obliged to retire to Torgau, but soon took the field again; chased the Swedes from Dessau; and fought at Leipsic and Hanau. When the enemy entered France he disputed every step of their progress. Brienne, Montmirail, Craonne, and Châlons-sur-Marne are shining names in the history of his battles.

After Napoleon's abdication, Ney took the oath of allegiance to the king, was made a peer,

and received the cross of Saint Louis and the command of the cuirassiers, dragoons, chameaux, and light-armed lancers. He enjoyed marked distinction at court, and appeared to be entirely devoted to the Bourbons. When Napoleon landed on his return from Elba Ney collected a large force, was appointed its commander, and with many assurances of his zeal and fidelity to the king marched against the invader. But noticing the desertion of his soldiers and their inclination for Napoleon he regarded the cause of the Bourbons as lost. He joined Napoleon at Lyons on 13 March, and thus opened his way to Paris. Napoleon gave him the command of his left wing, which engaged with the British at Quatre Bras. At Waterloo he led the last charge of the Old Guard, and had five horses shot under him. His clothes were full of bullet-holes, and he fought on foot till night in the midst of the slain. He was tried for treason, sentenced (5 December) to death, and shot in the Luxembourg garden. "After the execution," says Lamartine, "bitter shame seized on every soul." It was universally regretted that Ney, the brave, had been chosen to suffer. Consult: 'Mémoires du Maréchal Ney' (1833); Rouval, 'Vie du Maréchal Ney' (1833); Nollet-Fabert, 'Eloge Historique' (1852).

Nes Percé (nâ pâr-sâ') Indiana. See CHOPUNNICK; SAGARTIAN.

Ngami, ngâ'mê, Lake, Africa, in Western Rhodesia, north of the Kalahari Desert, a portion of a great prehistoric inland sea, when first visited by Livingstone and Oswell in 1849, about 20 miles long, 10 miles broad, and very shallow. Its only feeder was the Tege or Kubango and its outlet the Botletli or Zuga. In the rainy season the water was fresh, but in the dry season the lake became a mere brackish marsh. Since 1890 the waters have gradually disappeared, the site of the lake now being marked by an extensive reedy marsh-land, some portions of which are utilized for growing corn.

Ngan-Hui, n-gân-hwê', or Ngan-Hwai, n-gân-hwâ'ê, China, an eastern inland province, intersected by the Yang-tse-kiang, separated from the ocean eastward by the provinces of Che-kiang and Kiang-su, and bounded northwest by Ho-nan, west by Hu-peh, and south by Kiang-si. Area 54,810 square miles; pop. about 24,000,000. Capital Ngan-king-fu (q.v.).

Ngan-King-Fu, n-gân' king' foo', China, a city and river-port, capital of Ngan-hui (q.v.), on the north bank of the Yang-tse-kiang, about 200 miles above Nanking, since 1897 open to foreign trade. It suffered severely during the Tai-ping Rebellion. Pop. about 50,000.

Ngornu, n-gôr'noo, or Angornu, Africa, a town of Bornu, British Northern Nigeria, on the southwest shore of Lake Chad, 15 miles south of Kuka, the capital. It is on the trade route communicating with the interior and the coasts, and its fairs are of great commercial importance. The town is subjected to inundations from the lake during the wet season. Pop. (est.) 40,000.

Niagara, ni-âg'â-râ, Battle of. See LUNDY'S LAKE, BATTLE OF.

Niagara Falls, Canada, a town of Welland County, Ontario, on the west bank of the Niagara Gorge, just below the Falls, and opposite Niagara Falls, N. Y. It communicates with

NIAGARA FALLS

the United States by three bridges, has electric and steam railroad service, and is a station on the Michigan Central, Grand Trunk, and Saint Catharine's & Niagara Central R.R.'s. It commands the best view of the Falls from Queen Victoria Niagara Falls Park, extending above and below the Falls for two and a half miles. An enormous electric power plant, larger than that on the United States side, has been constructed to utilize the water power. The town was originally named CLIFTON or SUSPENSION BRIDGE after its English prototype at the Severn Gorge, Bristol (q.v.).

Niagara Falls, N. Y., city in Niagara County; on the Niagara River, and on the New York C. & H. R., the Wabash, the Erie, the Michigan C., the Grand T., the West S., and the Lehigh R.R.'s; about 25 miles north by west of Buffalo. Until 1892 what is now the city constituted two separate villages, Niagara Falls and Suspension Bridge; they were consolidated in that year and chartered as a city. (For the New York State Reservation and the bridges connecting the city with the town of Niagara Falls (q.v.), Ont., see NIAGARA FRONTIER.) The manufacturing establishments have increased and are increasing since the utilization of the power of the river by the new methods. The chief manufactures are paper, flour, dressed lumber, wheat biscuit, electro-chemical products, foundry products, machinery, chemicals, and wood products. It has a public library, the building for which was donated by Andrew Carnegie, a high school, business schools, public and parish schools, the De Veaux College (P. E.), and the Niagara University (q.v.).

On account of the Falls, one of the scenic wonders of the world, the city is visited annually by thousands of tourists. The government, administered under the original city charter, provides for a mayor, who holds office one year, and a council. The administrative officers are appointed or elected by the mayor and council. The assessed value of real estate (1910) was \$23,821,800. Pop. (1910) 30,445.

Niagara Falls. The Niagara River is about 32 miles long from its beginning at Buffalo to its termination at Fort Niagara; it connects Lake Erie, 573 feet, with Lake Ontario, 247 feet above the ocean, and carries the drainage of Lakes Superior, Huron, Michigan, Saint Clair, and Erie, estimated at a flow equal to 20,000,000 cubic feet of water per minute by the way of the Saint Lawrence into the ocean. About 20 miles from Buffalo and 12 miles from Fort Niagara are situated the Falls of Niagara, in 42° 55' N. and 79° 5' W.; the "Thunder of Waters" of the aborigines; the "most awe-inspiring spectacle" ever seen by Father Hennepin in all his travels, when he first viewed them in 1678; the point toward which 3,000,000 of people travel annually from all parts of the American continent and from Europe. Here the waters which have descended 50 feet in a series of rapids within half a mile make a sudden plunge of 165 feet in two divisions. The American Fall, with a more or less straight crest of 1,000 feet in length, extends along the eastern bank of the river in a north-northeast and south-southwesterly direction; while the other division, the Horseshoe or Ca-

nadian Fall, with a deep curve in the centre, runs at right angles to the course of the river. The crest of the latter measures 3,010 feet and carries by far the largest volume of water. The line of deepest water is accepted at about the middle of the Horseshoe Fall, and as that more or less imaginary line forms the boundary between the United States and the Dominion of Canada, the islands at and near the Falls of Niagara are all United States territory. From the foot of the Falls the river descends among cliffs of 200 to 350 feet high in a series of rapids for a distance of three miles until it reaches the Whirlpool, a circular excavation in the westerly bank of the river, the boundaries of which are rocky cliffs 300 feet high for about two thirds of its circumference, while the other third, its northerly bank, is made of an accumulation of sand, gravel and clay. Into this hole the river rushes with tremendous force and speed, in a northwesterly, but has to turn at right angle and leave it in a northeasterly, direction. The impact of the rushing water, striking against the banks, meets in its recoil new waters looking for an outlet, and the meeting of these different currents produces the rotary movements of the waters from which the Whirlpool derives its name, and as an exhibition of wonderful water-power the Whirlpool and the Whirlpool Rapids are looked upon by many visitors as more interesting than the Falls themselves. A further series of rapids carry the water to Lewiston, at the foot of Lewiston escarpment. Here the gorge ends and the river flows in a low plain down to Lake Ontario. The width of the gorge varies from 700 feet at the Whirlpool Rapids to 1,700 feet opposite the centre of the American Fall. These measurements are for the tops of the gorge; at the water line these figures are usually reduced one half on account of the talus which has accumulated; thus, the gorge at the inlet to the Whirlpool measures 1,000 feet at the top and 550 feet at the water. The outlet of the Whirlpool has a width of 900 feet at the top and 450 feet at the water. After the river leaves the gorge at Lewiston it has a fairly uniform width of 2,000 feet.

The narrowest part of the river is at Foster's Flats, about one mile below the Whirlpool, on the Canadian side. Although the tops of the banks here are 1,500 feet apart, the river is scarcely 300 feet wide. A platform of limestone projects out into the river, and from its base a well-marked dry channel leads northward for about one third of a mile to the edge of the water. The floor of this channel is strewn with huge limestone blocks, and its westerly bank is continuous with the steep wall of the present gorge.

The depth of water on the crest of the American Fall is fairly well known, and measures from 4 to 10 feet; northerly and easterly winds at times set the water back in Lake Erie, and the fall has been known to be almost dry. The depth of the Horseshoe Fall is not known. The only attempt to obtain any approximate idea was made many years ago; an old vessel was loaded down with stones until it drew 20 feet of water, and started down the current; it went over the edge without touching, hence the conclusion was that the deepest water on the edge of the Horseshoe Fall is at least 20 feet

NIAGARA FALLS

The depth of water in the river has been usually overestimated by hundreds of feet until the United States Lake Survey has given us a series of soundings as follows:

	Feet
At the foot of the centre of the Horseshoe Fall	150-200
Through the upper gorge to the Whirlpool	160-190
Rapids	35
Whirlpool Rapids	150
Whirlpool	50
Whirlpool outlet	35-70
Gorge below Whirlpool	

Of course, with such tremendous currents, twisting and whirling in all directions, soundings cannot be much more than approximate, but they dispel the idea of the many hundreds, and even thousands, feet of depth entertained before.

If we make an imaginary ascent from Lake Ontario for a geographic study, we find a vast plain, seven miles long from north to south and as far as the eye can reach east and west, which brings us to the so-called first limestone terrace of New York, more popu-

dashes the Niagara River, and three miles to the west another about one mile in width, at the little town of Saint David's. Ascending this old valley in a southeasterly direction we arrive at the Whirlpool. Excepting this Saint David's Valley and the gorge of the Niagara, the land to the south of the escarpment is fairly level until we meet above the Falls two shallow valleys; on the west that of Chippewa Creek and on the east that of Tonawanda Creek, tributaries to the Niagara River. The southern bank of the valleys of these creeks is formed by the second limestone terrace of New York, which runs through Canada, forms partly the north shore of Lake Erie, crosses Niagara River, presents a very conspicuous unit in the landscape of northern Buffalo, and runs in a west-southwest and east-northeast direction through western New York.

The life history of Niagara Falls is of supreme importance to the geologist to-day, as its complete elucidation would give a measurement of the time elapsed since the disappearance of the northern ice sheet of the Glacial period. Since the time of Hall and Lyell, in 1842, up to the present of Walcott and Grabau, the problem has been attacked with vigor and care, and viewed and reviewed from every possible standpoint and according to the varying theories of the time. Spencer, Pohlman, Upham, Taylor, Wright, Hitchcock, Bishop, are the names of but a few of those who have studied the problem, and there is still variety enough of opinion to interest many more. As a matter of estimates of the age of the Falls, the consensus of geological opinion varies between 5,000 and 50,000 years, and demonstrates that this absorbing study is far from being exhausted.

The site of the present Niagara Falls and river was in general outlines determined in preglacial times, when the American continent stood at an elevation of from 2,000 to 5,000 feet higher than at present. A system of large rivers had excavated the present basin of Lake Erie, and the combined drainage of these valleys found its way into the present basin of Lake Ontario by the way of the Dundas Valley and the city of Hamilton, Ontario. These rivers could not have drained along the present Niagara River, because the inlet at Buffalo was closed by the limestone terrace, the top of which was from 100 to 150 feet higher than the river-bed which had been excavated to the south of it, the valley of which now forms the eastern end of Lake Erie. The rock bottom of Lake Erie is almost everywhere covered by a deposit of clay and gravel to the height of 100 to 300 feet and at its eastern end the real lake bottom is from 80 to 100 below its apparent bottom. The present Niagara River flows at Buffalo over rock at a depth of from 14 to 16 feet.

With the continent at several thousand feet higher above the ocean level than to-day, these large river valleys could excavate their beds deeper down than at present, and we can understand why the bottom of all the Great Lakes, with the exception of Lake Erie and Lake Saint Clair, is about 500 feet below the ocean level. During the same period the present Tonawanda and Chippewa creeks had excavated a shallow east and west valley in the

Preglacial Drainage.

(Dotted lines, present drainage; black lines, preglacial drainage.)

larly known on the American side as Lewiston Heights, on the Canadian side as Queenston Heights. Here we ascend suddenly 250 feet. In this escarpment we have two gaps, one about one quarter of a mile wide through which

NIAGARA FALLS

soft shale of the Onondaga Salt group, and combining their waters, they found their way north by the way of Goat Island, upper gorge, Whirlpool, and Saint David's Valley into the basin of Lake Ontario.

The action of small streams under similar conditions, excavating their gorges and finding their way north over the same strata as those at Niagara, can be studied to advantage in the 14-mile creek at St. Catharines, Ontario, or at Oak Orchard Creek or in the Genesee River of New York. Beginning at the mouth of these creeks and traveling up-stream, we find three falls, one over the sandstone layer of the Medina group, one over the Clinton limestone, and the largest over the Niagara limestone, near the top of the escarpment. These falls are connected with each other by a longer or shorter series of rapids. In an attempt to reconstruct the preglacial Niagara Valley by the data learned from a study of these creeks, we ascend the valley of Saint David, and find our first fall over the Medina sandstone at the Whirlpool, and the second and third higher up, perhaps somewhere near the present railway bridges. Whether this little stream originally outlined the Falls' islands, must remain a matter of conjecture at present; suffice it to say that beginning at the northerly part of Buffalo, we have a continuous preglacial valley draining northward by the way of the Whirlpool and Saint David, while the lake basin to the south of the Buffalo watershed was at least 750 feet below the top of the limestone terrace, and drained to the west.

Cross Section between Lakes Erie and Ontario.

The geologic section of the Niagara region from Lake Ontario to Lake Erie exposes the following strata of the Silurian: The Medina series, sandstones and shales, distinguished in this section by their bright red color; the Clinton series, shales and limestone; the Niagara shale and limestone; the Salina series, gypsum and shales in varying thickness; the Waterline group. Of the Devonian: the Corniferous and Helderberg limestones. As the strata dip in this section about 20 to 25 feet to the mile from north to south, and our ascent is from north to south, we successively meet all the series from the Medina group to the Niagara limestone as we travel up the gorge along the cut of the New York Central Railroad; but for a comprehensive view of an ideal geologic section the walls of the gorge at Lewiston must be studied. Beginning at the water's edge we have about 230 feet of shales and sandstones of the Medina series, of red color; above this 32 feet of Clinton limestone and shale, of greenish and white col-

or; overlaid by 70 feet of gray colored Niagara shale and 20 feet of drab colored Niagara limestone. This strata of limestone increases in thickness as we ascend the gorge until it reaches about 130 feet at the head of the rapids above the falls. The upper 50 feet of this limestone is thin-bedded and offers but little resistance to erosion, but below these are 70 feet of thick-bedded resistant stone, and the falls rush over the edge of this, making profile of the Falls: compact Niagara limestone 70 to 80 feet; Niagara shale 70 feet; Clinton limestone 10 feet.

Ascending in our geologic series from the Falls southward, we have the valley of Chippewa and Tonawanda creeks excavated from the soft shales of the Salina series; the southern boundary of these valleys consists of bold cliffs formed by the Waterlime, Corniferous, and Helderberg groups, and is succeeded on the south by the erosion of the basin of Lake Erie in the soft shales of the Hamilton group.

With the advent of the ice period the drainage system of the North American continent underwent a change. In the Niagara section the ice, advancing from the north and east, filled the basin of the Ontario Valley, and the streams flowing into it had to find an outlet toward the south. This was undoubtedly the time when the combined Tonawanda and Chippewa creeks, set back on the north, overflowed their southern boundary at Buffalo, the second limestone terrace, and drained into the valley of Lake Erie, 150 below, which overflow finally eroded the present inlet of the river.

The disappearance of the ice sheet in its recession northward gave birth to immense glacial lakes whose northern drainage was stopped by the southern face of the ice. With the constant increase of these water masses by the more or less rapid melting of the ice sheet, the outflow was at different times in different places of the divide to the south by the Mississippi or the Mohawk valleys. At times slowly, at times faster, the level of these glacial lakes lowered; the continent which previous to the Glacial epoch had stood several thousands of feet higher, lowered in a general way and tilted in circumscribed areas. While the ice slowly retreated, the main outlet of the area which covered Lake Erie and its surroundings was by the Wabash River into the Ohio, 200 feet above the present level of the lake. The shore lines of this vast body of water can be traced for hundreds of miles, and like similar shore lines around Lake Ontario, were early chosen for highways or for the founding of settlements.

When finally the lake level had lowered down to Lewiston Height, we would have Lake Erie at about 30 feet higher than at present, pouring its waters in a broad lake-like expansion through the gap at the present site of Niagara Falls and islands, and flowing in a broad expanse over the edge of the escarpment. As Lake Ontario lowered, the overflowing waters found the lowest point in the escarpment near the site of Lewiston and commenced to erode the present gorge. It will hardly do to speak about Falls at Lewiston in the proper sense of the word, because the comparatively thin layer of Niagara limestone on the top with vast masses of soft shale beneath did not offer resistance enough to the immense drainage for

NIAGARA FALLS

the formation of a fall, but made the work of erosion easy and formed a series of rapids as the level of Lake Ontario lowered. This newly formed gorge eating its way southward soon met the ancient channel of the combined waters of the Tonawanda and Chippewa creeks at the present whirlpool, and from here found it easier to erode the drift filled preglacial valley up to the Falls, than to form a new gorge. In this way we can account for the right angle formed by the river between its inlet and its outlet at the whirlpool.

Whether the peculiar short valley at Foster's Flats gives us the place where the great cataract halted for a while divided by an island; whether it was the full force of the present current which produced this peculiar phenomenon, or whether a mass of water, much reduced on account of the tilting of the lake outlets, gives a more satisfactory explanation, must be left to future investigations.

Beyond doubt the immense volume of water eroded its way southward in the preglacial channel. Rapidly obliterating the small fall over the Clinton limestone, it left the fall which originally tumbled over the Medina sandstone as a long series of rapids both at the inlet and the outlet of the whirlpool and traveled to the south along the ancient gorge as one fall. The increasing thickness of the Niagara limestone retarded its southward progress more and more, hence any attempt to speak about the age of the gorge at the present time must be accepted with a wide margin. Receding southerly as one fall until probably opposite the northern end of the American fall, Goat Island and the other small islands on the American side, came into consideration and the Falls divided. The largest volume of water remained in the clearest and deepest channel, westerly of Goat Island, while the lesser volume divided itself among the islands and remained on the American side. From this time on, the Falls, looked upon as one, ceased to travel straight southerly, but swung round in a circle with the northern point of the American fall as the centre. The Horseshoe Fall, owing to its clearer channel and larger volume of water, receded faster, eating away the westerly side of Goat Island, and at present it already swings its way around the southerly side of Goat Island, indicating that at some near future geologic time, it will draw away all the water from the American side, leaving the present American Falls and the islands high and dry and wending its way southerly and easterly again as one cataract.

The oldest drawing and description of the Falls of Niagara have been handed down to us by Father Hennepin, the first white man who saw them, in 1678. He says they are "above six hundred feet high," and we can forgive his exaggeration in view of his enthusiasm, for very few people of to-day, when seeing the falls for the first time, and not having their minds biased by figures, are capable of forming even an approximately correct estimate of the height from which the waters tumble down; one half will over-estimate it immensely, while the other half will err to an equal extent on the other side. Very much depends upon the spot from which the first view is obtained.

The first scientific survey of the Falls was made by Prof. James Hall, State geologist of

New York, in 1842, and his work has formed the foundation of all subsequent surveys. The most interesting part of all these surveys is that they demonstrate the changes which have taken place in recent times in the crests of the Falls. A comparison of the surveys of 1842, 1875, 1886 and 1890 shows that the American Fall has receded at the rate of 0.64 foot per year, or 30.75 feet between 1842 and 1890, and the Horseshoe Fall during the same period 2.18 feet annually, or 104.51 feet in 48 years, a very much higher rate of recession than

Recession of Horseshoe Fall.

was dreamed of prior to the second survey in 1875 and its discussion in 1883. Of course the Falls do not recede evenly, some parts of the crest remain more or less stationary while others change rapidly. The figures above represent the points of greatest activity. The total area of rock surface which has disappeared at the American Fall between 1842 and 1890 represents about 33,000 square feet or three fourths of an acre; at the Horseshoe Fall there has disappeared during the same period 275,000 square feet or 6.3 acres. In all descriptions of the American Fall we speak of one, although there are two; but the second one, the Luna Fall, is so small that it is ignored. It is interesting only as it affords the visitor an opportunity to go in behind the falling waters into the so-called "Cave of the Winds."

Geologists have often indulged in speculations regarding the future of Niagara Falls, and how many thousands of years it would take before the increasing thickness of the Niagara limestone and the decreasing exposure of the soft underlying shales would reduce the height of the Falls to a minimum or even to a mere series of rapids. Judging from present indications, the utilitarian spirit of the age will destroy this wonder of nature long before any changes produced by the natural course of events can mar its beauty or diminish its grandeur. With the discovery of long distance electric transmission there have sprung up, on both sides of the river above the Falls, water power plants for the production of electricity, each one of which robs the Falls of a certain amount of water; these will multiply unless the

NIAGARA FALLS POWER-WORKS—NIAGARA FRONTIER

State of New York and the Province of Ontario co-operate and adopt laws to prevent any additional withdrawal of water by the plants now existing, as well as by the formation of new power companies.

Twenty years ago New York State paid \$1,500,000 for the present reservation and placed it under State control "to preserve the scenery of the Falls of Niagara, for in all that is grand and sublime in the works of nature, there resides a power to educate and refine which is of inestimable worth." The Province of Ontario took the same course very soon after; and it behooves the present century to see to it, by the most stringent laws, that this sublime legacy of the last century, the Reservation at Niagara, American and Canadian, is handed down to future generations unimpaired by commercialism and fit to fulfil its grand mission among the educational forces of the world, for the waters of the Falls of Niagara do not belong to a few companies, or to New York State or to the Dominion of Canada, but they belong to mankind, irrespective of nationality or color.

Dr. JULIUS POBILMAN,

Late Professor University of Buffalo.

Niagara Frontier, common designation of the region bordering the Niagara River, 37 miles long, between Lakes Erie and Ontario, presenting features of exceptional scenic, scientific, historic, political and industrial interest.

Geographical and Scenic.—The general course of the Niagara is a little west of north, through a flat country from Lake Erie north for more than 20 miles. Some seven miles south of Lake Ontario, in the main parallel with it, in the Niagara region, is an abrupt declivity, approximately a prehistoric shore-line, the country north of it being some 400 feet lower than the general level to the south of it. From this escarpment to Lake Ontario the country is exceedingly fertile, famous for its peach, quince, plum, and apple orchards, and other fruits. Through this section the river flows with a slackened current, between alluvial banks. From the escarpment, southerly, the river has cut a gorge 200 to 400 feet deep, back seven miles, through which the Falls of Niagara have receded to their present position. This portion of the river is, except for a navigable mile below the Falls, a wild rapid, and includes the Niagara Whirlpool. From Lake Erie to within a mile of the upper rapids, less than two miles from the cataract, the Niagara is navigable. At the northern limits of the city of Buffalo, it branches, embracing Grand Island, area 17,381 acres (8 miles long, 6 miles wide), a township of Erie County, N. Y. The international boundary line lies in the middle of the river, following the west channel and passes through the apex or principal angle of the Horseshoe Fall. With the exception of Navy Island, which belongs to Canada, in the west channel near the foot of Grand Island, the islands belong to New York State; principal ones are Squaw, Rattlesnake, Strawberry and Cayuga, New York side; Beaver, near head of Grand Island; Buckhorn, foot of Grand Island; and Tonawanda. The Niagara receives, from the east, Gill, Cayuga, Tonawanda and Senajaguda creeks, the last-named flowing

through the city of Buffalo and making its principal Park Lake. (See BUFFALO.) From the west, the Welland is the chief tributary, an important navigable route in pioneer days, and still popular with canoeists.

The scenically famous part of the Niagara begins, on the north, at the edge of the escarpment, and runs southerly seven miles, culminating in the great cataracts. The general form of the precipice over which the river plunges is that of an irregular horseshoe, divided by Goat Island. The eastern or American Fall has nearly a straight contour line, width 1,060 feet, height 167 feet. Luna Island separates a small part of the American Fall, on the Goat Island side, from the main body. Behind this Luna Fall is the Cave of the Winds, a natural chamber eroded by the water (projected against the cliffs by air-blasts) about 100 by 75 feet in dimensions. The gorge opposite the American Fall is 1,250 feet wide. The Horseshoe or Canadian Fall, the grandest single feature of the Niagara region, was in 1890, 3,010 feet long; continued recession has no doubt increased the length; the height at the apex of the curve is 158 feet. Adjoining the cataracts on both American and Canadian sides are groups of islands, surrounded by rapids, presenting many minor features of great beauty and interest. On the American side, Green Island (formerly Bath), Goat, the Three Sisters, Little Brother, Ship, Brig, Robinson, and others (the last four named inaccessible to visitors) are included, with a strip of the mainland 106 acres in all, in the New York State Reservation. On the Canadian side, Cedar Island and the Dufferin Islands, above the great fall, are a part of the Queen Victoria Niagara Falls Park. About three miles below the Falls the river turns from northwest to northeast and at the elbow forms the Whirlpool, of greater interest to the geologist than to the casual tourist. Between the Whirlpool and the end of the gorge, points of interest are, on the New York side, the Devil's Hole, a wild ravine, lateral to the main gorge; and on the Canadian side, Niagara Glen, formerly Foster's Flats. The view from the edge of the escarpment, Canadian side, overlooking the village of Queenston and the low interval to Lake Ontario, is celebrated.

The level of Lake Ontario is 326 feet below Lake Erie; from Lake Erie to the rapids above the Falls, the descent is 10 feet; from the beginning of the rapids to edge of American Fall, 49 feet; from foot of American Fall to Lake Ontario, 100 feet. The discharge of the river is estimated at 15,000,000 cubic feet per minute, or one cubic mile per week.

On the edge of the escarpment two and one half miles east of Lewiston is the Tuscarora Indian reservation, 5,769 acres; a well-to-do farming community of descendants of the Tuscaroras who, being refugees from the South, joined the Five Nations Indians in 1715.

Geological.—The floor of Lake Erie at the mouth of the Niagara is Corniferous limestone. The dip is to the south, and as one proceeds northerly on the course of the river there are successively exposed the Onondaga and Corniferous limestones, the Salina group, including the hydraulic limestone; Niagara limestone, Clinton shales, Medina sandstones (upper gray, red, and gray quartzose), and red shales and sandstones, extending to Lake Ontario. Esti-

NIAGARA FRONTIER

mates by careful students as to the time occupied by the falls in cutting the gorge from the escarpment to their present position vary from 5,000 to 50,000 years. Only since 1842 are there reliable data of recession. In that year James Hall, New York State geologist, made a trigonometrical survey of the Falls, marking the stations of observation with permanent monuments. Recent observations show that for the 48 years prior to 1890 the mean retrogression of the American Fall has been 7.68 inches per year; of the Horseshoe Fall 26.16 inches; a total area of recession for the American Fall of about three fourths of an acre, and for the Horseshoe Fall, of 6.32 acres. Erosion goes on most rapidly at the apex of the Horseshoe Fall.

Botanical.—The flora and silva of the Niagara region are remarkable only for the large number of species found in a small area. On the New York State reservation (106 acres), and in the immediate neighborhood of the river, have been found 909 species of flowering plants, ferns and other cryptogams, 758 of which are native. Goat Island (13.9 acres) is especially rich in species. Here, and at a few other stations in the vicinity, occurs *Hypericum Kalmianum*, L., which perpetuates the name of Peter Kalm, a Swedish botanist whose description of Niagara after his visit in 1750 is valuable. Among the ferns of the Niagara gorge, rare or not occurring elsewhere in Western New York, are the walking-fern, *Campiostrum rhasophyllus*, Link., *Aspidium Lonchites*, Swartz, and *Aspidium Bootii*, Tuckerm., ferns whose accustomed range is a hundred miles northward; also *Pellaea gracilis*, Hook., and *P. atropurpurea*, Link. The only cissampas trees of the region grow at the Whirlpool.

History.—The world's first knowledge of Niagara Falls and river was had from Samuel de Champlain's work, 'Des Sauvages,' 1604; but Champlain never saw the cataract, basing his allusion on reports of Indians. The oft-repeated statement that Jacques Cartier, in 1535, was the first white man to hear of the Falls is disproved, it being shown that statements attributed to him, and quoted by Marc Lescarbot ('Histoire de la Nouvelle France,' 1609), are really from Champlain's work of 1604. The first known visit of white man to the Niagara region was that of Joseph de la Roche Dallion, a Franciscan, who attempted missionary work in the Niagara peninsula in October 1626, and appears to have crossed the river, from west to east, near Lewiston. Two priests of the Society of Jesus, Jean de Brébeuf and Joseph Chaumonot, visited the Indians in the Niagara region, 1640-1; the Sulpicians, François Dollier de Casson and René de Bréhan de Galinée, passed the mouth of the Niagara, July 1669; but they did not explore the Niagara, entering Lake Erie by the Grand River, to the westward. With them was René Robert Cavalier, known as La Salle, who turned back, and seems to have become familiar with the Niagara region in that year. In December 1678, La Salle again came to the Niagara, and above the Falls built the Griffon, the first craft larger than a bark canoe, to navigate the upper lakes. The Griffon sailed 7 Aug. 1679; the site where the vessel was built, near the present village of La Salle, N. Y. (pop. 661), is marked with a large boulder and bronze tablet, suitably inscribed. With La Salle was Father Louis Hen-

nepin, a Franciscan (Recollect), whose book ('La Louisiane,' 1683) contains the first detailed description of the Falls. The first picture of Niagara Falls is in the 1704 edition of Hennepin's 'Nouvelle Découverte,' etc., first published 1697. La Salle was several times on the Niagara, as were his lieutenant Tonty and other followers of historic fame. La Salle made no permanent establishment, his attempted fort at the mouth of the river (Fort Conti), his stockade at Lewiston and house above the Falls being soon destroyed. In 1687 the Marquis de Denonville, after a campaign against the Iroquois in Central New York, came to the Niagara and built a fort at the mouth of the river, east side, called it Fort Denonville, and garrisoned it with 100 men. Sickness depleted the garrison and in 1688 the post was abandoned. No attempt to re-occupy the region was made by the French until 1749, when Chabert de Joncaire the elder built a trading hut at the present site of Lewiston. In 1725-6 Fort Niagara was built at the mouth of the river, and for 34 years it was the centre of French influence throughout a wide region, an important link in the chain of posts by which the subjects of Louis XIV. sought military and trade control of the Lakes and Ohio Valley. The original mess-house or "castle," somewhat modified, is still standing, probably the oldest building in the northern United States west of the Mohawk; two other buildings of the French period remain, adjoining. French domination on the Niagara ended 25 July 1799, when Fort Niagara and dependencies were surrendered by Captain Pouchot to Sir William Johnson.

Under the British, the Niagara was a centre of British-Indian alliance until the close of the Revolution. During the period of Pontiac's uprising, a band of Indians ambushed and massacred a British force returning from Fort Schlosser above the Falls to Fort Niagara, also a relieving force, in all about 100 men. This affair, 14 Sept. 1763, took place on the banks of the Niagara at the Devil's Hole ravine, into which many of the victims were thrown or driven alive. It was the last Indian demonstration against the British in this region. From the outbreak of the Revolutionary War parties were sent from Fort Niagara against the frontier settlements of New York and Pennsylvania. Here were planned the expeditions which resulted in the massacres of Wyoming, Cherry Valley, Bowman's Creek, and others. Sullivan's retaliatory expedition of 1779, against the Senecas of Central New York, drove in upon the British at Fort Niagara some 5,000 refugees, who became dependents on the British. To relieve this burden, the British, until the close of the war, were zealous in equipping and despatching from Fort Niagara scalping parties against the American settlers in the Mohawk, Susquehanna, and other frontier sections. Several hundred of the Senecas who fled from Sullivan, summer of 1779, settled the next spring on Buffalo Creek, thus making the first Indian village on the present site of Buffalo. (See BUFFALO.) The British maintained a garrison at Fort Niagara, and virtual control over the whole region, until 11 Aug. 1796, or for 13 years after the close of the war. During this "hold-over" period the present town of Niagara, Ont., at the mouth of the river, west side, was settled, beginning 1783, with people from the United States who re-

NIAGARA FRONTIER

mined loyal to Great Britain. These United Empire Loyalists, many of them families of culture and energy, gave a high character to society in the district, still maintained by their descendants. The development of the Canadian side of the Niagara was begun earlier than that of the New York side. Lieutenant-Governor Simcoe made Niagara the capital of Upper Canada (now Ontario) in 1792, the seat of government being moved to York (Toronto) in 1796. Queenston, Canada, opposite Lewiston, was founded as West Landing, 1789, by Robert Hamilton; in 1792 named by him Queenston, in honor of Queen Charlotte.

The War of 1812 paralyzed the development of the region, and the banks of the Niagara became the theatre of the most important land conflicts of that war on the northern frontier. On 12 Oct. 1812 the Americans under Van Rensselaer attempted to gain the heights at Queenston; owing largely to cowardice and insubordination of the militia the attempt failed, and the Americans were defeated; the British commander, Gen. Isaac Brock, was killed in the engagement; Winfield Scott, of the American regulars, was taken prisoner. On 13 May 1813, the American land forces under Dearborn and naval forces under Chauncey operated together against Fort George, nearly opposite Fort Niagara. Dearborn falling ill, the command devolved upon Scott. Fort George was taken, with the nearby village of Newark (Niagara-on-the-Lake). The British posts at Chippewa and Fort Erie were abandoned, and the entire Canadian frontier from Lake Erie to Ontario was in the hands of the Americans. In December the British compelled the evacuation of Fort George. The American general, McClure, in retreating, blew up the fort and burned Newark. In retaliation, the British crossed the river, captured Fort Niagara, and burned and laid waste the entire American frontier, the villages of Youngstown, Lewiston and Tuscara, culminating in the destruction of Black Rock and Buffalo, 30-31 Dec. 1813. On 3 July 1814, the Americans under Scott and Ripley captured Fort Erie. On 5 July, at Chippewa Creek, the Americans were again victors. On 25 July was fought the battle of Lundy's Lane, also called Bridgewater or Niagara Falls, overlooking the cataract. The Americans, with a total force of less than 2,600, attacked the British (4,300, with nine pieces of artillery) and carried their position. Both Brown and Scott being wounded and carried from the field, command devolved on Gen. Ripley; before morning of the 26th, the British rallied, reoccupied their position, and claimed a victory. British losses stated in official returns as 876 killed, wounded and missing; American, 861; but historians give widely varying figures. The Americans retired to Fort Erie and fortified it. On August 3 they were besieged by the British General Drummond, 1,700 men; on the 15th, during an assault, the explosion of a magazine threw the British into confusion and they withdrew with heavy loss. On 17 September the beleaguered Americans made a sortie, one of the most brilliant movements of its kind in military history, capturing the works of the British and forcing them to abandon the siege. This was the last important engagement of the war on the Niagara Frontier, peace being restored by the Treaty of Ghent, 24 Dec. 1814.

From 1800 the American side of the Niagara

was opened for settlement under the operations of the Holland Land Company, which founded New Amsterdam, now Buffalo. Black Rock, four miles from Buffalo Creek, was merged in Buffalo in April 1853. The opening of the Erie Canal, 1825, gave great impetus to the whole region. The towns of Tonawanda (q.v.) and North Tonawanda (q.v.) owe their origin to the canal, and are now important as a point of lumber manufacture and of cargo trans-shipment from lake vessels to cars and canal-boats. Niagara Falls, N. Y. (formerly Manchester), now embracing Suspension Bridge (pop. 19,457) has evolved from its long-famous aspect of a tourist resort to a unique position among manufacturing towns. Lewiston (pop. 697), named for Gov. Morgan Lewis, on the site of La Salle's stockade of 1678, was a place of some importance prior to the railroad era, and a station on a much-traveled highway to the West. It now shares in the general immunity from business which characterizes Youngstown (pop. 547), five miles below, and Niagara and Queenston, opposite; the shipment of fruit and farm produce and the care and transportation of tourists are the chief industries of these old towns on the lower river. Fort Niagara, at the mouth of the river (reservation 268 acres), is a United States military post with modern buildings, rifle range, etc. Here are also standing several structures of the British and French periods of occupancy. The old magazine (1757) in which William Morgan was confined in 1826, for his anti-Masonic publication, is still shown. The Canadian side of the Niagara has no large town, the villages of Niagara-on-the-Lake (Ontario), Queenston opposite Lewiston, Saint David's, three miles west of Queenston, Stamford, one mile from the Whirlpool, Niagara Falls, Ont. (Drummondville), Chippewa, Bridgeburg and Fort Erie (formerly Waterloo), being either quietly rural or devoted to tourist and railroad interests.

Grand Island, a township of Erie County, a farming community, with numerous country seats, clubhouses, hotels and resorts on the shores, was the proposed site of Ararat, City of Refuge for the Jews, which Maj. Mordecai Manuel Noah zealously advocated. A cornerstone for the new city was prepared, 1825, but the project came to naught. Tonawanda Island, in the American channel opposite Tonawanda Creek, is almost wholly covered with lumber yards and mills; connected by bridge with the mainland. Navy Island (304 acres), in the Canadian channel, was the principal rendezvous of William Lyon Mackenzie and his followers during the uprising of 1837-8 known as the Upper Canada Rebellion, or Patriot War; the principal event of which on the Niagara was the burning of the steamer Caroline, in service for the rebels, by the Canadians, 29 Dec. 1837. Fort Erie village, near the ruined fort of the same name at outlet of Lake Erie, and Ridgeway, a few miles inland, were the field of exploit by the Fenians whose attempted raid into Canada was quickly suppressed, 1-12 June 1866.

Bridges.—The Niagara River is spanned by several notable bridges. The International (railway only), at Buffalo, was built by Sir Casimir Stanislaus Gzowski and Sir David L. Macpherson; begun 17 June 1871, opened for trains 3 Nov. 1873. It is of truss construction, 3,651½ feet long, supported by eight piers, three

NIAGARA FRONTIER

of 197 feet span, three of 248 feet, and a double draw 362 feet long. The piers are in water from 9 to 48 feet deep, with a current varying from 5 to 12 miles an hour, the level of the river and the velocity of the current being chiefly affected by wind, which raises or lowers Lake Erie, the outlet of which is three and one half miles above the bridge. Originally of single-track width, it was widened and its capacity doubled, 1901-3. The upper steel arch bridge, below the falls, occupies the place of a suspension bridge, built 1869, destroyed by a gale in 1889, restored as a suspension bridge, and in 1895 replaced by the present structure, 1,240 feet long, height of floor above water 192 feet, width of floorway 46 feet, length of arch span 840 feet, said to be the longest bridge of its kind. One and a half miles below, spanning the gorge at the origin of the upper whirlpool rapids, is the steel cantilever bridge of the Michigan Central Railroad, built 1883; length 910 feet, height above water 245 feet; for railway only. A few rods below it is the lower steel arch bridge of the Grand Trunk Railway, which replaces the suspension bridge built by J. A. Roebling in 1858. The present structure, completed 1897, is 1,080 feet long, with a centre span 550 feet, the centre of the arch 226 feet above the water; upper track for railway, lower for carriage and foot passengers. At the north end of the gorge, between Lewiston and Queenston, a suspension bridge was erected 1899, replacing the first suspension bridge across the Niagara, built here in 1851 by Capt. E. W. Serrell, and destroyed by wind 1864. The present structure has a cable span of 1,040 feet, suspended span 800 feet, height above river 65 feet, opened for traffic 1889; one floor for foot, carriage and electric railroad traffic.

The scenery of the vicinity of the Falls was rescued from vandalism and proprietary greed by the action of New York State and the Government of the Dominion of Canada. Many enlightened minds had regretted but were powerless to stay the deterioration of the environs, long before the meeting in 1878 of Gov. Robinson of New York and Lord Dufferin, then Governor-General of Canada. To the latter is ascribed the first official expression which led to legislative action in both countries, for the preservation of Niagara. In 1884 New York State paid \$1,433,429.50 for Prospect Park, adjacent lands bordering the river, Goat and other islands; which now constitute the New York State Reservation at Niagara Falls, opened to the public 15 July 1885. The wise policy of the State has been to restore the environment to a condition of nature, with as little artificial work as consists with its use and enjoyment by the public. The park is free, maintenance coming from rentals of concessions and a modest annual appropriation from the State. The park is visited by more than half a million people yearly. The Queen Victoria Niagara Falls Park, on the Canada side, embraces 154 acres in the vicinity of the falls, including the Cedar and Dufferin islands, bought by the Dominion Government in 1885 for \$436,000; and also, subsequently acquired, a strip 66 feet wide along the river from Queenston to Fort Erie, about 90 acres at Niagara Glen (Foster's Flats), 100 acres at Queenston Heights, including the battle-field, and the site and ruins of Fort Erie. Franchises, especially to power plants, produce a large income.

By thus controlling the entire river front from Fort Erie to Queenston,—over 20 miles—the Dominion Government led the van for the preservation of historic sites on its frontier.

Fort Erie (built by the British under Brackenstreet, 1764, present ruins dating from 1805-14), at Chippewa, and Queenston, battle-fields of the War of 1812 are preserved. On Queenston Heights is the Roman composite column in memory of Maj.-Gen. Sir Isaac Brock; a fluted shaft on a square pedestal, surmounted by a statue, the whole structure 190 feet high; a stairway of 235 steps leads to a gallery at the top. It stands 250 feet above the river; and in its vaults were reinterred, 13 Oct. 1853, the remains of Brock and of Lt.-Col. John McDonnell. The shaft replaces an earlier and more modest monument, destroyed by miscreants, 16 April 1840. Near the foot of the hill is a small monument marking the spot where Brock fell; it was unveiled by Albert Edward, Prince of Wales, 18 Sept. 1860. At Lundy's Lane, near the Falls, but not included in the Government reservation, the burying ground contains numerous monuments to the soldiers who fell there. Similarly historic are the cemeteries at Niagara, Ont., Fort Niagara and Lewiston. Numerous historic sites on the American side have been marked by bronze tablets erected by the Niagara Frontier Landmarks Association.

Utilization of Power.—Competent estimates place the potentiality of the Niagara current at 7,000,000 horse-power. After many years of more or less impracticable schemes, Thomas Edison developed a plan which became the basis of the present successful undertaking to use the power on a large scale. In June 1890 an International Niagara Commission was established, authorized to offer prizes amounting to \$22,000 for the best plans for the purpose. For turbines the designs of Faesch and Piccard of Geneva were selected, and three experimental wheels were built from their plans by the I. P. Morris Co., Philadelphia. Two-phase alternating current dynamos with revolving fields were adopted, three were made and installed by the Westinghouse Company, Pittsburg. The plan included a surface canal 250 feet wide, 12 feet deep and 1,700 feet long, extending laterally from the river. Parallel with this a wheelpit was dug 425 feet long, 18½ feet wide and 178½ feet deep. This work was about a mile above the Falls. From the base of the wheelpit a tunnel was made, 18 feet 10 inches wide, 21 feet high and 6,837 feet long, emptying into the river below the Falls. For the first 5,000 feet from its lower end the grade is .7 per cent; thence to the wheelpit .4 per cent. Construction of the tunnel was begun 4 Oct. 1890. Ten turbines, each of 5,000 horse-power, were installed in the pit, steel penstocks 136 feet long and 7.5 feet diameter carrying the water to them, the great tunnel serving as tail-race. Each turbine shaft, connected with the generators above, weighs, with connected parts, 150,000 pounds, and is so supported by the upward thrust of the column of water in the penstock that it revolves without friction on its bearings. The original installation of ten wheels and dynamos was more than duplicated, 1901-2, by the construction of a new wheelpit 463 feet 8 inches long, 18½ feet wide, 178½ feet deep; connected with the old pit by a passage 130 feet below the surface. The discharge tunnel was extended 600

NIAGARA INTERNATIONAL PARK — NIAS

feet to the new pit, making the total length of the tunnel 7,437 feet. The new power-house and pit are planned for the installation of 11 turbines and dynamos, each unit of 5,000 horse-power, a total production at this point of 105,000 horse-power. The turbines in pit No. 2 are of the internal discharge type, claimed to add 10 per cent to the effective head. Two types of generators are used: (1) an external field type with nickel steel revolving magnet ring; (2) an internal revolving field type, wound for 2,300 volts, 25 cycles, 2-phase, operated at 250 revolutions per minute.

Power operations on the Canadian side were actively begun August 1902, with the construction of a plant to develop 110,000 horse-power. A notable innovation was the use of dynamos of 10,000 horse-power each. In April 1902 the Dominion Government granted rights to the Ontario Power Company, which then planned to develop 150,000 horse-power. Instead of discharging by a tunnel, the water is received in flumes, carried to the brink of the gorge and dropped to the lower river through penstocks. The first two companies to begin operations at this point were backed largely by United States capital; a third company, largely Canadian, has been granted rights, the present plans of the three companies contemplating a total production at this point of some 600,000 horse-power. The Canadian Government exacts in all cases that 50 per cent of the power developed must be supplied to Canadian consumers if called for, the rest may be exported to the United States. On the American side, in the vicinity of the power-houses, a score or more of industries have located, chiefly employing smelting, electrolytic and chemical processes, and using in the aggregate about 25,000 horse-power. The International Railway system (electric) operating throughout the whole frontier, as far east as Lockport and to stations in Buffalo, some of them 32 miles from the generators, is a notable instance of the distributed use of Niagara power, which is also largely supplied for manufacturing establishments in Buffalo and elsewhere. Far-reaching plans are made for railway operation and factory supply on the Canadian side, and great developments are predicted for the near future. At Niagara Falls, N. Y., electric power is supplemented by hydraulic power. The original power canal, built 1853-8, has been much enlarged, notably since 1892, and now has a working capacity of 100,000 horse-power. Numerous establishments relying on this system use some 20,000 horse-power, with prospective increase. The industrial growth of the Niagara region in the past decade has been great, and indications point to still greater development in the coming decade. Public apprehension that the scenic features of Niagara will be impaired by the diversion of water for power purposes, is not borne out by test observations, the variation in the flow of the cataracts due to a change of wind often being far greater than any deemed possible under present power operations.

FRANK H. SEVERANCE,
Secy. Buffalo Historical Society.

Niagara International Park, on both sides of Niagara River at Niagara Falls, a reservation for public purposes established by the joint action of the legislature of the State of New York and the parliament of the Dominion of Canada. See NIAGARA FRONTIER.

Niagara-on-the-Lake, Canada, a town of Lincoln County, Ontario, at the mouth of Niagara River, on the west bank, twelve miles below Niagara Falls, and 36 miles by water from Toronto. It is a pleasant summer resort. It was burned down in midwinter 1843, by the Irish-American General McClure during his retreat, an unnecessarily savage action that was deplored by both sides and led to cruel reprisals. Pop. about 1,500.

Niagara Series, in geology, the earliest strata of the Upper Silurian era, preceding the Onondaga Series and the lower Helderberg Series. It, in turn, is subdivided into the strata of the Medina epoch, those of the Clinton group, and those of the Niagara formation. None of these three is continental in extent, but all are important, are very rich in fossils, and consist of sandstones, limestones, and shales. The Medina formation is made of Oneida conglomerate, a hard, light gray rock made up of quartz pebbles and sand, and covering Herkimer, Oneida, and Ulster counties, New York, a part of Virginia, and east Tennessee; and of Medina sandstone in western New York. The Clinton formation, shaly sandstone in New York and Pennsylvania, and more completely limestone further west, occurs in Ohio, Indiana, Wisconsin, Tennessee, Kentucky, Alabama and Georgia; and is marked by the occurrence of oolitic argillaceous hematite. The Niagara formation is a thick limestone, underlain with shale; the wearing away of the latter undermines the limestone as at Niagara Falls. The Niagara group occurs in New Hampshire, Connecticut, Ohio, Illinois, western Tennessee, northern Kentucky, Missouri, Arkansas, and (scantly) in the Rockies. The fossils of the series are mollusks, corals, crinoids, etc.; apparently there are no land or fresh-water animals.

Niagara University, a Roman Catholic theological institution at Niagara Falls, N. Y. (q.v.), founded by the priests of the Congregation of the Mission in 1856. In 1910 there were connected with the school 30 professors and 325 students. The library contains about 13,000 volumes; the grounds and buildings are valued at \$50,000. The students come from all parts of the country, and after ordination return to their respective dioceses.

Nian'ic Indians. See NARRAGANSETT INDIANS.

Nias, nê-âs', Dutch East Indies, an island in the Indian Ocean, off the southwest coast of Sumatra, from which it is separated by a strait 60 miles wide. It is about 70 miles long, 20 miles average breadth, area 2,100 square miles. The surface is mountainous, attaining a maximum altitude of 1,970 feet. In 1857 when the Netherlands took possession of the island, the population was reckoned at 17,000. The Niasers are of the Malay race, but fairer than the usual type. They are industrious and frugal, expert handicraftsmen, temperate and regular in their habits, but inclined to be avaricious, vindictive, and sanguinary. The chief vegetable products are rice, coconuts, bananas, tobacco, sugarcane, etc., and annually about 110,000 pounds of pepper. Hogs are reared, and there is a domestic

export trade with Sumatra in rice, yams, beans, and poultry. Pop. est. 200,000.

Nia'ta, or **Nata**, a breed of Argentine cattle, which long ago started among the Pampas Indians, and is now nearly or quite extinct. They were really deformed, the parts of the face being so out of proportion as to give the face a queer pug-like appearance. They were very interesting to the students of evolution as an example of a variant which maintained its peculiarities through a long period, breeding "true," and showing no reversion to the normal type.

Nibby, **nēb'bē**, **Antonio**, Italian antiquarian: b. Rome 1798; d. there 1839. He was one of the founders of the Academy of the Tiber and in 1814 was secretary to Louis Napoleon. He later became professor of archaeology in the College of Rome and in the School of France. He wrote: 'La Grecia di Pauzania' (1817-18); 'Elementi di Archeologia' (1828); 'Album di Roma' (1834); 'Analisi Storico-topografico-antiquaria della carta de contorni di Roma' (1837-8); etc.

Nibelung, **nēb'ē-loong**, in Scandinavian mythology, a monarch whose subjects are called Nibelungs and territory the Nibelungenland. There were two contemporary kings in this realm, against whom Siegfried, Prince of the Netherlands, fought. He slew the 12 giants who formed their paladins with 700 of their chiefs. The word Nibelungen is from *nebel* (darkness), and means the children of mist or darkness.

Nibelungenlied, **nēb'ē-loong'en-lēt**, **The** (Song of the Nibelungen), or **NIBELUNGEN NOTH** (Nibelungens' Need), an ancient German epic, ranking among the noblest works of imagination. The subject of this great epic is the dreadful fate of the Burgundians, caused by the passion of two princely pairs. The one pair are Siegfried, son of King Sigismund of Santen on the Rhine, and Chriemhild, sister to Gunther, king of Burgundy, the other are Gunther and Brunhild, a heroine of the fabulous North. Siegfried—as noble a hero as ever was depicted—is beloved by Chriemhild. Her brother Gunther is enamored of Brunhild of Iceland. But the northern princess can only be won by force. A successful suitor must conquer her in combat. Gunther promises Siegfried his sister's hand if he will aid him in gaining Brunhild. Siegfried, by means of a cloak which renders him invisible, is enabled to assist Gunther in his encounter with Brunhild, whom he vanquishes and marries. On the night of her nuptials, however, Brunhild has another struggle with Gunther, in which she overcomes him. Siegfried a second time reduces her to submission, and takes from her her girdle and ring, in which lay her power. These he gives to Chriemhild, who after an interval of ten years, in a quarrel with Brunhild, shows her those trophies of her defeat. Brunhild resolves on vengeance, and persuades Hagen of Tronege to murder Siegfried, which he effects with the privy of Gunther. Chriemhild, after 13 years passed in widowhood, in pursuance of a project of vengeance marries the heathen Etzel. After another interval of 13 years, in which Chriemhild gives a son to Etzel, she invites the Burgundians or Nibelungen to the court of Etzel, involves them in strife with the Huns, and after several bloody battles both parties are destroyed. Gunther

and Hagen, the sole survivors, surrender to Dietrich of Bern, an ally of Etzel, who delivers them to Chriemhild, with an injunction to spare their lives. She puts them both to death, and she in turn is killed by a vassal of Dietrich. The poem thus ends in a terrible scene of fire and bloodshed. The time in which we find the historical basis of this tragedy is about 430 or 440 A.D.; the scene is on the Rhine, and on the frontiers of Austria and Hungary. The story of the Nibelungenlied belongs to the general body of Germanic and Scandinavian mythology, and it may be traced in the myths of others of the Aryan nations. The author of the poem is not known for certain. Some have attributed it to Henry of Ofterdingen or to Klingsohr of Hungary, but recent investigations make it probable that an Austrian knight was the author (about 1140). The poem does not appear to have been so popular as some others, and after the 16th century it fell into oblivion, so remaining until 1751, when some considerable portions of it were published by Bodmer. Lachmann, in his edition of 1826, first made it the subject of scientific criticism; but his views have not been sustained by later critics. The Saint Gall text, which he regarded as a later redaction, is now considered the best, and the Nibelungenlied is regarded not as a compilation, but as an organic whole, composed by one author, who derived his materials from the rich stores of song and legend which were the common possession of the German people.

German critics speak highly of the Nibelungenlied, and prefer it in many respects to the Iliad. The language of the Iliad is, they admit, superior to that of the Nibelungenlied both as to the idiom itself and the masterly with which the Greek poet wields it, though the German epic has a childlike and venerable simplicity. On the other hand, they argue that the plan of the latter is vastly superior to that of the former. It is a great plan, from beginning to end, and embraces a whole event; the Iliad but a part of an event. The Nibelungenlied marks the culmination of the great process which had made Rome a German empire, and had transformed the invading hordes into a highly civilized people. Not only by reason of its splendid poetic and dramatic power, but also as a monument in the history of the human race, the Nibelungenlied takes rank among the great national epics of the world's literature.

Niblack, **Albert Parker**, American naval officer b. Vincennes, Ind., 25 July 1859. He was graduated from the United States Naval Academy in 1880; served with an expedition of survey and exploration to Alaska in 1884-8; was inspector of naval militia in 1893-6; and writer and lecturer on signaling and naval tactics at the Naval War College in 1893-6. He was then naval attaché at Berlin, Vienna, and Rome till the Spanish-American War; during this war he served on the blockade of Spanish ports, being engaged in the battle of Nipe Bay. In 1898 he was transferred to the Philippines and took part in the suppression of the native insurrection; and in 1901 was appointed secretary of the naval commission in the Philippines. He has written 'The Coast Indians of Alaska and Northern British Columbia' (1889).

Niblo's Garden, a former theatre in New York, in Broadway, near Prince Street. It was

NICAEA — NICARAGUA

opened in 1838 under the name of the Sans Souci and a year later was a concert garden. Niblo's theatre was opened in 1839 and was demolished in 1895.

Nicea, *ni-sâ's*, or **Nice**, *Asa Minor*, an ancient city, capital of Bithynia, on the east shore of Lake Ascania, 45 miles southeast of Byzantium, its site now occupied by the village of Isnik. As *Ancora* or *Hellscora*, it is said to have been colonized by Borsotiana, and destroyed by the Mysians. Antigonus rebuilt it 316 A.C., and named it *Antigonea*; but Lysimachus, having conquered this part of Asia, changed its name to *Nicea*, in honor of his wife *Nicea*, daughter of Antipater. Under the Roman Empire it retained long an exalted rank among the eastern cities, and is renowned in ecclesiastical history for the famous councils held here in the reign of Constantine (325 A.D.), and by desire of the Empress Irene 785 A.D. In the year of the first council *Nicea* was overthrown by an earthquake; it was restored by Valens in 368. After the foundation of the Latin Empire in Constantinople in 1204 the Greek Emperor Theodorus Lascaris made *Nicea* the capital of his empire, which it continued to be until in 1261 the Greek emperors recovered Constantinople. It was finally taken by the Turks in 1330.

Nicea, or **Nice**, The Council of, an ecclesiastical council held at *Nicea*, in *Nicomedia*, in 325. Of the method of summoning the first oecumenical council Gibbon says, "The archbishop or metropolitan was empowered by the laws to summon suffragan bishops of his province, to revise their conduct, to vindicate their rights, to declare their faith, and to examine the merit of the candidates who were elected by the clergy and people to supply the vacancies of the episcopal college. The primates of Rome, Alexandria, Antioch, Carthage, and afterward Constantinople, who exercised a more ample jurisdiction, convened the numerous assembly of their dependent bishops. But the convocation of great and extraordinary synods was the prerogative of the emperor alone." Constantine before his conversion convened a council at *Aries* (314 A.D.). The object of the Council of *Nice*, likewise convened by him, was to settle the controversy which had arisen in regard to the divinity of Christ, and to contradict and condemn the views of Arius. The bishops who attended the council are variously estimated: Gibbon gives 318; Eusebius, 250; other early authorities, 300 and 320. The Eastern bishops attended in person; the Western Church was represented by seven delegates, the most important of whom was Hosius of Cordova, who attended and presided as the pope's delegate. The number of ecclesiastics of all kinds present was over 2,000. The session lasted about two months. It was frequently attended by the emperor in person. According to some accounts the earlier sittings were very stormy, and Constantine had to use much address to reconcile the disputants. Finally the council declared it to be and to have ever been the teaching of the church Catholic, in conformity with the apostolic tradition in all the churches, that Jesus Christ, the Son of God, is "consubstantial" — of the same substance or nature — with the Father: and accordingly in the creed called of *Nice* (otherwise the *Nicom-Constantinopolitan* creed)

are the words, predicated of the son of God *consubstantialis patri*, the word *consubstantial* being a rendering of the Greek word of precisely the same meaning and of analogous formation, *Homoousios*.

Though the membership of the Council of *Nice* was, as already said, almost wholly eastern, nevertheless, its president was Hosius, who represented the western empire of Rome. Gelasius, bishop of Caesarea, in Palestine, in his history of that council writes of the presence there of Hosius and that he was the delegate of Silvester, bishop of Rome (in the Latin version, *Silvestri episcopi maxime Romæ locum obtinebat*); and naturally enough Hosius' name is the first among the signatures of the bishops to the Council's decrees. See **COUNCIL**.

Nicander, *ni-kân'dér*, Greek physician and poet of the 2d century A.C. He was born in Claros, near Colophon, in Ionia; was hereditary priest of Apollo in his native city; and may have spent part of his life in Italy. He wrote various didactic poems now lost; one of these was Virgil's model for the 'Georgics,' and another the 'Heterœumena' or 'Transformations,' suggested Ovid's 'Metamorphoses.' 'Theriaca,' on dangerous wild animals, and 'Alexipharmaca' on antidotes, his two extant works, were edited by Schneider (1816 and 1792).

Nicaragua, *ni-k-ä-rä'gwä*, or *nä-kä-rä'gwä*, Republic of, a country of Central America, bounded on the north by Honduras, on the east by the Caribbean Sea, on the south by Costa Rica, and on the southwest and west by the Pacific Ocean. Its area, according to conservative estimates, was formerly given as 40,000 square miles; including Mosquitia (see next paragraph) it is approximately 49,000 square miles.

Political Divisions.—The departments enumerated in the presidential decree of 12 Dec. 1902 were: León, Granada, Managua, Chinandega, Rivas, Masaya, Matagalpa, Carazo, Jinotega, New Segovia, Chontales, and Zelaya—the last including, for the purposes of that decree, the territories of Cape Gracias á Dios and San Juan del Norte. The strip of Caribbean coast now called Zelaya was formerly the Mosquito Reserve, or Mosquitia, a British protectorate; but Great Britain has gradually withdrawn in Nicaragua's favor her claim to exercise jurisdiction there. This eastern coast is now regarded as one of the most valuable parts of the republic; it contains gold mines, its fruit industry is already profitable, large plantations of rubber trees are being cultivated, and rosewood, cedar, and mahogany are taken from its forests.

Physical Geography.—The Sierra de los Morabios, running from the Gulf of Fonseca to the western shore of Lake Managua, appears to be the centre of volcanic energy in Nicaragua. It has the following vents: Cosigüina (famous on account of the terrific explosion of 2 Jan. 1835), Chonco, El Viejo (quiet since 1684), Santa Clara, Telica, San Jacinto, Rota, Las Pilas (eruption in 1850), Asososca, and Momotombo (eruptions in 1870 and 1886); and though only two of these may be described as active, the others are dormant, rather than extinct. This ridge is near the Pacific coast, and its southeasterly trend is continued by the isolated volcanoes Masaya (active), Apoyo (extinct),

NICARAGUA

Mombacho, Ometepe, and Madera (extinct). The two last are on an island near the western shore of Lake Nicaragua, and but a few miles from the nearest point in Costa Rica. In other words, practically the entire Pacific coast range is intensely volcanic; the only exception being found at Brito and the neighborhood southwest and south of Ometepe and Madera, where, according to the views of some geologists, the "internal fissure in the earth's crust that gave rise to the several volcanic vents of Central America" is "completely built up and healed. Hence the low gap in the grand American cordillera found at that place, which has a mean height of about 150 feet above sea-level, the lowest gap from Alaska to Tierra del Fuego." Through this gap, over this "healed fissure," the Nicaragua Canal was to have been cut. The volcanic characteristics are not found far inland, but are restricted almost entirely to the western border; nevertheless the principal cities are built in this narrow strip of land between the Pacific and the lakes. Chinandega, near the summit in the northwest, has 30,000 inhabitants; León, 45,000; Managua, capital of the republic, 30,000; Masaya, 20,000; and Granada, on the west shore of Lake Nicaragua, 25,000. Of these the largest and most beautiful city, León, contains the cathedral of St. Peter which, it is said, was built at a cost of \$5,000,000 when labor was valued at 25 cents a day. From the roof of this great church can be seen in one view 13 volcanoes. In the central region the largest town is Matagalpa (4,000). The western strip, despite its insecurity and oppressive climate, has been preferred as a place of residence by the majority of the Nicaraguans on account of its facilities for communication and transportation—among which are to be reckoned the great lakes, Nicaragua (over 100 miles long) and Managua (about 35 miles), connected by a river which could, without difficulty, be rendered navigable. The greater part of the republic, stretching eastward from the lakes to the department of Zelaya, is of a different geologic formation. It is covered with a chain of mountains of moderate height, and transverse spurs which are not volcanic extrusions but Antillean folds (see CENTRAL AMERICA). Many parts of the central uplands are comparatively cool and well watered, with very rich soil and nearly untouched treasures in forest and mine; but they have remained undeveloped hitherto chiefly on account of the lack of good roads. The earthquake shocks of Nicaragua are less severe than those of Guatemala and Salvador, and dangerous fevers prevail chiefly, though not exclusively, in the lowlands or near stagnant water. The large rivers, rising in the central mountains and emptying into the Caribbean Sea, are the Segovia, also called Coca or Wanks, which forms the boundary with Honduras, the Grande, the Kurringwas, and the Bluefields, near whose mouth is the town of Bluefields (pop. about 2,000). The San Juan flows from Lake Nicaragua to the Caribbean, and in part forms the boundary with Costa Rica on the south. The route of the Caribbean section of the canal, for which the waters of the San Juan would have been utilized, included a cut through Costa Rican territory west of Ochoa.

Mineral Resources.—Among the Central American republics, Nicaragua ranks second (Honduras being first) in respect to mineral

wealth. Gold and silver are found in the departments of New Segovia, Chontales, Zelaya, León, Matagalpa, and Jinotega, copper in León, New Segovia, and Matagalpa, lead and iron in New Segovia and Matagalpa, mercury, salt, sulphate of lime, sulphur, and combustible minerals in León; tin in New Segovia; nickel and zinc in Matagalpa. Up to 1903 only gold mines, or those in which gold was found mixed with silver, were worked. The principal investors were citizens of the United States.

Forests, Agriculture, and Fauna.—The forests produce rubber, mahogany, ebony, cedar, quebracho, light rosewood, mora, brazilwood, vanilla, sarsaparilla, vegetable wax, ipocacuanha, quinquina, copaiba balsam, rhubarb, etc. In many parts of the republic—near both coasts, in the valleys, on the slopes and plateaus near the lakes and rivers—soils of exceptional value for agricultural purposes are found; and though the system of cultivation is rudimentary, extraordinary results are sometimes achieved. Thus, it is said on good authority that sugarcane produces at least two annual crops, and sometimes three; cotton planted in October is picked the following February on all the western lands; the virgin soil of the eastern slope yields four crops of maize in a year; and indigo can be cut three times before replanting becomes necessary. Coffee thrives best at elevations between 2,000 and 3,000 feet above sea-level. Rice produces abundantly on central and eastern slopes. The systematic cultivation of rubber has been undertaken recently. Bananas are grown in the west, principally in the departments of León and Managua, for home consumption; in the east, on a large scale, for export. The annual yield of cacao is insufficient to supply the local demand; in quality, however, it is so excellent that it brings a higher price in the home market than the imported chocolates. Tobacco and aguardiente (made from sugarcane) are government monopolies. A large number of the coffee estates are controlled by Germans. The fauna includes the puma, deer, jaguar, monkeys, alligators, armadillos, ant-eaters, guatuso, peccaries or wild hogs, and many species of reptiles. There are large herds of cattle. Prominent among avifauna are macaws, parrots, buzzards, wild turkeys, and humming-birds.

Commerce.—Exports consist principally of coffee, rubber, bananas, coined silver, coined gold and gold in bars, gold ore and amalgam, hides, sugar, buckskin, and fine woods. Imports are: cotton goods and other tissues, firearms, provisions (dried, salted, or canned), glassware, window-glass, candles, matches, iron and steel in various forms, nails, machetes, crockery and chinaware, furniture, paints, musical instruments, agricultural implements and tools for workshops and domestic use, tanned hides, lamps, wines and liquors, and art objects. Shipments of gold in 1908 amounted to \$933,171. The total foreign commerce for 1909, as shown by the records of the minister of the treasury, was: exports, \$3,600,000, and imports, \$3,500,000. The amount of foreign merchandise imported into Nicaragua during 1902 was less in quantity and value than in any of the previous 10 years, the decline being noticed especially in the amount of British trade. Exports to the United States in the year ending 30 June 1909 were valued at \$1,200,000; imports from the United States for

the same period, \$1,300,000. An analysis of the foreign trade for 1901 shows percentages of exports and imports, as follows: Exports to the United States, 60 per cent, and imports from the United States, 59 per cent; to Germany, 14 per cent, and from Germany, 7 per cent; to Great Britain, 9 per cent, and from Great Britain, 20 per cent; to France, 8 per cent, and from France, 8 per cent.

Shipping, Railways, Roads, etc.—Corinto, the principal western port, has the advantage of the Pacific coast lines of steamships, American, Chilean, British, and German. Bluefields, on the eastern coast, has regular communication with the United States by means of the vessels of New Orleans and Mobile steamship companies. In November 1902 the Central Division of Nicaragua's railway system was practically completed. There is now a continuous line from the port of Corinto to Granada, and several branch lines are projected. The total system in operation is 160 miles long. In 1901 an American syndicate undertook the construction of cart roads to supply communication with Matagalpa, New Segovia, and other points in the interior; a concession was also granted to a citizen of the United States for a line of railway to connect Matagalpa with the head of navigation on the Rio Grande. There are in operation about 3,637 miles of telegraph lines. The number of post-offices was 135 in 1910.

Weights, Measures, and Money.—The metric system of weights and measures is in use. The unit of value is the silver peso, worth \$0.384 in U. S. currency. The note circulation amounted to little more than \$1,000,000 in 1900.

Government.—The presidential term is 4 years; but Gen. Zelaya, who was first elected as a result of the civil war of 1893, retained office continuously, and was in power during the term 1900-6. Constitutionally, the president shares authority with the legislature (a single house, consisting of 40 representatives elected for two years by universal suffrage), and the judiciary (supreme court of justice, two courts of appeals, and inferior tribunals); in practice, however, authorities that should be coordinate may be subordinated by an irresponsible executive (see **DICTATORSHIPS IN LATIN-AMERICA**). The secretaries or ministers are chiefs of the departments of Foreign Affairs and Public Instruction; War and Marine; Treasury; Public Works; and Interior, Justice, and Police.

Finances.—The revenue of the nation from January to September, 1902, amounted to 4,472,375 pesos, and authorized expenditures to 4,803,736 pesos, according to Pres. Zelaya's statement. In 1900 and 1901 public revenues exceeded public expenditure. The main sources of income are customs duties and the tax on liquor and tobacco; the largest expenditures in 1900 were for the ministry of war and marine. The foreign debt is approximately \$1,350,000; in the interior in 1902 the government owed \$12,000,000, "money of the country."

Population, Ethnology, and Education.—The number of inhabitants, formerly given as 560,000, is now estimated at 500,000, including Indians of Mosquitia and uncivilized natives of the interior. A very large proportion are descendants of the aborigines, and there is an admixture of African blood, especially in the east, but the white element is increasing. Though the

population of Nicaragua is so much greater than that of Costa Rica, it has nevertheless a smaller number of schools. Costa Rica has twice as many teachers in her schools as soldiers in her army; Nicaragua, three times as many soldiers in her army as teachers in her schools. Instruction in the higher branches is given at two universities and ten colleges.

History.—(For some of the main events, see **DISCOVERIES, CENTRAL AMERICA, and ISTHMIAN CANALS**). On 21 Jan. 1522 Gil Gonzalez Davila with four vessels sailed westward from Panama in search of the Spice Islands. Proceeding along the Pacific coast, after many mishaps, he reached the home of an Indian chief whose name was Nicaragua, and converted him to Christianity. On the same day 9,017 natives, if we may believe the commander's assertion, accepted baptism. Nicaragua's town stood on the shore of the lake to which his name has been given. Gil Gonzalez heard from the pilots he had with him that, by way of the lake and river, there was easy communication between the "North Sea" and the "South Sea"; and he wrote that only "2 or 3 leagues of very level road" separated the ocean from the lake. Until 1718 the isthmus, including the province of Nicaragua, was subject to the viceroy of Peru; after that to the Spanish representative at Bogotá. New Granada (Colombia) continued to claim certain rights in the entire isthmian territory, even up to Cape Gracias a Dios. The most interesting period is that in which occurred the invasion and temporary conquest of Nicaragua by William Walker, of Nashville, Tenn., with his 56 "emigrants." Walker became virtually dictator in 1856. His aim, disclosed to one of his associates, was to found an empire embracing Central America and Mexico (see **Bibliography**). In 1855 the short-lived "Greater Republic of Central America" was formed by the association of Nicaragua with Salvador and Honduras. It could hardly be called a genuine union.

Bibliography.—American Republics, International Bureau, 'Bulletins' for 1902-1903; Bancroft (H. H.), 'History of Central America'; Belly, 'A travers l'Amerique Centrale'; Chamberlain, 'Volcanoes in Nicaragua' (extract in Bulletin Int. Bureau Am. Reps. Dec. 1902); Doubleday, 'Reminiscences of the "Filibuster" War in Nicaragua'; Squier, 'Nicaragua: its People,' etc., and 'Antiquities of Nicaragua'; Walker (William), 'The War in Nicaragua.'

MARRION WILCOX,
Authority on Latin-America.

Nicaragua, Lake, in the republic of the same name, is situated in the southwest of Nicaragua, 110 feet above the Pacific Ocean, from which it is separated by a strip of land 12 miles wide. It is over 100 miles long from northwest to southeast, has a mean breadth of 30 miles and a maximum of 40 miles, and ranges from 50 feet to 200 feet deep. It receives the waters of Lake Managua to the northwest by the Tipitapa River, and discharges by the San Juan River into the Caribbean Sea. There are numerous islands in the lake, the largest being Ometepe, noted for its two active volcanoes. There is steamer traffic, the lake forming a link in the route across the isthmus of Central America. See **CANALS and NICARAGUA** for the

NICARAGUA WOOD—NICENE CREED

projected interoceanic waterway via Lake Nicaragua.

Nicaragua Wood, a bright-red dye-wood native to Nicaragua, and a species of *Casahuate*. It resembles Brazil wood botanically and in its properties, but yields a smaller amount of coloring matter.

Nica'tor. See **DEMETERIUS II**.

Niccolini, Giovanni Battista, jō-vān'nē bāt-tēs'tā nēk-kō-lē'nē, Italian dramatist: b. San Giuliano, near Pisa, 31 Oct. 1782; d. Florence 20 Sept. 1861. He studied at the University of Pisa; published his first poem in 1804; and became in 1807 professor of history and mythology in the Academy of Fine Arts in Florence. His chief writings are his patriotic tragedies and his lyric verse. Among the former are: 'Nabucco' (1819); 'Antonio Foscari' (1827); 'Giovanni da Bocca' (1830), and 'Arnoldo da Brescia' (1843), the last a bitter attack on the Guelph party. Niccolini wrote also some volumes of criticism. The best collected edition is by Gaigelli (1862 et seq.). Consult the biography and critique by Vanucci (1866).

Nic'colite, a native arsenide of nickel, having the chemical formula $NiAs$. The crystals, when found, belong to the hexagonal system; but the mineral usually occurs massive. It is reddish in color, and opaque with a metallic lustre. It has a hardness of from 5 to 5.5, and a specific gravity of from 7.3 to 7.7. Niccolite occurs in Saxony, Sweden, Cornwall, Scotland, Chile, and the Argentine Republic. In North America it is found at Chatham, Conn., at Franklin Furnace, N. J., at Silver Cliff, Colo., and at Tilt Cove, Newfoundland. (Also known as "Kupfernickel," "false copper," or "devil's copper.")

Nic'colla, Samuel Jack, American Presbyterian clergyman: b. Greenfield Farm, Westmoreland County, Pa., 3 Aug. 1838. He was graduated from Jefferson College in 1857; studied theology at Western Theological Seminary, and was ordained to the Presbyterian ministry in 1860. He was subsequently pastor at Chambersburg, Pa., and chaplain of the 126th Pennsylvania volunteers in 1862, and in 1863 became pastor of the 2d Presbyterian Church, St. Louis. He was moderator of the Presbyterian General Assembly in 1872, and has published 'Women's Position in the Church,' 'The Eastern Question in Prophecy.'

Niccolo (nēk'kō-lō) of Arezzo, ñ-rēt'sō, Italian painter: b. Arezzo 1350; d. 1417. He worked on the sculpture of the cathedral at Florence, and executed two statues for the campanile (1383). His relief of the Virgin in the façade of the Santa Maria della Misericordia is remarkable for a freedom and elegance which point to a distinct advance in Italian sculpture.

Niccolò de' Niccoli, dā nēk'kō-lē, Italian humanist: b. Florence 1363; d. there 23 June 1437. He rendered literature most important service by ransacking Europe for manuscripts of the principal Greek and Latin works. At his death he presented to the public his library, which became the basis of the Marcian library, one of the most famous of Italy. Niccolò copied and corrected numerous MSS. with his own

hand, and thus came to be regarded as the originator of textual criticism of the ancient authors.

Nice, nī'kē, a Greek goddess. See **NIXE**.

Nica, nā, Asia Minor. See **NICAEA**.

Nice, France, a city, seaport, and health resort, capital of the department of the Alpes Maritimes, beautifully situated near the base of the Maritime Alps, on the Mediterranean, and on both sides of the Paillon or Paglione, a mountain torrent of short and rapid course, 140 miles east by north of Marseilles. It is divided into the Old Town, on the left bank of the Paglione, and the New Town, on the right. Both quarters, but more especially the New Town, have of late years been much extended. The streets of the former are mean-looking compared with those of the latter, in which there are wide streets and boulevards, and lofty and handsome houses. The quays that border the Paglione are lined with gay shops, and between these and the sea the stream is entirely covered over, leaving a wide space or square where is a handsome public casino, with a fine winter-garden, and another square adorned by a statue of Masséna in bronze. At the mouth of the stream there is a public garden, and westward along the sea-front a fine promenade bordered with handsome hotels and villas. On a pier or jetty projecting from the public garden is a fine new casino. There are no remarkable public buildings in the city. There are places of worship for English, Scotch, Germans, Russians, and Americans, natural history museum, observatory, several theatres, public library, etc. Nice possesses some silk, cotton, and paper mills; many oil-mills, and manufactories of leather, soap, liqueurs, essences, perfumery, etc. Immense quantities of flowers are grown. The harbor or port is separated from the rest of the town by the Castle Hill (320 feet), which has been laid out into beautiful grounds commanding magnificent views and crowned by the remains of an old castle. The harbor has recently been greatly improved, but it is not deep enough for the largest class of steamers. The exports by sea consist principally of olive-oil. Nice is much resorted to in winter by foreigners, particularly English. Owing to sudden changes of temperature, its climate is unsuitable for those laboring under pulmonary and bronchial complaints. Pop. about 130,000. The ancient Ligurian town of Nicaea, founded by a colony of Phocians from Massala (Marseilles), became subject to Rome in the 2d century B.C. It was in the hands of the Saracens during the greater part of the 10th century. Then, after existing as an independent city, it acknowledged the supremacy of the Counts of Provence and the House of Savoy (1388). In 1543 it was taken and pillaged by the Turks. Later, from 1600 onward, it was repeatedly taken by the French; and they kept possession of it from 1792 to 1814. In 1860 it was ceded to France by Sardinia (Savoy). Masséna was born near the city, and Garibaldi in it. Consult: Moris, 'Nice' (1899); Nash, 'Guide to Nice' (1884).

Nice, Councils of. See **NICAEA, COUNCILS OF**.

Nicene (nī'sēn) Creed, a somewhat detailed statement of Christian doctrine used

NICEPHORUS—NICHOLAS

in their liturgies by the Roman Catholic, Oriental and Anglican Churches. The first part was formulated at the Council of Nice (q.v.). The final clauses after "And I believe in the Holy Ghost" were added at the Council of Constantinople 381. See *Creeds*; *Philology*; *Antiquities*.

Nicephorus, ní-sē'fō-rūs, Greek historian: b. 758; d. 829. He is generally known as Nicephorus Constantinopolitanus, was secretary to the Empress Irene, and in 806 was elected patriarch of Constantinople. The violent emperor Leo V. deposed him, and he retired to a cloister in 805. To this retirement we owe his invaluable "Chronologia Compendiaria" and "Breviarium Historicum."

Nicephorus I., Byzantine emperor of the first decade of the 9th century A.D.; d. 26 July 811. He is often called "Logothetes," this being his title as financial secretary to Irene, whom he succeeded on the throne October 802, thanks to a sudden revolution. His experience in finance led him to lay heavy taxes, and he sided with the iconoclastic party. These two courses won him unpopularity, which was increased by his unsuccessful foreign administration; in 803 he gave up nearly all Italy to Charlemagne; in 806 was forced to sign a humiliating peace with the Arabs; and in 811 was defeated and killed by the Bulgarians under Khan Krum.

Nicephorus II., Phocas, Byzantine emperor: b. 912; d. 10 Dec. 969. He was of Capadocian descent, and, like his father, Bardas Phocas, proved himself a great general. During the reigns of Constantine VII. and Romanus II. he fought the Arabs in Asia and southern Italy, and in 961 recaptured the island of Crete from the Saracens. In 963 he returned to Constantinople after the death of Romanus II., was proclaimed emperor 16 August, and 20 September married Romanus' widow, Theophano. As emperor Nicephorus' military career was no less brilliant than before; he renewed the war against the Arabs, won all of Cilicia, and in 969 captured Antioch; and was equally successful against the Bulgarians and Macedonians. At home his heavy taxes to carry on these campaigns and his bold tampering with ecclesiastical funds aroused monks and people against him. He was assassinated by his wife's paramour and his own kinsman and general, John Tzimiskes. Nicephorus was not only a general but a statesman and diplomat; witness his work "Legatio," edited by Pertz (1839). Consult Schlumberger, "Nicephore Phocas" (1890).

Nicephorus III., Botaniates, Byzantine emperor of the 11th century. He was a general, who had grown old in the service, when in 1078 he successfully plotted against Michael VII. and became emperor. His reign of three years was filled with contention against his rivals at home and with Robert Guiscard abroad. He was forced to abdicate in favor of Alexis Comnenus in April 1081, and spent the rest of his life in a monastery.

Nicetas Acominatus, ní-sē'tas á-kóm-i-ná'tūs, Byzantine historian: b. Chonae (hence called Choniates) in the middle of the 12th century; d. Nicæa 1216. He was a resident and official of Constantinople up to 1204, when the city was captured and he removed to Nicæa. His excellent history of the Byzantine Empire

from 1118 to 1206, completing Zonaras, is his most important work; it is edited by Bekker (1835).

Nichiren, ních'i-rén, Japanese religious reformer: b. 1222 A.D.; d. 1282. He founded a Buddhist sect, the Nichiren-shū. He appears to have been a fanatic religionist, and to have quarreled bitterly with other sects. Two exiles were imposed upon him for his disturbances. The central doctrine of his teaching is that all life may attain to being a Buddha by repeated transmigration. Final salvation is reached by prayer and obedience to the law. Nichiren is revered, but not worshipped, by his followers, whose chief shrines are at Ikegami, near Tokyo.

Nichol, ník'ól, John, Scottish lecturer and author: b. Montrose, Forfarshire, Scotland, 11 Sept. 1833; d. London 11 Oct. 1894. He was educated at Glasgow University and Balliol College, Oxford, being graduated with honor from the latter in 1859. From 1862 to 1889 he was professor of English literature in Glasgow University, and later lectured widely in England and Scotland on literary subjects. He visited the United States several times, and during the Civil War warmly supported the Northern cause. He prepared the article on "American Literature" for the "Encyclopædia Britannica," which has been separately published; and also wrote "Fragments of Criticism" (1860); "Hannibal" (1872), a dramatic poem; "Tables of European Literature and History" (1876); "Byron" in the "English Men of Letters" series (1880); "Robert Burns" (1882); "Francis Bacon, his Life and Philosophy" in "Philosophic Classics for English Readers" (1888-9); "Kant" (1889); and "Carlyle" in the "English Men of Letters" series (1892). Consult his "Memoir" by Knight (1896).

Nichol, John Pringle, Scottish astronomer: b. Brechin, Forfarshire, 13 Jan. 1804; d. near Rothesay 19 Sept. 1899. Originally educated for the Scottish Church, he turned his attention to astronomy, and in 1836 was appointed professor of astronomy in Glasgow University, a post which he retained with great credit till his death. Among his works may be mentioned "The Architecture of the Heavens" (1838); "Contemplations on the Solar System" (1838); "The Planet Neptune, an Exposition and History" (1848); "The Stellar Universe" (1848); and the "Planetary System" (1851). These have the merit of being written in a very attractive and interesting style, and obtained a wide popularity. He likewise edited a "Cyclopædia of Physical Sciences" (1857).

Nicholas, ník'ól-las, a proselyte of Antioch, one of the seven deacons (Acts vi. 5). He is sometimes charged, though on insufficient evidence, with founding the sect of Nicolaitans alluded to in Rev. ii. 13.

Nicholas, Saint, of Myra, one of the chief saints of the Greek Church, called the "Wonder-Worker" and venerated by the Roman Catholic Church: b. Patara, province of Lycia, toward the end of the 3d century; d. Myra 6 Dec. 342. He was a bishop of Myra, imprisoned during the Diocletian persecution, and set at liberty by Constantine the Great. He is venerated in the East and West as a saint and miracle worker, the patron of little children, unwedded

midens and sailors. In 1087 his body was translated and arrived in his native city of Patara amid great rejoicing, 9 May. His festival, the anniversary day of his death, is still kept with special ceremonies in Germany, Switzerland and the Low Countries. He is the original of the Christmas present-bringer, "Santa Claus." Consult: Praxmarer, 'Der Heilige Nikolaus und seine Verehrung' (1894).

Nicholas, the name of five popes, as follows

Nicholas I., Saint: b. Rome; d. there 867. He succeeded Benedict III., in 858. He was of a resolute disposition and successfully upheld the papal authority. He excommunicated Photius, patriarch of Constantinople who had usurped that see after the deposition of Ignatius by the emperor Michael III. Consult: Lämmer, 'Papst Nikolaus I. und die byzantinische Staatskirche seiner Zeit' (1857); Leroy, 'Saint Nicholas I.' (1898); Ray, 'Nicholas I.' (1901).

Nicholas II. (GERHARD, gerhárt, Fr. zhârâr): b. Burgundy; d. Florence 19 July 1061. A canon of Liège he became bishop of Florence in 1046 and succeeded Stephen X. in the papal chair in 1059. He was opposed by a rival, called Benedict X., the choice of some of the Roman nobles, but being disavowed by the council of Satri, Benedict was obliged to forego his claim. Hildebrand was the counsellor of Nicholas throughout his pontificate, and through his direction a council was assembled at Rome in 1059 which restricted the papal election to the college of cardinals.

Nicholas III. (GIOVANNI GAETANO DEGLI ORSINI, jô-vân'nê gã-â-tâ'nô dâ'glê ôr sê'nê): d. 1280. He came of a noble Italian family and in 1277 was elected in succession to John XXI. From the emperor, Rudolph of Hapsburg, he succeeded in obtaining the cession of Romagna and the exarchate of Ravenna and he deprived Charles d'Anjou, king of Naples, of the vicariate of Tuscany. He was succeeded by Martin IV.

Nicholas IV. (GEMONIMO, jâ-rô-nê'mô): b. Ascoli, Italy; d. 1292. While very young he entered the order of Saint Francis and in 1274 became its general. He was made a cardinal by Nicholas III., and bishop of Palestrina by Martin IV. and in 1288 was elected pope. He was the first Franciscan pontiff. He excommunicated James of Aragon and his followers in Sicily and promoted the claims of Charles II. of Anjou to that kingdom. His unsuccessful efforts to excite a new crusade are supposed to have hastened his death.

Nicholas V. (TOMMASO PARENTUCELLI, tômmâ'sô pâ-rên-too-chê'lê): b. probably at Sarzana, near Pisa, 1397; d. 1455. He was the cardinal-bishop of Bologna and succeeded Eugenius IV. in 1447. He was one of the most learned men of his time, collected books and manuscripts, and ordered translations to be made of the Greek classics. The Vatican library was also founded by him, and he embellished Rome with numerous fine edifices. In 1458 the name of Nicholas V. was assumed by Peter de Corbario, a Franciscan whom Louis of Bavaria set up as antipope against John XXII. This ecclesiastic, however, soon made his submission, and died in 1333.

Nicholas I. Pavlovitch, czar of Russia: b. near St. Petersburg 6 July (25 June) 1796; d. St.

Petersburg 2 March 1855. He was third son of Paul I. The crown was relinquished by his elder brother, Constantine, and on 24 Dec. 1825 he entered upon his reign and 3 Sept. 1826 was crowned at Moscow. On 26 Dec. 1825 the military conspiracy of the Decabrists, which had been for several years in operation, broke out. Nicholas suppressed this revolt with great energy and personal courage; but the ultimate result was to arouse a policy of strong autocracy, based largely on the army, and bent on strictly maintaining internal peace. The civil administration was placed under military supervision; and the laws subsequently promulgated for the relief of serfdom were largely ineffective. Nicholas' foreign policy was aggressive. A war with Persia (1827-8) was concluded by a peace which gave Russia an important increase in territory; and one with Turkey (1828-9) by the peace of Adrianople which secured to Russia the eastern coast of the Black Sea, and brought about the establishment of the Grecian kingdom. In 1849 Nicholas aided Austria in the conquest of the Hungarian revolutionists. His attitude toward Turkey brought on the unfortunate Crimean war. In 1853 he demanded the protectorate over Turkish subjects of Greek religion, but the Sultan refused, and was supported by England and France. The Russian army proved to be unprepared, and was defeated at the Alma and Inkerman. Nicholas died before the end of the contest (see CRIMEAN WAR). During his reign conformity to the Orthodox Greek Church was imposed. He was probably the most prominent sovereign of his time and in many ways a rather majestic despot. Consult: Smucker, 'Nicholas I.' (1860); Lacroix, 'Histoire de la Vie et du Règne de Nicholas I.' (1864-75); Edwards, 'The Romanoffs' (1890).

Nicholas II, czar of Russia: b. St. Petersburg 18 May 1868. He was the eldest son of Alexander III. by his wife, the Danish princess Dagmar, known as czarina by the name Maria Feodorovna. His education under General Danilovitch was military; it was concluded by a trip through the East, in 1891, during which he was nearly killed by a sabre stroke from a Japanese fanatic. His father's death 1 Nov. 1894 brought him (much against his will) to the throne; he married Princess Alice of Hesse 26 Nov. 1894; and in May 1896 was crowned with great pomp at St. Petersburg. His policy he proclaimed would be the peaceful one of his father, and this is certainly proved true as regards his relations with the European powers. His visits to Vienna, Breslau, and Paris in 1896, and the visits paid him in return in 1897 by the Emperor of Austria, by William II. of Germany, and by President Faure of France have shown his willingness and the eagerness of Austria, Germany, and France that there be a peaceful European policy. Even more striking was the Czar's note to the powers, published by Count Muravieff 24 Aug. 1898, inviting them to a Peace Congress, looking to the disarmament of the Powers. The Hague Congress in 1899 was followed by another visit to Paris by the Czar 18-21 Sept. 1901 and by President Loubet's trip to St. Petersburg 20-23 May 1902, and by a Franco-Russian convention intended to offset the Anglo-Japanese entente.

Upon his accession, Nicholas II. was hailed as a liberal, if not a radical. Whether there has

been internal reform during his administration is uncertain; even the rescript in favor of religious freedom seems a doubtful reform in the eyes of some critics, who urged that although freedom is granted to all present sects the death penalty still holds for any Greek churchman who leaves the Orthodox faith for any other. How far the Emperor is personally responsible for the acts of his government is also doubtful; he is often described as the mere tool of his narrow procurator-general, Pobiedonostyeff, and sometimes as a prey to morbid melancholia and the dupe of spiritualists and quacks. The measures taken to Russianize Finland, and the slack treatment of those guilty of the Kishineff massacres, seem—to say the least—unlike the Czar as he was pictured at his accession. Consult: Ukhtomsky's description of the trip through the Orient (English 1896-1900), Notovitch, 'L'Empereur Nicolas II. et la Politique Russe' (1895), and Leudet, 'Nicolas II. intime' (1899).

Nicholas I. Petrovitch Njegosch, prince of Montenegro: b. 7 Oct. 1841. He succeeded his uncle, Prince Danilo, 14 Aug. 1860. In 1862 he undertook a war against Turkey which ended in an unfavorable peace 13 September; but most of the more burdensome conditions were removed by the Powers, and his partial independence was recognized. In 1876-8 with the aid of Russia, which supplied to him provisions, money, and munitions, he waged a second and successful war against Turkey; and at the Berlin Congress he obtained a large increase in the area of his dominion and the recognition of his independent sovereignty. He gave the state a sort of constitution. He wrote several dramas and other verse.

Nicholas, Sir Edward, English secretary of state: b. Wiltshire, England, 4 April 1593; d. East Horsley, Surrey, England, 1 Sept. 1669. He was graduated from Queen's College, Oxford, in 1611, and in 1627-8 he was a member of Parliament. In 1641 he became secretary of state under Charles I. and nominally remained in that office until the king's execution. Upon the restoration of Charles II. in 1660 he resumed his former office, from which age compelled his resignation in 1662.

Nicholas, Wilson Cary, American soldier and legislator: b. Hanover, Va., about 1757; d. Milton, Va., 10 Oct. 1820. In 1774 he was graduated from William and Mary College, and at the beginning of the Revolutionary War joined the Continental army. He became officer in command of Washington's life guards and served in this position till 1783. He was a member of the Virginia State Convention which ratified the Constitution of the United States, and was one of those who favored ratification. In 1799 he became United States Senator, and in 1804 resigned from the Senate to become collector of the ports of Norfolk and Portsmouth. In 1807 he was elected to Congress, serving till 1814, and in the latter year was elected governor of Virginia for two years. He was one of the most influential supporters of Thomas Jefferson.

Nicholas of Clémanges. See CLÉMANGES, MATHEU NICOLAS.

Nicholas of Cusa. See CUSA.

Nicholas of Lyra, 11th c., called "Doctor Planus et Utilis," mediaeval French monk and Biblical scholar: b. Lyre, Normandy; d. Paris

23 Oct. 1340. He entered the Franciscan order in 1291, became an instructor in theology; and later provincial of his order in Burgundy. His Hebrew and rabbinical learning was profound. His chief work is the 'Postillæ Perpetuæ' (1471-2), a running commentary on the Scriptures, which, on account of his linguistic knowledge, is on a much sounder basis than similar works of the period. It was much used by Luther; but can hardly be justly credited with the influence once ascribed to it in the time:

"Si Lyra non lyrasset,
Lutherus non saltasset."

(If Lyra had not played, Luther would not have danced).

Nicholas Nickleby, nîk'î-bî, a well known novel by Charles Dickens which appeared serially in 1838 and 1839. It contains in Dotheboys Hall a realistic description of the condition of cheap boarding schools of that period, and the author's strictures accomplished not a little toward reform in this direction.

Nicholasville, nîk'ô-las-vîl, Ky., city, county-seat of Jessamine County; on the Cincinnati, N. O. & T. P., the Louisville & N., and the Louisville & A. R.R.'s; about 10 miles south by west of Lexington and 70 miles east by south of Louisville. It was settled in 1799 and in 1835 was incorporated. It is the commercial centre of a productive agricultural region, in which tobacco is one of the chief crops, and considerable attention is given to horse-breeding. It has flour and lumber mills, tobacco storage plants, and wheel works. The Jessamine Female Institute, opened in 1854, is located here. Pop. 2,600.

Nicholls, nîk'ôlz, Charlotte. See BRONTË, CHARLOTTE.

Nicholls, Francis Tillon, American lawyer: b. Donaldsonville, Ascension Parish, La., 20 Aug. 1834; d. Jan. 1912. He was graduated from West Point in 1855, and in 1856 served in the campaign against the Seminole Indians. He then resigned his commission in the army to study law, and was admitted to the bar in 1858, beginning his practice in Napoleonville. In 1861 he entered the Confederate army as captain, and was promoted lieutenant-colonel in the same year, and brigadier-general in 1862. He had charge of the defenses of Lynchburg, Va., and in 1864 was superintendent of the trans-Mississippi conscript bureau. After the war he resumed his law practice in Ascension Parish, La., and later removed to New Orleans (1880). In 1876 he was the Democratic candidate for governor, his party claimed the election by about 8,000 votes, but a Republican returning board declared his opponent elected. He, however, took his seat, and was subsequently recognized as governor by the Federal government. In 1888 he was again elected governor, and during his administration actively opposed the Louisiana Lottery Company, and vetoed the bill granting it a new charter with increased privileges. In 1893 he became chief justice of the Louisiana State supreme court.

Nichols, Edward Tatnall, American naval officer: b. Augusta, Ga., 1 March 1823; d. Pomfret, Conn., 12 Oct. 1886. He studied at the United States Naval Academy, became commander in 1862, in the Civil War commanded the Winona of the West Gulf squadron, and re-

NICHOLS—NICHOLSON

ceived the surrender of Fort St. Philip 28 April 1862. In the passage of the Vicksburg batteries, also, he distinguished himself. In 1876 he reached the grade of rear-admiral, and in 1885 was retired.

Nichols, George Ward, American writer: b. Mount Desert, Maine, 21 June 1837; d. Cincinnati, Ohio, 15 Sept. 1885. He was art critic on the *New York Evening Post* under William Cullen Bryant, and was aide-de-camp to General Sherman in the Civil War. He was president of the Cincinnati College of Music for several years and greatly improved its educational and financial standing. He wrote: 'The Story of a Great March' (1865); 'Art Education Applied to Industry' (1877); 'Pottery' (1878); etc.

Nichols, Henry Ezra, American naval officer: b. New York; d. off Paranaque, Philippine Islands, 10 June 1899. He was graduated from the United States Naval Academy in 1865 and served in the navy with steady promotion. He was engaged on the Coast Survey in 1876-7 and in 1880-4, and in 1897 took command of the Bennington, which became one of Admiral Dewey's fleet in 1898. In 1899 he was transferred to the command of the monitor Monadnock and rendered valuable assistance at the capture of Paranaque. Captain Nichols was overcome by the heat during the bombardment and died while his ship was still in action.

Nichols, William Ford, American Protestant Episcopal bishop: b. Lloyd, N. Y., 9 June 1849. He was graduated from Trinity College, Hartford, Conn., in 1870, and from the Berkeley Divinity School, Middletown, Conn., in 1873. He entered the priesthood the next year and was successively rector of churches at West Hartford, Conn.; Newton, Conn.; Christ Church, Hartford (1877-87); and St. James, Philadelphia (1887-90). He declined the bishop-coadjutorship of Ohio in 1888, but in 1890 was consecrated bishop-coadjutor of California, becoming bishop of that diocese in 1893.

Nicholson, nk'ól-són, Sir Francis, English colonial governor: b. England 1660; d. London 5 March 1728. In 1684 he came to America as lieutenant in the English army and in 1688 was commissioned lieutenant-governor of New England and represented the governor, Sir Edmund Andros (q.v.) at New York. At the time of the accession of William and Mary in England and of the Leisler rebellion in New York, he was obliged to abdicate his office and return to England. (See LEISLER, JACOB.) In 1690 he was appointed lieutenant-governor of Virginia, and went to Jamestown to take charge of the affairs of the colony. During his administration, which was most successful, he gave especial attention to bettering the condition of the established church and to education; he was one of the founders of William and Mary College, to which he gave £300. When Andros succeeded Lord Howard as governor of Virginia, Nicholson, disappointed that he had not received the appointment, resigned as lieutenant-governor, and was made governor of Maryland. Here he aroused opposition by changing the capital from St. Mary's to Annapolis, and also by his intolerant attitude toward the Catholics and others not connected with the Church of England. In 1698 he was appointed governor of Virginia, but

failed to attain his former success in that colony. His constant menacing and tyrannical attitude aroused the opposition of the Virginians, and he particularly angered them by his removal of the capital from Jamestown to Williamsburg; he was recalled from Virginia in 1705. In 1710 he commanded an expedition against Canada and captured Port Royal, and in 1713 was made governor of Acadia. In 1719 he received his appointment as governor of South Carolina, being the first royal governor of that colony, and filled the office with ability and success. He returned to England in 1725, when he was promoted lieutenant-general. He wrote 'Journal of an Expedition for the Reduction of Port Royal' (1711); and 'An Apology or Vindication of Sir Francis Nicholson, Governor of South Carolina' (1724).

Nicholson, Henry Alleyne, English scientist: b. Penrith, Cumberland, 11 Sept. 1844; d. Aberdeen, Scotland, 19 Jan. 1899. He was educated at Göttingen and Edinburgh, was professor of natural history in the University of Toronto in 1871-4, of physical science in the Durham College of Physical Science in 1874-5, and of natural history at St. Andrews in 1875-82. From 1882 to 1899 he was regius professor of natural history at Aberdeen. He was elected F. R. S. in 1897. His chief work was done in the paleontological department of zoology. Among his writings are 'A Manual of Paleontology' (1872; 3d ed. with Lydekker 1889), 'Introduction to the Study of Biology' (1872), and many scientific papers.

Nicholson, Isaac Lea, American Protestant Episcopal bishop: b. Baltimore, Md., 18 Jan. 1844; d. Milwaukee, Wis., 29 Oct. 1906. He was graduated from Dartmouth in 1869, took priest's orders in the Episcopal Church in 1872, and held rectorships at Baltimore 1872-5; Westminster, Md., 1875-9; and St. Mark's, Philadelphia, 1879-91. In 1891 he was consecrated bishop of Milwaukee.

Nicholson, James, American sailor: b. Chestertown, Md., 1737; d. New York city 2 Sept. 1804. He went to sea when a boy, and was engaged in the capture of Havana in 1762. In 1776 he was given command of the *Defence*, fitted out by the colony of Maryland, and retook some vessels which the British had captured. In June 1776 he was assigned to the command of the *Virginia* of the Continental navy, and while his vessel was blockaded in Chesapeake Bay he with his crew joined the army and took part in the battle of Trenton. Later when the *Virginia* attempted to put to sea she went aground and was taken by the British, though Captain Nicholson and most of his crew escaped; an official inquiry acquitted him of all blame. In January 1777 he was made commander-in-chief of the Continental navy, holding that position till the close of the war. In June 1780, when in command of the frigate *Trumbull*, he fought a severe battle with the British ship *Wyoming*, without decisive result; and in August 1781 was taken prisoner in the *Trumbull* by the British vessels *Iris* and *General Monk*, though he made a most gallant resistance and did not surrender until his ship was completely disabled. He was exchanged shortly before the close of the war, and in 1801 was appointed commissioner of loans for the State of New York.

NICHOLSON—NICK OF THE WOODS

Nicholson, James William Augustus, American sailor: b. Dedham, Mass., 10 March 1821; d. New York 28 Oct. 1887. He entered the navy as a midshipman in 1838, served in the Mexican War, and as lieutenant under Perry on the Japan expedition. In the Civil War he commanded the steamer Isaac Smith in the operations against Port Royal (1861); in 1862 was promoted to the rank of commander, and had charge of the monitor Manhattan in the battle of Mobile Bay; and later took part in the bombardment of Fort Morgan. In 1873 he was promoted commodore, and from 1876 to 1880 was in command of the Brooklyn Navy Yard. In 1881 he was made rear-admiral and was assigned to the Mediterranean, where he protected the United States consulate during the English bombardment of Alexandria, Egypt, and had much influence in restoring order. In 1883 he was retired from active service.

Nicholson, John, British officer in India: b. Dublin 11 Dec. 1821; d. near Delhi 23 Sept. 1857. He went to India in 1839 in the employ of the East India Company; showed great bravery in the defense of Ghazni in 1841 and during the treacherous attack made by the Afghans immediately afterward; served in the commissary during the first Sikh war, and actively in the second Sikh war; and was very successful as deputy commissioner of Lahore, doing especially good service during the Mutiny. He was mortally wounded in the assault on Delhi and died nine days afterward.

Nicholson, Joseph Shield, English political economist: b. Wragby, Lincolnshire, 9 Nov. 1850. He was educated at the University of Edinburgh, at Trinity College, Cambridge, and at Heidelberg; and in 1880 became professor of political economy at Edinburgh. Among his writings on his specialty are: 'Effects of Machinery on Wages' (1878); 'The Silver Question' (1886); 'Principles of Political Economy' (1893-1901); 'Strikes and Social Problems' (1896). He wrote also some fiction, including 'Thoth' (1888); 'Toxar' (1890); and edited (1884) Adam Smith's 'Wealth of Nations.'

Nicholson, Louisa Margaret (LOUISA NIXON), American singer: b. Philadelphia, Pa., 1872. She was educated abroad, where she made her debut in 1889 with marked success, and became prima donna at the Paris Opera in 1894. The roles in which she has achieved most success are: 'Fille du régiment'; 'Traviata'; 'Pagliacci'; etc.

Nicholson, Meredith, American author: b. Crawfordsville, Ind., 9 Dec. 1866. He entered journalism and in 1885-97 was reporter and editor on the Indianapolis News. In 1897-1901 he was treasurer of a coal-mining company in Denver and then returned to Indianapolis, where he has since devoted himself to literature. He has written: 'Short Flights,' verse (1894); 'The Main Chance' (1903); 'The Hoosiers' (1900); etc.

Nicholson, Reynold Alleyne, English Orientalist: b. 19 Aug. 1868. He was a son of H. A. Nicholson (q.v.). He was educated at the University of Aberdeen and at Trinity College, Cambridge, continuing his studies in Germany. He was examiner in classics at Aberdeen in 1897 and since 1901 has been professor of Persian in University College, London, and lec-

turer in Persian at the University of Cambridge. He has published: 'Selected Poems from the Divani Shamsi Tabriz' (1898).

Nicholson, William, English artist: b. Newark-upon-Trent 1872. He began his artistic education under Herkomer in London and completed it under Bonheure and Constant in Paris. He collaborated with James Pryde in the designing of posters, whose brilliant originality at once attracted attention and established his reputation as a great wood engraver. Among his productions the most notable are: 'An Alphabet' (1898); 'An Almanac of Twelve Sports' (1898); 'London Types' (1898); and 'Characters of Romance.' His portrait woodcuts have met with wide recognition, especially his 'Whistler'; 'Kipling'; 'Bernhardt'; 'Queen Victoria.'

Nicias, Nish'tas, Greek painter of the 4th century B.C. He was renowned for the loveliness of his woman figures in encaustic (q.v.). He was a contemporary to Apelles, the painter of Alexander the Great, and Praxiteles the sculptor, whom he assisted in coloring his statues. He is said to have invented encaustic painting.

Nicias, Athenian general in the Peloponnesian war (q.v.): d. Sicily 423 B.C. He inherited great wealth from his father, Niceratus, and, entering politics after Pericles' death, became leader of the aristocratic party and the enemy of all demagogues, notably Cleon. He won popular favor, however, by his lavish use of his wealth. His natural caution and timidity was a proverb among the comic poets of the day, and he seems to have been the prey of blackmailers. In 425 he led the troops that hemmed the Spartans in at Sphacteria; in the next year captured Cythera; in 423 was in command in Thrace; and, after Cleon's death, brought about the famous Peace of Nicias (421). Cleon's place as a leader of the war party was to a certain degree taken by Alcibiades, who won consent to his plan for the Sicilian expedition largely by his clever suggestion that Nicias, the opponent of the project, the tried general, and the well-known conservative, should be one of the commanders of the expedition. The recall of Alcibiades soon after the expedition started left matters largely in Nicias' hands. After the death of his colleague Lamachus this was less true, since the new general Demosthenes boldly urged open attack on Syracuse. Nicias saw that this would be fatal, and influenced by superstitious fear of an eclipse of the moon refused to act at all for a month. He was terribly defeated, weakly surrendered; and in spite of the promises of his enemies was put to death. He had been mortally sick throughout this trying campaign. Consult Church, 'Nicias and the Sicilian Expedition' (1899).

Nick of the Woods, a romance by Robert Montgomery Bird, M.D., published in 1837. It is a tale of Kentucky during the "dark and bloody" days, and was very popular about the middle of the 19th century. A play, founded upon this narrative, was received with boundless applause, held the stage (a certain grade of stage) for many years, and was a forerunner of the "dime novel" in stimulating a desire among boys to run away from home and go West to kill Indians. The author was taken to task by some critics who complained that he pictures the red man upon a plane far below that of the noble

NICKEL—NICKEL-STEEL

savage described by Cooper and others. Bird replied that he described the cruel, treacherous, and vindictive Indian as he existed, and not the ideal creation of a novelist.

Nickel, a metallic element resembling iron in its appearance and general properties, discovered by Cronstedt in 1751 in kupfernickel (see NICCOLITE), a mineral which resembles copper ore, but from which copper cannot be extracted, and whose name appears to signify "devil's copper." Metallic nickel occurs in the form of grains along the bed of the Fraser river, and it is also a common constituent of meteorites. The commercial supply, however, is obtained by the reduction of certain nickel-bearing minerals, of which niccolite and garnierite are the most important. The latter mineral is especially valuable because it is free from cobalt, a metal with which nickel is almost always associated, and from which it can be separated only with much difficulty. Garnierite is a hydrated silicate of nickel and magnesium, of variable composition, which occurs in vast quantities in the vicinity of Noumea, New Caledonia; similar deposits also exist in Douglas County, Oregon, and Jackson County, North Carolina, and also in the province of Malaga, Spain. The New Caledonia mines are worked by a French company, which ships the nickel to Europe both as matte and as ore.

Physically, nickel is a hard, ductile, malleable metal, white in color, but with a yellowish tinge, and susceptible of a fine polish. Its specific gravity varies from 8.36 to 9.26, according to the physical treatment to which the metal has been subjected; its specific heat is about 0.109, and its specific electrical resistance is about one seventh of that of mercury. It melts at a high temperature,—probably at about 2,500° F. Next to iron and cobalt, nickel is the most magnetic substance known, the magnet attracting it very strongly, though less strongly than either of the other two metals mentioned. (For full data concerning the magnetic qualities of nickel, consult Ewing, 'Magnetic Induction in Iron and Other Metals'.) Nickel is greatly used for electroplating, both for protection against rusting, and on account of the lustrous polish that can easily be given to articles coated with it. It is also largely coming into favor for the manufacture of cooking utensils. When alloyed with other metals, nickel is used for coinage, and for other purposes past enumeration. With iron it forms alloys that are collectively known as "nickel-steel," certain of these being of the highest value for the manufacture of armor plate. The nickel-iron alloys are anomalous in many respects. It has been found, for example, that although nickel and iron are two of the most highly magnetic elements known, it is possible to form alloys of these two metals alone, which are practically non-magnetic. Iron-nickel alloys are also anomalous with respect to their coefficients of expansion, and one of them in particular (known as "invar") has a coefficient of expansion which is almost inappreciable, although iron and nickel, separately, have coefficients of considerable magnitude. Chemically, nickel is a dyad. It has the chemical symbol Ni, and an atomic weight of 58.7 if $O=16$, or of 58.3 if $H=1$. Its most important oxides are the monoxid, NiO , and the sesquioxid, Ni_2O_3 .

The metal itself does not oxidize in air at ordinary temperatures, but only when strongly heated in contact with air or with steam. The monoxid, NiO , may be prepared by the direct oxidation of the metal at a high temperature in an atmosphere of steam, or by precipitating a solution of a nickel salt with caustic potash, and then heating the green nickel hydrate, $Ni(OH)_2$, which is thrown down. The monoxid is a green powder, which becomes yellow when heated, and from it the various nickel salts may be prepared. The sesquioxid, Ni_2O_3 , is a black substance, and is most conveniently prepared by adding a solution of bleaching powder to a soluble nickel salt. Nickel bromide, $NiBr_2$, nickel chloride, $NiCl_2$, and nickel sulphate, $NiSO_4 \cdot 7H_2O$, are used in medicine to a limited extent. Sulphuretted hydrogen gas precipitates nickel from alkaline solutions in the form of a black sulphide, having the formula NiS . (See CHEMICAL ANALYSIS.) Finely divided nickel absorbs dry carbon monoxid at 85° F., with the formation of a singular compound called "nickel carbon monoxid," having the formula $Ni(CO)_4$. This substance is a volatile liquid which freezes at 13° F. below zero, and boils at 109° F. Its vapor explodes violently when heated to 140° F., and deposits pure nickel when mixed with an inert gas and passed through a heated tube. Advantage is taken of this strange compound for the preparation of metallic nickel for chemical purposes, when great purity is essential.

Nickel Glance, a name applied to two nickel ores, one marked by the presence of arsenic, and the other by that of antimony. The first ($NiAs_2S_4$) is grayish, isomorphous or amorphous; consists of 35.5 parts nickel to 45.2 arsenic and 19.3 sulphur; and is found in Looe, Sweden, Ems, Germany, and Schlading, Styria. The second ($NiSb_2S_4$) is a chemical analogue of the first, found in Montemarba, Sardinia, Waldenstein in Carinthia, etc. It occurs in dodecahedral and tetrahedral crystals, but more frequently is amorphous. Its color varies from bluish to steel gray.

Nickel-Steel. Following the hint offered by iron and nickel alloys in meteorites, experiments in making nickel-iron and nickel-steel began 80 years ago when Faraday and Stodart alloyed nickel and iron (1822). Further experiments, to mention only a few names, were made by Wolf in Schweinfurt (1830), by Bessemer (1858), and by John Garagee of Connecticut (1883). The first systematic and practical tests of the value of nickel-steel were made by James Riley of Glasgow in 1888-9. The experiments of C. E. Guillaume of the International Bureau of Standards reported in 1899 showed that in addition to its previously known characteristics, the most notable of which were resistance to corrosion much greater than that of carbon steel and the remarkable combination of high resistance to stresses with great malleability and ease of working, nickel-steel, if containing more than 36 per cent of nickel, has the lowest coefficient of expansion known, thus proving an invaluable material for instruments of precision. Much more widespread, of course, is the use of nickel-steel for armor plate largely adopted because of its unequalled hardness and toughness and because its loss of strength from punching is only 15 to 20 per

NICKER—NICOL PRISM

cent of the original strength, whereas carbon steel loses about 33 per cent when punched. A second and more important use, though apparently limited by the expense of nickel-steel, is for rails; a test made by the Pennsylvania Railroad on the Horseshoe Curve resulted so favorably in 1902 that about 10,000 tons of nickel-steel rails (3.5 per cent nickel) were ordered by the company at a cost nearly double that of the carbon steel rails. Extensive use of nickel-steel seems impossible because of the limited annual production of nickel, the world's total for 1902 being only 8,600 metric tons. However, for ordinary uses only a very small percentage of nickel is required. The alloys with larger proportions of nickel (above 36 per cent) not only have a surprisingly low coefficient of expansion, but differ from the alloys with less nickel in respect to magnetism; alloys with less than 25 per cent of nickel can be made non-magnetic or magnetic to any desired degree; between 25 and 35 per cent the alloys have magnetism varying with temperature; and above 35 or 36 per cent the magnetism stays at its maximum for ordinary temperatures.

Nicker, in Teutonic mythology, water-fairies which dwell in rivers and lakes as well as in the sea. Mention is made of them in the poem of 'Beowulf.' The word seems originally to have been used as an indefinite name for any water-monster. Traces of it may be found in 'Old Nick,' nix, and nixy (borrowed from German *Nixe*).

Nicobar (nik-ō-bār') **Islands**, a group of 19 islands in the Bay of Bengal, between lat. 6° 45' and 9° 15' N. and lon. 93° and 94° E. with the Andamans (q.v.) to the north, forming a province of British India. The Nicobars consist of two groups—a southern group, composed of the islands Great and Little Nicobar and several smaller islets, and a northern group, separated from the southern by Sombrero Channel, about 36 miles broad. The largest island is Great Nicobar, 30 miles long by 12 miles broad, and the next Kamorta, which is the largest of the northern group. They yield coconuts, plantains, teak, sassafras, and pineapples. The thick forests and heavy dews render the climate unhealthy for foreigners. The coconut palm yields the chief food of the natives, and is almost the only tree cared for by them. The people belong to two races, an inland tribe, little civilized, who show Mongolian affinities and are regarded as indigenous, and the coast people, about 6,000 in number, who are of mixed Malay blood, but idle and lazy. They collect and export trepang and edible birds'-nests. The archipelago was occupied by Denmark, 1756-1856. In 1869 it was annexed by Great Britain, to put a stop to the piracy of the people. A penal colony for India exists at Nancovory on the island Kamorta.

Nicobar Pigeon. See **PIGEONS**.

Nicodemus, nīk-ō-dē'mūs, ruler of the Jews, that is, a member of the Sanhedrin, who belonged to the sect of the Pharisees, came to see Jesus secretly by night, and eventually after the Resurrection is traditionally said to have become one of his disciples. He protested against the injustice with which Christ was treated by the council (John vii. 50) and after the crucifixion joined with Joseph of Arimathea in giving fitting

sepulture to the body of Christ. Some commentators have fancifully identified Nicodemus with the rich young man (Mark x. 17-24), but there seems to be no solid ground for the conjecture.

Nicol, nīk'ol, **Erskine**, Scottish artist: b. Leith, near Edinburgh, 3 July 1825. He was educated in art at the Trustees' Academy, Edinburgh, under Sir William Allan. He resided some time in Dublin, where he painted portraits and subjects of humorous genre. Here he gathered material for his numerous clever pictures of Irish peasant life, among which may be mentioned 'Donnybrook Fair' (1859); 'Paddy's Mark' (Corcoran Gallery, Washington); 'Paying the Rent' (Vanderbilt Collection, N. Y.).

Nicol Prism, a piece of apparatus invented in 1828, by William Nicol, for the production of a beam of plane-polarized light. Its operation is

FIG. 1.

based upon the fact that when a beam of ordinary light enters a crystal of Iceland spar (crystallized calcite) from certain directions, it is decomposed into two beams, each of which is plane-polarized. One of these beams is called the "ordinary ray," and the other the "extraordinary ray"; and as the mineral exerts a different refractive power upon the two, they are divergent within the crystal. Nicol conceived the idea of introducing a surface of discontinuity within the crystal, disposed at such an obliquity that one of these rays would be totally reflected, while the other would be transmitted, and allowed to emerge from the crystal in a direction parallel to that in which the incident beam entered it. His prism is made by cutting a rhomb of Iceland spar as indicated by the plane, ABCD, in Fig. 1, which passes through the obtuse angles of the crystal. The surfaces being then polished, the parts are cemented together again with Canada balsam, as shown in Fig. 2. The

FIG. 2.

ends are ground so as to make an angle of about 68° with the length of the rhomb, and a ray of ordinary light, upon entering the crystal as indicated at AB, in Fig. 2, is separated into two rays. Both are refracted, but the "ordinary ray," BD, is refracted more than the "extraordinary" one, BC; and BD strikes the plane of section of the crystal at such an obliquity that it is totally reflected to E, while BC, striking it at a less obliquity, passes through and emerges from the crystal at F. The sides of the rhomb

are usually blackened, so that the ordinary ray is absorbed at E, and destroyed. The Nicol prism is exceedingly valuable, as it gives a beam of light that is completely polarized, and entirely without color, when the incident light is white.

Nicola, nīk'ō-lā, Lewis, American soldier: b. Dublin, Ireland, 1717; d. Alexandria, Va., 9 Aug. 1807. He entered the English army in 1840, rose to the rank of major, but resigned and emigrated to America, where he settled in Philadelphia. During the American Revolution his military experience was of great assistance to the Colonies, and in 1783 he became brigadier-general. It was he who wrote to Washington what is known as the 'Nicola Letter,' in which it is suggested that the latter should be made king. He wrote 'A Treatise of Military Exercise' (1776).

Nicolai, nē'kō-lī, Christoph Friedrich, German publisher and author: b. Berlin 18 March 1733; d. there 8 Jan. 1811. From his father he inherited in 1752 the business of the Nicolai publishing company, which he made one of the foremost in Berlin. In his youth he was a friend of Lessing and of Moses Mendelssohn, with whom he founded the 'Bibliothek der schönen Wissenschaften' (1757), a critical review, and another literary journal, the 'Briefe die neueste Litteratur betreffend' (1761). But little by little he broke with the leaders of German thought and began to attack both the critical school and the romantic movement. Goethe and Schiller replied in 'Xenien' to his parodies of 'Werther' (1775), etc. Nicolai wrote a novel with a rationalistic purpose, 'Sebalduß Nothander' (1773), and merits praise for his excellent 'Description of a Trip through Germany and Switzerland' (1789), and for the historical value of his 'Anecdotes of Frederick II.' (1788-92). Consult the autobiography, edited by Löwe (1806) and the 'Life' by Gockingk (1820).

Nicolai, Otto, German composer: b. Königsberg, Prussia, 9 June 1810; d. Berlin 11 May 1849. He received his musical education from B. Klein of Berlin, and his first work produced in public was a 'Te Deum' performed at the Singakademie in 1833. In 1833 the Chevalier Bunsen obtained for him the post of organist at the chapel of the Prussian embassy in Rome, where he made careful study of Italian church-music. He was kapellmeister of the Court opera at Vienna 1837-9 and 1842-8, and subsequently of the Berlin opera. He founded the philharmonic concerts at Vienna for the purpose of securing worthy renderings of the Beethoven symphonies. His best-known work is his 'Die lustigen Weiber von Windsor' (libretto by S. Mosenthal), first presented at Berlin 9 March 1849, which won and maintained great success by its humorous characterization, invention, and technical skill. Consult Mendel, 'Life' (1866), which contains a list of all Nicolai's works, printed and in MS.

Nicolaiſt, nē-kō-lī'f. See NIKOLAIEV.

Nicolaitans, nīk'ō-lī'tānz, a sect mentioned in Rev. ii. 6, 15, as given over to idolatrous practices and impurity of life. They thus contravened the decree of the Council of Jerusalem, Acts xv. 20-29, and were accordingly accounted heretics. There seems to be no ground for supposing that this sect was founded by

Nicolas, the proselyte of Antioch, who was one of the seven deacons.

Nicollardot, Louis, lōō-ō nē-kō-lār-dō, French author: b. Dijon, France, 26 Nov. 1822; d. Paris, France, 21 Nov. 1886. His literary work is favorably known and among his more notable publications are: 'Journal of Louis XVI.' (1873); 'The Impeccable Theophile Gautier' (1883); 'La Fontaine and the Human Comedy' (1885); etc.

Nicolas, nīk'ō-lās, Sir Nicholas Harris, English antiquarian: b. Dartmouth 10 March 1799; d. near Boulogne 3 Aug. 1848. He was of French Protestant descent; served eight years in the navy (1808-16); studied law; and became the leading genealogist of his day. Hood, for instance, says that Miss Kilmansegg's ancestry 'Were enough, in truth, to puzzle Old Nick, not to mention Sir Harris Nicolas.' Among his many works are: 'Notitia Historica' (1824); 'History of Agincourt' (1827); 'Proceedings and Ordinances of the Privy Council of England, 1386-1542' (1834-7); 'Despatches and Letters of Lord Nelson' (1844-6), and 'History of Royal Navy' (down to Henry V., 1847).

Nicolaus (nīk'ō-lās'ūs) of Damascus, Greek historian. He lived in the time of Herod the Great and was intimate with that monarch. He tutored the children of Antony and Cleopatra. Of his writings, a 'Universal History' in 144 books, and his biography of Augustus, fragments of great value, remain. Consult Müller 'Fragmenta Historicorum Græcorum,' Vol. III., pp. 343-464.

Nicolay, nīk'ō-lā, John George, American author: b. Essingen, Bavaria, 26 Feb. 1832; d. Washington, D. C., 26 Sept. 1901. He came with his family to the United States in 1838 and settled in Illinois where he was educated in the public schools. He entered the office of the *Free Press* in Pittsfield, Ill., when 16 and later became its proprietor and publisher, soon making himself a political power in the State. In 1856 he entered the office of the secretary of state at Springfield, Ill., where he became a devoted adherent of Lincoln. When the latter was elected to the presidency Nicolay was appointed his private secretary, and as the duties of the office increased John Hay (q.v.) was selected as assistant secretary. Together they formed the plan of writing a biography of President Lincoln and gained his approval of their project. In 1865 Nicolay was appointed by the President to be United States consul at Paris, where he remained until 1869, and in 1872-87 he was marshal of the Supreme Court. In 1874 he began in collaboration with John Hay 'Abraham Lincoln, a History,' published serially (1886-90), and in book form, supplemented by Lincoln's 'Complete Works' in 12 vols. (1894). He also wrote 'The Outbreak of the Civil War' (1881).

Nicole, François Léon Etienne, frāñ-swā lā-ōñ ā-lā-ēn nē-kōl, Haitian poet: b. near Grande Rivière 1731; d. Cape François 1773. Educated in a Jesuit College, he went to Paris in 1750, where Voltaire introduced him to the Encyclopedists and Louis XV. granted him a pension in recognition of his talents. In 1769 he returned to Haiti, where he was in the governor's employ. He published: 'The Romance of the

Slave' (1766); 'Tropical Flowers' (1770); and 'New Poems' (1773).

Nicolas, Pierre, pé-är, French moralist: b. Chartres 19 Oct. 1663; d. Paris 16 Nov. 1695. Graduated from the University of Paris in 1684, he was a member of the Port Royal community, held a professorship in it, wrote many of its school-books, was one of its controversialists with the Jesuits, and shared in its vicissitudes. The Abbé Goujet, who wrote his 'Life' (1732), says that he aided in the preparation of some of Pascal's 'Lettres Ecrites par Louis de Montalte' ('Provincial Letters'; 1656), and translated the series into Latin (1658). His best work is in his 'Essais de Morale et Instructions Théologiques' (25 vols. 1671 et seq.), one of which 'On the Means of Preserving Peace,' was praised rather extravagantly by Voltaire.

Nicolas, in Molière's 'Bourgeois Gentilhomme,' a servant of the Monsieur Jodain, who understands and exposes her master's follies in an amusing way.

Nicolas, né-kô-lé-né, Ernesto, French singer, whose real name was Ernest Nicolas: b. Saint-Malo 1834; d. Pau January 1898. His splendid tenor was trained at the Conservatoire. He made his début in Paris in 1857, soon afterward devoted himself to Italian opera, and Italianized his name, returned to Paris and then toured Europe. His last years were spent off the stage, because of ill-health. He married Adeline Patti in 1886.

Nicoll, nîk'ol, William Robertson, Scottish clergyman and editor: b. Lumden, Aberdeenshire, 10 Oct. 1831. He was educated at the University of Aberdeen, and was Free Church minister of Dufftown (1874-7) and Kalso (1877-85). He became editor of several periodicals, including the 'British Weekly,' the English 'Bookman,' the 'Expositor,' and (1900) the 'British Monthly.' Among his publications are: 'Calls to Christ' (1881); 'John Bunyan' (1884); 'Ten-Minute Sermons' (1895); 'The Key of the Grave'; 'Sunday Afternoon Verses' (1897); 'Letters on Life' (1901). He also edited 'The Expositor's Greek Testament' (1897-1900) and the complete works of Charlotte Brontë (1902).

Nicollat, né-kô-lâ, Jean Nicolas, French explorer: b. Cluses, Savoy, 24 July 1786; d. Washington, D. C., 11 Sept. 1843. He came to the United States in 1832 to make a scientific investigation of the southern and western States, and was later engaged by the United States government to make an exploration of the far West. He published: 'Lettre sur les Assurances qui ont pour Base les Probabilités de la Durée de la Vie humaine' (1818); 'Mémoire sur le Mesure d'un Arc de Parallèle moyen entre le Pôle et l'Equateur' (1826); etc.

Nicolls, nîk'ôlz, Mathias, English colonial jurist: b. Plymouth, England, about 1630; d. Long Island, N. Y., 22 Dec. 1687. He was appointed secretary of the commission and captain under Col. Richard Nicolls, who was sent to capture New Netherlands in 1664. He became the first secretary of the province and a member of the governor's council and later was presiding judge of the court of assizes. In 1672 he was elected third mayor of New York, and in 1683 was appointed a judge of the supreme court of the colony.

Nicolls, Sir Richard, English colonial governor: b. Amptill, Bedfordshire, England, 1624; d. at sea 28 May 1672. During the civil war in England he joined the king's army, was placed in command of a troop of horse, and when the royalists were defeated fled to Holland, where he entered the service of the Duke of York, serving with him in the Continental wars. On the accession of Charles II. he was appointed gentleman of the bed-chamber to the Duke of York. In 1664 the king made him the chief of a commission appointed to settle the affairs of the New England colonies and to take New Netherlands from the Dutch. He sailed from England in the same year, and after stopping at Boston for a short time reached New Amsterdam on the 25th of August. The Dutch surrendered to him without resistance; he took formal possession of the city on 8 September, the Dutch officials shortly after taking the oath of allegiance to the English king. Nicolls changed the name of the province and the city of New Amsterdam to New York; and also gave Albany its present name. In 1665 he proclaimed the 'Duke's Laws' which had been prepared under his direction; this was the first code of laws in New York, and combined features of the English law with the Roman-Dutch law formerly prevailing in the province. In the same year he gave an English form of city government to New York city. His administration was efficient, and especially moderate and considerate toward the Dutch, and he was respected and trusted by English and Dutch alike. In 1666 he successfully settled some difficulties with the French and Indians; in 1667 resigned but did not leave the colony till the arrival of his successor Lovelace. He returned to England in 1668, and taking part in the war between England and Holland, was killed in the naval battle against De Ruyter in 1692.

Nicomachus, nî-kôm'â-kôs, surnamed GERASINUS, Pythagorean philosopher: b. Gerasa, Palestine, about 1st century A.D. He was one of the earliest writers on mathematics and music and his name became a synonym for mathematical accuracy. "You number like Nicomachus of Gerasa" being a Philopatrian proverb. He wrote a life of Pythagoras and several musical and mathematical works now lost. Enough, however, remains of his work to have greatly influenced the learning in the 15th and 16th centuries.

Nicomedia, nîk'ô-mé'dî-q, Asia Minor, an ancient city of Bithynia, its site occupied by the modern Izmid or Izmit (pop. 30,000), at the northeast corner of the Gulf of Izmid—the ancient Astacenus,—an arm of the Propontis or Sea of Marmora. It was named after its founder Nicomedes I. (278-250 B.C.) and was a residence of the Bithynian kings, a city of great splendor, and in later times a favorite place of resort with the emperors Diocletian and Constantine the Great. Arrian, the historian, was a native, and Hannibal committed suicide here. There are numerous interesting remains of the city.

Nicopolis, nî-kôp'ô-lîs, signifying 'City of Victory,' the name of many ancient cities. (1) **Nicopolis in Epirus** on the northern side of the Ambracian Gulf (Gulf of Arta), was built by Augustus in commemoration of his naval victory over Antony at Actium, the opposite promontory, which made him master of the Roman Em-

pire. Augustus built at the same time a temple on the neighboring hill in honor of Apollo, and instituted games to be celebrated every fifth year. It was probably the place where Saint Paul passed the last winter of his life, Titus iii. 12. Ruins of this city are still to be seen near Prevesa. (2) Now Nicopoli, a city on the Danube, in Moesia Inferior, built by Trajan in memory of a victory over the Dacians. There is still an important town here, in the principality of Bulgaria, capital of a district of same name, 54 miles west of Rustchuk and 234 miles northwest of Constantinople. It is the seat of a Greek archbishop and a Roman Catholic bishop. Bajazet I., the Turkish emperor, gained a victory here over Sigismund, king of Hungary, in 1396; the place was taken by the Russians in 1810, 1827, and 1877. Pop. 20,000. (3) A city in Lower Egypt, a little to the east of Alexandria, built by Augustus to commemorate his final victory over Antony.

Nicot, Jean, zhōā nē-kō, SIRUR DE VILLEMAIN, French diplomat: b. Nîmes 1530; d. Paris 5 May 1600. He studied in Paris, was a courtier of Henry II., and acted as envoy of Francis II. to Lisbon (1560), whence he introduced tobacco into France. To this circumstance the scientific name for tobacco, *Nicotiana*, is due. Nicot wrote a French dictionary, 'Trésor de la Langue Française' (1606).

Nicotiana, nī-kō-shī-ā'nā, a genus of plants of the potato family (*Solanaceae*), represented by the two species of tobacco (*N. tabacum* and *N. rustica*). These plants abound in all their parts with poisonous elements, the special and characteristic one in this case being the alkaloid nicotine, to which tobacco owes its peculiar narcotic properties. See TOBACCO.

Nicotin, or **Nicotine**, the characteristic alkaloid element of tobacco. For its properties and effects see TOBACCO.

Nicoya, nē-kō'yā, a gulf on the west coast of Costa Rica, extending inland north by west about 60 miles and from 20 to 30 miles in width. Along the shore are high mountains, and many picturesque inlets. Cape Blanco is at the entrance. Punta Arenas, on the east shore, is a port of entry.

Nietheroy, nē-tā-rō'ē, Brazil, a town of Rio de Janeiro, prior to 1894 the capital of the state, on Praia Grande Bay in the Bay of Rio de Janeiro, opposite the city of that name. It is noted for its elegant suburban residences. Pop. about 30,000.

Nicum, nīk'ūm, John, American Lutheran clergyman: b. Winneriden, Württemberg, Germany, 6 Jan. 1851. He was educated at Muhlenberg College, Allentown, Pa., and the Theological Seminary, Philadelphia, and, entering the ministry, held Lutheran pastorates at Philadelphia and Syracuse, and since 1887 has had charge of St. John's Lutheran Church in Rochester, N. Y. Since 1894 he has also been professor of mental and moral science in Wagner Memorial Lutheran College at Rochester. He has published 'Gleichnisse-reden Jesu' (1884); 'Confessional History of the Lutheran Church in the United States' (1891); etc.

Nibelungen Leid. See NIBELUNGEN LIED.

Niebuhr, nē'boor, Barthold Georg, German historian and classical scholar, the founder

of modern historical method: b. Copenhagen 27 Aug. 1776; d. Bonn 2 Jan. 1831. He was son of Karsten Niebuhr (q.v.); was educated by his father in his early youth; studied at Kiel (1794-6), at London and at Edinburgh (1798-9); and in 1800 entered the employ of the Danish government. He became director of the government's bank in 1804, and showed in this post and in the Prussian service, which he entered in 1806 much business ability, due, so he thought, to his life in England and Scotland. A quarrel with Hardenberg made Niebuhr's retirement necessary in 1810, soon after he had been engaged in financing a Prussian loan in Holland; he taught Roman history at Berlin for three years with such success that he was led to publish the first two volumes of his 'Roman History' (1811-12). But in 1813 he re-entered the Prussian government employ, took a prominent part in rousing national opposition to Napoleon; but his temper was overbearing and he soon broke with his superior, Stein. In 1816 he was sent as minister to the Vatican, brought about the understanding between Prussia and the Pope, signalized by the Bull 'De Salute Animarum' in 1821, and had his first opportunity of testing his critical theories as to early Roman history by topographical and other detail. In 1823 he retired from the diplomatic service and settled in Bonn, where he lectured on ancient and modern history. Niebuhr's great work was his destructive criticism of early Roman legend, and his reconstruction of this same period from the same mass of myth and legend; or, to put it more broadly and more truly, it was his application of this higher critical method to history. His 'Roman History' (1811-32, English version, Hare and Thirlwall, 1851), carrying the story of Rome down to the Punic Wars, was completed in an English form by Leonhard Schmitz in 'Lectures on the History of Rome from the First Punic War to the Death of Constantine' (1844). These two parts form a great collection of facts and material, and a wonderful exemplification of method, but the more popular and brilliant style of Niebuhr's pupil, Theodor Mommsen (q.v.), has made Niebuhr's work to a certain degree antiquated. He collaborated with Platner and Bunsen in their 'Description of the City of Rome'; founded with Böckh and Brandis the 'Rheinisches Museum', a classical review; edited the 'Corpus Scriptorum Historiae Byzantinae'; and wrote many minor philological and historical studies, besides editing new fragments of Gaius, Cicero, and Merobaudes. His 'Stories of the Greek Heroes' ('Griechische Heroengeschichte', 1842), originally written for his son, Marcus, is a famous juvenile. Niebuhr was a man of broad scholarship and catholic taste, as may be seen by his personal reminiscences and correspondence in Hensler's 'Lebensnachrichten über Niebuhr' (1838-9). Consult also the biographies by Classen (1876) and Eysenhardt (1886).

Niebuhr, Karsten, German traveler, father of B. G. Niebuhr (q.v.): b. Lüdingworth, Hanover, 17 March 1733; d. Meldorf, Prussia, 26 April 1815. In 1760 he entered the Danish service as lieutenant of engineers, and in 1761 joined the expedition sent by Frederick V. of Denmark to explore Arabia. All his companions in this expedition having died within a

year after their departure, he went on alone, and in 1766 returned to Copenhagen. The works in which he gave the world the result of his expedition are remarkable for their accuracy. They include: 'Beschreibung von Arabien' (1772); 'Reisebeschreibung von Arabien und anderen umliegenden Ländern' (1774-8). Consult his son's 'Karsten Niebuhrs Leben' (1817).

Niecks, néks, Frederick, Anglo-German composer and critic: b. Düsseldorf, Germany, 3 Feb. 1845. He was educated at Leipsic University and was a violinist and music teacher in his native city till 1865 when he settled in Scotland, where he was for some years engaged in teaching music, and since 1875 he has written much for musical journals. Since 1891 he has been Reid professor of music at the University of Edinburgh. He has published: 'A Concise Dictionary of Musical Terms' (1884); 'Chopin as a Man and Musician' (1888).

Niedermeyer, nê'dêr-mî-êr, Louis, Swiss composer: b. Nyon 27 April 1802; d. Paris 14 March 1861. He studied under Moscheles in Vienna, and in Italy with Fioravanti and Zingarelli; settled in Paris; and, having met with no great success in operatic music, such as 'Marie Stuart' (1844) and 'La Fronde' (1853), devoted himself to religious music, not only composing but teaching and editing a journal called 'La Maîtrise'. His opera 'Stradella' and his melody for Lamartine's 'Lac' are his best compositions of a secular sort. His training school for religious music was aided by the French government.

Niederwald, nê'dêr-vâlt, Germany, the western termination of the Taunus range in the Prussian district of Wiesbaden, abutting on the Rhine opposite Bingen. On a commanding site near its summit was erected, 28 Sept. 1883, the national memorial commemorative of the successful war of 1870-1. An extended pedestal, ornamented with allegorical figures, is surmounted by a bronze figure of Germania, 34½ feet in height. The whole was designed by Schilling, a Dresden sculptor. Toothed-railways carry visitors up to the monument from the villages of Rüdesheim and Assmannshausen at the foot, both noted for their wine.

Niehans, nê'hows, Charles Henry, American sculptor: b. Cincinnati, Ohio, 24 Jan. 1855. He learned his art in the Royal Academy of Munich, Germany. He was there awarded a medal. A high award was received by him at the World's Columbian Exposition. His work is seen in the Congressional Library, Washington; Trinity Church, N. Y., and the Appellate Court House, in the same city.

Niel, nê-êl, Adolphe, French marshal: b. Muret, Haute-Garonne, France, 4 Oct. 1802; d. 14 Aug. 1869. He was educated at the Ecole Polytechnique, Paris, and the Military School, Metz, and in 1835 became captain of engineers. He took part in the expedition against Constantine in Algeria 1836-7; commanded the engineers at the siege of Rome in 1849 during the revolutionary movement under Garibaldi, and as chief of engineers planned the operations against Sebastopol in 1854-5. He figured prominently at Magenta and Solferino in the Italian campaign of 1859, was made a marshal of France by Napoleon III. in return for his services, and in 1867 became minister of war.

Niel's Work, in art, a method of ornamentation much practised in the Middle Ages, and to which may be traced the origin of engraving. The lines of a design are cut in a piece of gold or silver; it is then covered with a black composition consisting of copper, silver, lead, and sulphur, and a little borax is sprinkled over it by subjecting it to heat over a fire, the composition becomes liquid and runs into the lines of the design; the whole is then allowed to cool, when the surface of the metal is scraped and burnished, leaving the drawing in black upon the metal. The art is still practised as a mode of ornamenting ware, but its principal use is for door-plates, plates for shop fronts, etc., in which the brass or zinc plates are engraved and the depressions filled with wax. The term is also applied to impressions in a viscous water-ink on paper from metal-plate engravings taken by the early fathers of copperplate printing for testing the state of their work. See ENGRAVING.

Niemann, nê'mân, Albert, German operatic tenor: b. Erxleben, near Magdeburg, 15 Jan. 1831. At first a worker in a machine factory, he became an actor in 1849; was trained in singing by Schneider, hofkapellmeister at Dessau, and by Musch, a baritone; appeared at Berlin, Stuttgart, and Königsberg; and after further study under Duprez at Paris, was made 'kammersänger' to the emperor and attained great success throughout Germany. From 1866 until his retirement in 1889 he was connected with the court opera of Berlin, where he was distinguished in heroic roles. Wagner selected him to impersonate Siegmund in 'Die Walküre' at Bayreuth in 1876. He appeared with success in the United States in 1887-8.

Niemen, nê'mên or nyêm'ên, a river of Russia, with 70 miles, the lower part of its course of 500 miles, lying within the province of East Prussia, where it is called the Memel. It rises a few miles south of the city of Minsk. It is navigable to Grodno; below Tilsit it divides into two branches, which reach the Kurisches Haff each by four mouths.

Niemeyer, nê'mî-êr, Felix von, German physician, grandson of the poet and theologian August Hermann Niemeyer: b. Magdeburg 31 Dec. 1820; d. Tübingen 14 March 1871. He was educated at Halle; practised in Magdeburg 1844-55; was professor of pathology and therapeutics at Greifswald, and from 1860 at Tübingen; was military surgeon during the Franco-Prussian war; was ennobled for his services to the king of Württemberg; and wrote a 'Text-Book of Special Pathology and Therapeutics' (1858), often republished and distinctly valuable.

Niepcé, Joseph Nicéphore, zhô-zêf nê-sâ-fôr nê-êps, French inventor: b. Châlons-sur-Saône 7 March 1765; d. Gras, near Châlons, 5 July 1833. He served in the French army, was administrator of the district of Nice 1795-1801, then devoted himself to chemical and mechanical studies at Châlons, and from 1811 to lithography. His researches in photography began in 1813, and by 1824 he was successful in obtaining permanent impressions of the images of the camera obscura. In 1826 he joined Daguerre in a further prosecution of the investigations. An article of their agreement seems to

makes it clear that the real credit for the discovery of photography belongs to Niepce, and that Daguerre was merely an important aid in its development. Consult Fouqué, 'La Vérité sur l'invention de la Photographie' (1897). See also DAGUERRE; PHOTOGRAPHY.

Nietzsche, Friedrich Wilhelm, German philosopher: b. Röcken 15 Oct. 1844; d. Weimar, 25 Aug. 1900. He studied philology at Bonn and Leipzig, and held the professorship of classical philology at Bale from 1869 to 1879. The next two years were spent at different health resorts. In 1889 he became insane and died at Weimar in 1900. His most important writings are: 'Die Geburt der Tragödie' (1872); 'Unzeitgemässe Betrachtungen' (1873-76); 'Menschliches allzu Menschliches' (1878); 'Also sprach Zarathustra' (1883-92); 'Jenseits von Gut und Böse' (1886); 'Zur Genealogie der Moral' (1887); 'Der Wille zur Macht' (1895).

Nietzsche's theories may conveniently be divided into three periods; the first, which may be called the æsthetic period, extending until 1878; the second, the intellectual or positivistic period, until about 1883, and the third, or ethical, until 1889. The relation between these periods has been much discussed, and many critics have denied the existence of any unifying principle. On the other hand, the whole of Nietzsche's philosophy often seems an attempt to answer the question as to the nature of the chief good, and the chief radical differences in the three periods may be explained as due to changes in his standard of valuation.

(1) During this period Nietzsche accepted Schopenhauer's general standpoint, especially his emphasis upon the priority of will to intellect and his pessimism, but regarded the latter as resulting in increased artistic activity rather than in quietism. The ultimate values are those of the artist, and the two great forces in art are typified by the Greek gods, Apollo and Dionysus. The former is the dream, which, conscious of its own illusion, mirrors appearances. The latter is the intoxication that marks the breaking forth of the underlying reality. The hope of modern art lies in the union of the two in the Wagnerian opera, an estimate of Wagner later to be contradicted.

(2) With the beginning of the intellectual period, a logical rather than an æsthetic value is made supreme.

(3) The third period is by far the most important, since it contains the most characteristic and original of Nietzsche's views; and here the ultimate value is one of conduct rather than of thought or feeling. The basal reality is the will for power, a metaphysical principle which is extended from human activity to the universe, but which as such receives only vague treatment. The ethics is both negative and positive, in that it consists, first, of a criticism of existing moral distinctions, and, second, of the exposition and defense of a new moral ideal. Historically there are two moralities, each with its own set of opposites. Good and evil, the first pair, are valuations of the ruling classes, for whom everything that expresses or furthers the will of the individual is good. All that he does or likes, his passions, his ideas, all that forms a part of himself is good; while whatever is different is evil. The other pair of valuations, good and

bad, belongs, on the contrary, to the slaves, and here whatever characterizes the ruler and so is inconvenient or painful to the subject, is stigmatized as bad, while good is applied to all those qualities and actions that make life easier. It is essentially the morality of suppressed resentment; and whereas the seal of aristocratic approval is set upon the positive traits of the healthy animal, such as courage, self-assertion, and desire for unrestrained freedom, to the slave good means meekness, sympathy, and obedience. The present European standards are those of the slaves, and Nietzsche even affirms that they have become such largely through a deliberate plot of the Jews, at the beginning of the Christian era, to revenge themselves upon their Aryan conquerors by foisting upon them an ignoble standard of worth.

The aristocratic moral ideal that Nietzsche would substitute for this one takes self-assertion as its most essential characteristic. At the bottom of everything is the will for power; and all that makes for fullness of life is to be cherished, even though it overrides all our ideas of morality and of religion. The so-called virtues of pity, humility, and the like are merely symptoms of weakness and degeneracy. Strength and pride, ruthlessness toward oneself and toward others, courage and love of battle, all mark the true man, who has put behind him prejudice and tradition. For such complete affirmation of life opposition is a necessity, and a good war sanctifies every cause. The impulses should be given full play, not weakened by despicable self-denial. Altruism is an offense against delicacy, and pain alone can bring about the proud isolation that is above all pettiness. Such a view of the chief good is by no means to be called hedonistic. There is doubtless a fierce joy in battle and in all sorts of conflict; but the end proposed and reached is not happiness. Power and power alone is the good.

The two doctrines most often associated with Nietzsche's name, though they are not essential to his ethics, are those of the Superman and the Eternal Recurrence. The first is the end and justification of human struggle, and in the earlier books is represented as a mystical product of the individual will, while later it is described as a higher species with the relationship to man that man has to the ape. The Eternal Recurrence is the theory, by no means new, that present events but form a part of an infinite cycle and thus will be endlessly repeated in every detail. The final test of Nietzsche's aristocrat is his willingness to accept such repetition even of the hardest conditions. The whole attitude toward life evidently makes the pessimism of the first period no longer possible; and the new standpoint is characterized by its author as tragic optimism, namely, the view that finds life worth while not in spite of but because of its pain. Nietzsche's theories have been much discussed and have exercised an unlooked for influence, especially among men interested primarily in art or in social reform; and many consider them the logical outcome and application of Darwinism.

Nietzsches' (1891-2); Dolson, 'The Philosophy of Nietzsche' (1901); 'Cornell Studies in Philosophy' No. 3; Drews, 'Nietzsche's Philosophie' (1904); Blandes, 'Friedrich Nietzsche' (1898); Kronenberg, 'Nietzsche und seine Herrenmoral' (1901).

GRACE NEAL DOLSON,
Professor of Philosophy, Wells College, Author
of 'The Philosophy of Nietzsche.'

Nievre, nè-avr, France, a central department, bounded by Yonne, Cher, Allier, Saône-et-Loire, and Côte-d'Or; area, 2,658 square miles; capital, Nevers. It receives its name from the Nièvre, a small tributary of the Loire. The soil is generally rocky and sandy, cut up by ramifications, almost always wooded, of the mountains of Morvan. There are several plateaux more or less fertile, a number of hills covered with vines, and valleys productive in pastures; but the principal wealth consists in forests and minerals. The Nièvre, whence the name of the dept., is an inconsiderable affluent of the Loire from the right. The three chief rivers—the Allier, Loire, and Yonne—are navigable, and the Yonne, which belongs to the system of the Seine, is connected with the Loire by a canal across the watershed. Of the entire area, more than 792,000 acres are cultivable land, and more than a third of the whole surface is covered with forests, the timber from which, forming one of the principal sources of wealth, is conveyed by water in great quantities to Paris, etc. About 6,000,000 gallons of wine are made yearly. Its minerals include iron and coal, and the chief manufacturers are woolen cloths, linen, cutlery, etc.

Nidhheim, nîf'hîm, in Scandinavian mythology, the region of endless cold and everlasting night, ruled over by Hela. It is separated from Muspelsheim, the kingdom of light and heat, by a huge chasm (Ginnungagap yawning gap). Here flows the spring Hvergelmir, watched by the dragon Nidhugger; this spring sends out 12 ice-rivers, from the drops of which, thawed by sparks from Muspelsheim, sprang the chaotic giant Ymir and the cow Audhumbla.

Nigel, nîg'el, English satirist of the close of the 12th century, sometimes called WIKKKE. A monk at Christ Church priory, Canterbury, he wrote various verse, the most important of his poems being the 'Speculum Stultorum,' in which as in the prose work 'Contra Curiales et Officiales Clericos,' he boldly attacked the vices of his fellow-ecclesiastics. The 'Speculum Stultorum' or 'Mirror of Fools,' with its story of the ass Burnellus who wished his tail was longer, enjoyed great popularity.

Nigella, a genus of plants of natural order *Ranunculaceæ*, having five colored spreading sepals; 5 or to small two-lipped petals, with tubular claw; the carpels more or less connected together, many-seeded; leaves divided into threadlike segments, flowers solitary at the top of stem or branches. They are annuals, natives chiefly of the countries near the Mediterranean and warmer temperate parts of Asia. Some,

occasionally seen in gardens in Britain, are vulgarly known by the names *Devil in a bush* and *Devil in a wrist*. The seeds are aromatic, and somewhat peppery. Those of *N. sativa* species common in cornfields in Southern Europe, are supposed to be the *black cummin* of the ancients, perhaps the *cuminum* of the Bible. The seeds of a specie of *Nigella* are much used by the Afghans for flavoring curries.

Niger, nî-jér, or Joliba, jôl't-ba, a river of West Africa, the third in size of the African continent, known by various native names throughout its course, being the Joliba in its upper reach, the Mayo Balloo and Issa Eghirren in the central reach, and the Kwarra or Quorra in its lowest reach. The upper and central reaches are politically controlled by France, and the lower reach, through Northern and Southern Nigeria, by Great Britain. The Niger rises on the eastern slope of Mount Yenkina on the boundaries of Sierra Leone and Liberia, about 175 miles from the west coast, its headwaters being contiguous to those of the Senegal which flow in an opposite course. It flows northeast as far as Timbuktu, 300 miles above which it is joined by the Bani, a large tributary, and splits up into numerous diverging channels and lakes. After passing Timbuktu it flows east for 200 miles, then turns southeast through a rocky country past Say. At about 11° 40' N., just above Ilo, it enters British North Nigeria, at Giri being joined by the Sokoto River from the east. At Bousa navigation is impeded by dangerous rapids. Finally after a long southwestern curve to Bida, it bends more to the south and is joined by a tributary of first-class size, the Benue, or Mother of Waters, a rival in volume which has come from a source 860 miles to the east. The united stream now "passes through a series of bold picturesque hills by a narrow gorge," and eventually breaks up into one of the most remarkable mangrove-covered deltas of the world. This delta, malarious and unhealthy, covers an area of about 14,000 square miles, completely intersected by branches of the river, the principal of which, the Nun, runs through the middle of the delta. The westernmost branch, the Benue, has a bar, which presents a great difficulty to navigation. Other mouths or branches are the Bonny, New Calabar, Brass, and Forcados, distributing the Niger's waters into the bights of Berin and Biafra in the Gulf of Guinea. In its course the Niger passes through much fertile valley land, while numerous towns and villages stand on its banks, and a considerable canoe commerce is prosecuted. Slaves were formerly nearly the only article of export from the Niger, but palm oil is now the principal staple, the delta outlets being known as Oil rivers. The whole course of the river is about 2,500 miles, and the area of its basin is estimated at 584,000 square miles. Mungo Park was the first European traveler to explore any part of this river (1796-7) and was drowned in the Bousa rapids. The honors of modern exploration are divided between French, British, and German travelers Consult Bindloss, 'In the Niger Country' (1898); Houran, 'Sur le Niger' (1897); Mockler-Ferryman, 'Up the Niger' (1892).

Nigeria, nî-jér'-a, or Niger (nî-jér) Territories, West Africa, an extensive British colonial possession on the lower Niger, organized

NIGGER CHUB—NIGHTINGALE

since 1900, within the boundaries arranged by the Anglo-German Agreements of 1885, 1886, and 1893, and the Anglo-French Agreements of 1889, 1890, and 1898. It comprises the Lagos Protectorate and Southern and Northern Nigeria, being bounded on the east by German Kamerun, and on the west and north by Dahomey and the French military territories. Nigeria includes the whole course of the Niger from a short distance above Ilo to its mouth, and also the left bank for a few miles higher up. The northern boundary runs irregularly eastward to a point on Lake Chad. Nigeria also includes the whole course of the Benue from a point above Yola to its confluence with the Niger at Lokoja. The coast-line extends from the Rio del Rey on the east, to near the mouth of the Benue River on the west, and thus includes all the mouths of the Niger. The total area is about 500,000 square miles; the mixed negro population may amount to 30,000,000, chief of which are the Fulah or Fulani of the Hausa states. For administrative purposes the territory is divided into Northern and Southern Nigeria, the boundary line being drawn due east from Owo, on the Lagos frontier. The country is mainly a level or rolling plateau, but in the central districts there are mountain ranges and isolated peaks, many of them forest-clad, of considerable elevation. The Niger and the Benue are the chief rivers, the latter being especially valuable for navigation. The Gulbin-Sokoto is a perennial left-bank tributary of the Niger, and the Waube, flowing into Lake Chad, is also of some importance. The climate is tropical, with a dry (October-May) and a wet season. During the latter the rains are often extremely heavy and accompanied by severe thunderstorms. The mean annual temperature is about 80° F., but at some periods of the year the temperature in the shade may exceed 100°. The delta lands are unhealthy, and the same may be said of much of the interior, but the climate of the elevated districts is generally quite suited to Europeans. Geologically, the region is formed mainly of granite and various metamorphic rocks, but sedimentary formations, chiefly sandstones and almost entirely belonging to the older periods, are also found. Silver, tin, antimony, lead, iron, and other minerals occur. Among the vegetable and agricultural products, most of which are exported, are cotton, indigo, palm-oil, palm kernels, ground-nuts, india-rubber, ebony, camwood, gums, and coffee. Ivory and hides are also important exports, and among the native industries leather-working deserves mention. The chief towns of Southern Nigeria are: Asaba, Onicha, Akassa, Idda, Wari, Burutu, Brass, New Calabar, Bonny, Opobo and Old Calabar, all ports with custom-houses; Ado and Benin. The chief towns of Northern Nigeria, which consists mainly of the former Sokoto empire and the larger part of Bornou, are: Lokoja, at the confluence of the Niger and Benue; Kano, Sokoto, Gando, Ilorin, Yakoba, Kuka, Yola, Ilo and Katsena. The greater part of Nigeria was administered by the Royal Niger Company till 1 Jan 1900, when it was bought out by the British government. This company was formed in 1882 as the National African Company, and four years later it received its royal charter. Most of what is now Southern Nigeria was not under the rule of the company,

but formed from 1884 till 1893 the Oil Rivers Protectorate, and from 1893 till 1899 the Niger Coast Protectorate. The kingdom of Benin was incorporated in the Niger Coast Protectorate in 1897. The company's abolition of the legal status of slavery, and its prohibition of the importation of spirituous liquors into Northern Nigeria, are to be maintained by the imperial government.

Consult: Bindloss, 'In the Niger Country' (1899); Mockler-Ferryman, 'British Nigeria' (1902).

Nigger Chub, or **Nigger Dick**, a dark-green chub (q.v.) of the Mississippi Valley, distinguished by the three-lobed condition of the under jaw. See CUTLIPS.

Nigger Toes. See BRAZIL NUT.

Night, in Greek mythology, Night (Nyx) was personified as a powerful goddess, who by means of sleep exercised power over men and gods. She was the daughter of Chaos, wife of Erebus, and mother of Æther and Hemera (Day), of the Fates, Sleep, Death, Dreams, Hunger, Fear, Nemesis and Strife. By day she dwelt in Tartarus enveloped in thick clouds.

Night-ape. See DOUGOUCOUL.

Night-blindness, a defect of vision; nyctalopia (q.v.). See SIGHT, DEFECTS OF.

Night-hawk, or **Bull-bat**, an American nightjar or goatsucker (*Chordeles virginianus*). It arrives in the northern States about the middle of May, and is crepuscular and nocturnal in habits, pursuing insects on the wing with great activity, and often at a great height in the air, frequently over towns and cities. It retires in the daylight hours to the woods, or an orchard, and sleeps sitting lengthwise on some large horizontal limb, or on a log, where its grayish mottled plumage, blending with the color of the old bark, makes it unnoticeable. When flying it often utters a harsh scream, and also, when dropping suddenly through the air, as it often does, it produces a strange booming sound. The night-hawk attains a length of 9 or 10 inches. It is blackish-brown on the upper parts, barred and mottled with grayish and buff; a large wing-spot, bar across the tail, and V-shaped blotch on the throat, are white in both sexes and is the easiest mark of recognition. The tail is forked, and is a little shorter than the wings when in repose. The gape is large and the rectal bristles are inconspicuous.

The eggs, two in number, oblong shape, and dirty bluish-white sprinkled with dark olive-brown, are produced about the middle of May, and are deposited on the bare ground in a dry situation, no nest being constructed.

Night-heron. See HIRON.

Night Schools. See EVENING SCHOOLS.

Nightingale, nít'ing-gál, Florence, English philanthropist, best known for her work in the hospitals during the Crimean war, when she revolutionized army nursing: b. Florence 15 May 1820 she early became interested in hospital work, examined various hospitals through Europe, and was trained as a nurse by the Protestant Sisters of Mercy at Kaiserwerth-on-Rhine. In 1854 she went to the Crimea, having organized a band of trained nurses in a week, and established the great hospital at Scutari, where

NIGHTINGALE—NIGIDIUS FIGULUS

she showed rare gifts of organization and heroism. Her health failed suddenly because of her severe efforts; but she refused to accept for herself the subscription of £50,000 raised for her, preferring to use it for the foundation of the Nightingale Home at Saint Thomas Hospital. She was frequently consulted by Royal Commissions in regard to field- and camp-hospitals, and gave valuable advice during the American Civil War and the Franco-Prussian war. She wrote: 'Notes on Hospitals' (1859); 'Notes on Nursing' (1860); 'Lying-In Institutions' (1871), and 'Life or Death in India' (1874). She died 13 Aug. 1910.

Nightingale, a celebrated song-bird of the family *Sylviidae* or Warblers. The nightingale (*Luscinia luscinia*) is attractive for no lustre or brilliancy of plumage, the upper parts of the body being rusty-brown tinged with olive, and the under parts pale ash, blending into white at the throat and belly. Its average length is about 6 inches. In habits the nightingale is active and lively; it frequents trees of small size and bushes, and subsists chiefly upon an insectivorous dietary. It is a migratory bird, and occurs throughout Europe, but in Great Britain is limited to certain districts, so that it is never or rarely heard in Wales nor in the most western districts of England, nor in Ireland or Scotland. The song continues until the middle of June, when the young are hatched. The male bird sings during the day, and at night also and perhaps more frequently, while the female is incubating; and the flood of song poured forth in the stillness of the evening forms one of the chief sources from which the reputation of the nightingale has been derived. The nest is of rough construction. It is generally formed of leaves and grasses, and is situated mostly in damp places or in the neighborhood of water. The eggs number from four to five, and are of an olive-green color. These birds live in confinement. The bird-catchers, if possible, take the males before the arrival of the females. Birds trapped after the pairing season are said to languish and die. Another species, formerly regarded as identical with the above, is *D. philomela*, which has a more easterly distribution, extending far into western Asia. This is the bird most often referred to in literature as the Persian bulbul; and it takes a prominent place in classic mythology. Nightingales endure captivity well and are kept as cage-birds in all parts of the world. See *CAGE-BIRDS* and the authorities there mentioned; consult also Newton, 'Dictionary of Birds' (1896) and the writings of British ornithologists.

Nightjar, a bird of the family *Caprimulgidae* (q.v.). This name was first given to a single species, that common in the British Islands, on account of the jarring note it utters after dark; but most of the members of this nocturnal family produce similar sounds, and the term seems preferable in many respects to the erroneous designation "goatsuckers" traditionally applied to them in southern Europe and which should long ago have been abandoned. American representatives are the nighthawks, whippoorwills, and chuck-will's-widow, elsewhere described. The British nightjar is much like the American whippoorwill in appearance, and is known by many provincial names, such as dor-hawk, churrow, owl, fern-owl, etc. Consult: Montagu, 'Dic-

tionary of British Birds'; White, 'Natural History of Selborne.'

Nightmare, a sensation of oppression or of suffocation which sometimes occurs during sleep. The sufferer experiences a short period of intense anxiety, fear, horror, etc.; feels what seems an enormous weight on his breast; is pursued by a phantom, monster, or wild beast, which he cannot escape; is on the brink of a precipice from which he cannot remove, or is perhaps, rolling down it without being able to make any exertion for his safety; and his bodily members refuse to do their office, until he suddenly awakens himself by starting up, or by a loud cry; he is then in great terror, and the body is often covered with sweat. Nightmare is generally due to repletion and indigestion, and is often superinduced by lying on the back, especially when the head is low. A person subject to nightmare should carefully observe moderation in eating and drinking, should avoid heavy meals shortly before retiring, and likewise overrich food. Alcoholic excess may lead to nervous disorders characterized by conditions, physical and psychical, which increase liability to nightmare and similar forms of disturbance. See *DELIRIUM*; *INCUBUS*; *MAIA*.

Nightmare Abbey, a novel by Thomas Love Peacock, the hero of which is a caricature of Shelley. It was published in 1818.

Nightshade, any of several plants of the order *Solanaceae*, sometimes called nightshade family, especially distinguished for toxic properties, and constituting the typical genus *Solanum*. The common or black nightshade (*S. nigrum*), an annual or biennial, with erect angular stem, ovate, sinuate-dentate leaves, drooping lateral umbels of white flowers, and globose black berries, grows as a weed in waste place in most parts of the world. It is only slightly narcotic. The leaves in a fresh state are said to be injurious to animals which eat them, but seem to lose almost all narcotic property by boiling, and are used as spinach, particularly in warm climates. The berries, though generally dreaded or suspected, may also, it is said, be eaten, at least in moderate quantity, without danger. They contain, however, the alkaloid solanine found also in the shoots of 'h' potato. Several comparatively innocuous species such as the horse-nettle or apple of Sodom (*S. carolinense*) with orange-yellow berries, are natives of the dry western portions of the United States and Canada, and one, the bittersweet, blue bindweed, felon wort, poison-flower or woody nightshade (*S. dulcamara*), is naturalized all over the eastern half of the country (See *DULCAMARA*.) The deadly nightshade (see *BELLADONNA*) is a member of an allied genus, whose toxic principle is atropin (q.v.).

Nigidius Figulus, Publius, Roman scholar; b. about 98 B.C.; d. 44 B.C. He took part in political affairs during the closing days of the Republic; became praetor in 59 B.C.; and having sided with Pompey in the civil war was compelled by Caesar to live in exile. In philosophy he was a Pythagorean; and for the scope of his learning he was ranked by Aulus Gellius next to Varro (q.v.). His fame as an astrologer was great, and in the 'Chronicle' of Eusebius he is styled 'Pythagoricus et magus.' Gellius complains of the obscurity and

subtlety of Figulus' writings, but the examples he adduces in proof are not thought by critics to support the assertion. The fragments extant have been edited by Swoboda (1889). Consult also Röhrig, 'De Nigrido Figulo' (1887).

Nigritia, ni-grish't-a. See SUBAN.

Nihilism, from the Latin *nihil* (a trifle, nothing), the state or condition of nihilism, being nothing. A general term used to define a Russian socialistic movement, and a name also applied in metaphysics to the doctrine that refuses a substantial reality to the existences of which man is conscious. In Russia the word Nihilist was first applied by Ivan Tourgenieff to the hero of his novel 'Fathers and Sons,' who was intended to be the personification of a movement in Russia for the emancipation of women, the independence of children, and the spread of natural religion.

Doctrine of Nihilism.—Followers or believers in Nihilism are those who disbelieve in any improvement in the social condition of progress of man; particularly members of any association devoted to the work of destroying the present form of the Russian government without any hope or definite theory of substituting another government in its place. Nihilism appears to have permeated every stratum of Russian society, and its recruits and followers are gathered from every social grade, alike from the nobility, the army and the peasants.

Early History.—As early as 1818 a party of freedom, so-called, was organized in Russia, and on 14 Dec. 1825, occurred the rising of the Decembrists among the officers and soldiers of the army. These revolutionists aimed at the emancipation of the serfs and the introduction of constitutional government. The revolt was quelled, and six of the leaders were executed and 125 others imprisoned or exiled. About 1850 liberal ideas received an impetus from the study of socialistic writers of other countries. On 23 April 1849, some 40 persons were arrested who belonged to an association formed by Petrashevsky, an official of the Foreign Office. These were sentenced to death, but the sentences were commuted to imprisonment and banishment. In 1857 Alexander Herzen founded a journal, the 'Kolokol,' in London, which had a remarkable influence upon the Russian youth. In the same year there arose in Russia a movement, under the leadership of Tschenshevsky, which criticised existing society. In 1864 he published a novel entitled 'What is to be Done?' which proved a revolutionary firebrand among the peasantry. Another writer, Shapoff, urged the introduction of self-government and local autonomy. Numerous organizations sprang up in the universities, and in 1863 the various secret associations united under the name of 'Land and Freedom.' In 1868, Bakunin commenced the publication of a newspaper in Geneva. In this journal he advocated the total abolition of the state and the substitution of small communities.

The Socialistic Propaganda.—In the early part of 1870, a number of young men and young women of the upper classes voluntarily went to work in the fields and the factories so as personally to carry on a Socialistic propaganda and distribute Socialistic literature. Their organs were the 'Forward' of London and the 'Workingman' of Geneva. This work continued about

six years, during which time there were 23 political trials of 417 persons, half of whom were condemned to exile in Siberia or to hard labor in the mines. During this period there existed a more moderate party, but it failed to satisfy the demands of the young men of the universities. In 1875 the 'Narodniki' became a prominent organization. The government became active, and during 1876 and 1877 the prisons were filled with propagandists.

The Party of Removal.—In 1877, former adherents of the Nihilistic movement organized a new and stronger secret party, which aimed at the removal by force of crowned heads, and a warfare against the government. On 24 Jan. 1878, a young woman of 28, named Vera Zasulich, shot at General Trepoff, who had caused a prisoner to be whipped for refusing to take off his hat to him. She was tried before a jury, and strangely enough, was acquitted. The government was enraged and had the verdict annulled. On 4 Aug. 1878 General Mesentzoff was killed, and 22 Feb. 1879, the Governor of Kharkov, Prince Kropotkin, was assassinated. On 2 April 1879, an attempt to assassinate the Emperor, Alexander II., was made by Solovieff. He was captured and hanged. Alexander II. (q.v.) was assassinated 13 March 1881.

The Will of the People.—Some time later at a secret congress held at Lipensk, the acquisition of political freedom was declared to be the first necessity. It was hoped to gain this by the formation of a legislative body, elected by the people, with guarantees for electoral independence, and liberty to agitate for reforms. This was demanded from Alexander III. (q.v.) shortly after the assassination of his predecessor as the price of cessation from violence. This new party, the 'Narodnaia Volia,' or 'Will of the People,' sought to overthrow despotism by the communistic instincts of the peasants. It set forth the following demands: (1) A representative assembly having supreme control in state matters; (2) provincial self-government with elective officers; (3) village communes; (4) freedom of conscience, press, speech, association, and political agitation; (5) suffrage; (6) a national militia instead of a standing army; (7) nationalization of land; (8) measures to socialize factories. This movement proved a total failure and the party collapsed in 1885.

Latter-Day Condition.—The present condition of Nihilism in Russia has been likened to a sleeping volcano. There have been no successful outbreaks nor assassinations although the secret party is said to exist in larger numbers than ever before. Within recent years the discoveries of the police show that Nihilism is widely spreading in Russia, not only among the working classes but among the aristocracy, and even in the army, especially in Saint Petersburg, and in many of the principal cities and towns. Secret affiliations are known to exist between the Russian Nihilists and the French and Italian anarchists.

Bibliography.—Kernan, 'Siberia and the Exile System' (1891); Krapotkin, 'Memoirs of a Revolutionist' (1899); Stepanak, 'Underground Russia' (1883); Tikhomiroff, 'Russia, Political and Social' (1887); and 'Russia under the Tsars' (1885).

Nihilist, in theology, one who taught 'Christus, secundum quod est homo, nihil est.'

that is, the human nature of Christ had no existence, so far as it could be called his. In other words Christ did not become anything different from what he was before, by assuming human nature, because no change can be wrought in the unchangeable God, and a man is not to be called a cloak because he puts one on. This was the view of Abelard, and John of Damascus, and was held to be tenable, at least, by Peter Lombard (see LOMBARD, PETER). It was condemned in the Lateran Council of 1179.

Nihongi, *nē-hōn-gē*, a Japanese historical work embracing records of ancient Japan. It was first issued in 712 and was fashioned on the model of Chinese histories.

Niigata, *nē-ē-gā-tā*, Japan, a seaport city, capital of the province of Echigo, on the west coast of the island of Hondo, nearly opposite the island of Sado, at the mouth of the Shinanogawa. It was one of the treaty ports opened in 1859, but owing to its unsuitable harbor, its foreign trade is nominal; its coasting and internal trade, however, is important and increasing, the province being rich in petroleum and minerals, and agriculture being well developed. Pop. about 60,000.

Nijmegen, *nī-mā-yēn*. See NIMWEGEN.

Nijne-Tagilsk, *nēzh-nē-tā-gīl'sk'*, East Russia, the chief town of the Ural Mountains mining region in the government of Perm, on the Tagil, 135 miles east of Perm. Its chief industrial establishments are the ironworks founded by Demidoff; iron, gold, copper, and platinum are mined in the surrounding district, which has a population of about 30,000.

Nijni-Novgorod, *nēzh-nī-nōv-gō-rōd*, or **Nizhni-Novgorod** ("Lower Novgorod"), Russia, a government bounded north by the governments of Kostroma and Viatka, east by Kazan and Simbirsk, south by Penza and Tambov, and west by Vladimir; area, 19,704 square miles. The capital is Nijni-Novgorod (q.v.). The surface forms an extensive plain, occasionally broken and diversified by low undulating hills. These hills are almost invariably composed of limestone, which is largely developed over the whole government. The only metal found is iron; gypsum prevails in every quarter. The entire government belongs to the basin of the Volga, which, entering it on the northwest, and traversing it in one vast curve to the east, drains a considerable portion of it directly, all the other drainage being brought to it by the Oka and its tributaries on the west, the Sura and its tributaries on the east, and the Senets and Vetluga on the north. The soil is of remarkable fertility, rendering this government the granary of Russia. The principal crops, in addition to the ordinary cereals, are hemp and flax. Much attention also is paid to the production of fruit. The extent of forest is equal to that of arable land, and there are tracts of excellent timber. Both manufactures and trade have made great progress. Several governments possess much larger establishments, but in none is the spirit of activity and enterprise more universal. The principal manufactures are coarse cloth, canvas, cordage, glass, soap, and leather. The same articles form important branches of trade, which includes besides corn, flour, hemp, and flax, iron and ironmongery, etc. The central position of this government, and its large navigable

streams are highly favorable to its trade. Pop. about 1,750,000.

Nijni-Novgorod, **Nizhni-Novgorod**, or simply **Nijniy**, Russia, the capital of a government of the same name, at the confluence of the Oka and Volga, 225 miles east of Moscow. It is of world-wide celebrity in connection with its great commercial fair which has been held here annually since 1816, lasts from 15 July to 1 September, and is attended by an average of 250,000 dealers and visitors, from all climes between Germany and China. There is an upper city containing the Kremlin, a lower city, and a suburb. The Kremlin, finely situated on the loftiest point of the high town, is surrounded by a lofty wall flanked with towers, round or square, and contains the principal edifices, particularly two cathedrals, the governor's palace, and an episcopal seminary. With the exception of these, the elegant church of the Holy Women, and a few other public edifices, the whole town is built of wood, and possesses little interest. It is, however, becoming noted, also, for its educational institutions, including schools, libraries and museums. For the convenience of those frequenting the fairs there is an enormous market hall, an electric street railroad, and 60 blocks of buildings for booths, containing more than 2,500 apartments separated by fireproof walls. The value of goods sold at one of these fairs often exceeds \$90,000,000. At these fairs all foreign goods are supplied in smaller quantities, those of Russian production showing an increase. Nijni-Novgorod, founded in 1221, was devastated on several occasions by the Tartars; its prosperity dates from 1816 when the great fair was removed to Nijni-Novgorod from Makarieff, after a great fire. Pop. (1897) 95,124.

Nika Riot. See JUSTINIAN I.

Nike, *nī-kē*, in Greek mythology, the goddess of victory: called by the Romans Victoria. In art she is generally represented as a winged female figure. Her attributes are a palm branch, a garland and sometimes a herald's staff.

Nike Apteros, or **Athene Nike**, a small but beautiful Doric temple standing on a bastion flanking the entrance to the Athenian Acropolis. It was torn down by the Turks in the 17th century.

Nikisch, *nē-kīsh*, **Arthur**, Hungarian orchestral conductor: b. Szentmiklos, Hungary, 12 Oct. 1855. He studied violin, composition and piano under Hellmesberger, Dessoff, and Schenker, respectively, in the Vienna Conservatory; was first violin in the Vienna Royal Opera orchestra for a year; and then in 1878 became musical director of the City Theatre of Leipzig. He directed the Boston Symphony Orchestra 1880-93, the Royal Hungarian Opera in Budapest 1893-5, and the Philharmonic concerts in Leipzig from that date up to the present. In Leipzig he conducts the famous Gewandhaus concerts. Nikisch wrote 'Die Christnacht,' and other music. Consult the study by Pfuhl (1900).

Nikita, *nē-kē-tā*, **Louise**. See NICHOLSON, LOUISE MARGARET.

Nikolaieff, *nē-kō-lī-ēf*, or **Nicolaiev**, Russia, a seaport, and the chief naval station on the Black Sea, at the confluence of the Ingul and Bug, 36 miles northwest of Kherson. It occupies a large space, is fortified and well built,

with wide streets and a finely planted boulevard. It is administered by a governor, who is also commander-in-chief of the Black Sea fleet. It was founded in 1791, and since its connection with the Russian railway system its trade and importance have vastly increased. Pop. about 100,000.

Nikon, nē'kōn, Russian patriarch and primate: b. 1605; d. 17 Aug. 1681. Having become a priest and a monk, he was appointed (1646) by the Czar Alexis Mikhailovitch to be archimandrite of the Novospasky monastery in Moscow. He was made metropolitan of Novgorod in 1648, and in 1652 became patriarch of Russia. In 1666 he was deposed and banished to a monastery. He died while on his way, by imperial permission, to the monastery of the Resurrection of Christ, which Nikon himself had built, and where he had gone into temporary retirement in 1658. He introduced reforms into the service of the Church, upheld monasticism, lived a life of exemplary devotion, and aimed at educational and social advancement of the people.

Nile Group, a marble statue of the Alexandrine period now in the Vatican. It shows a half reclining figure of a vigorous man representing the river Nile; he leans with his left arm on a sphinx; climbing over him are naked chubby children, intended, it is supposed, to typify the height to which the flooded river rises, namely, 16 cubits. The execution of the group is fine, and the whole treatment is peculiarly Alexandrine. The group was found at Rome near the church of Minerva, in the vicinity of a temple of Isis; but it was subsequently removed to the Vatican by the order of Pope Leo X.

Nile, a river of northeast Africa, celebrated from remote antiquity as the Egyptian Hope or Aur-Aa—Great River, the Hebrew Sihor, and the Greek Νῆλος, the largest river of the African continent, and the second in length of the rivers of the world. Its length is estimated at 4,000 miles, and the area of its basin at 1,082,000 square miles, extending through 35 degrees of latitude, or 2,450 miles in a direct line. The White Nile or Bahr-el-Abad flows from Victoria Nyanza, and is joined at Khartum by the Blue Nile or Bahr-el-Azrek which has its source in the Abyssinian Mountains. The principal feeder of the Victoria Nyanza and the head stream of the Nile proper is the Kagera, formed by three tributaries, the chief of which is the Nyavarongo, which rises in about 2° 30' S. at an altitude of about 7,000 feet; the Kagera flows through a delta into Victoria Nyanza just north of 1°. Other influents are the Katonga from the west, the Nzota from the northeast, the Morao and Ruvano from the east. The great river which flows out of Victoria Nyanza in the north at about lat. 0° 30' N., and lon. 33° 40' E., before its identity with the Nile was known, was called the Kari or Somerset River. At its outflow from the lake it forms the unimportant Ripon Falls, then flows northwest, and about lat. 1° 40' N. expands into Lake Ibrahim Pasha, discovered in 1874. On again contracting to the dimensions of a river it flows first west then northeast to lat. 2° 15' N., where it forms the Falls of Karuma. It then turns west, and after forming

the Murchison Falls, enters, at the town of Magungo, the Albert Nyanza, at an elevation of about 2,550 feet. Magungo lies on the east side of the lake, close to its northeastern extremity, and exactly at this latter point, about lat. 2° 35' N. and lon. 31° 22' E., the river again leaves the lake, flowing in a northerly direction. Above Gondokoro, a town lying about lat. 5° N., the river forms a series of cataracts, and till 1876 the part of the river lying between these cataracts and the Albert Nyanza was never fully explored. In that year under the direction of Colonel Gordon a steamer was carried in pieces round the cataracts to Dufile, and on 7 March Romolo Gessi started thence to sail up the river, and on the 18th of the same month reached the Albert Nyanza. The whole of this part of the river, 164 miles long, is navigable, deep, and broad, in many places with a breadth of upward of 700 yards.

Not far below Gondokoro, which is nearly due north of the outlet of the Albert Nyanza, the Nile begins to flow more to the west till it reaches lat. 9° N., where it receives the Bahr-el-Ghazal, the most important of the tributaries that flow into it from the left bank. On receiving this affluent it turns due east for about 100 miles, and then after receiving the Sobat from the southeast, a very important river draining the country between Abyssinia and the Victoria Nyanza, flows almost due north to Khartum. Here it is joined from the east by the Blue Nile or Bahr-el-Azrek, the source of which was discovered by Bruce in 1770 in the Abyssinian highlands, in lat. 11° N.; lon. 36° 30' E. It flows first north into Lake Dembea or Tsana, then emerges from it in an easterly direction, describes a great arc to the south, extending below lat. 10° N., then turns to the west, after some distance receives its southern tributary, the Dedheza, and lastly takes a northerly course. After receiving from the east the rivers Dender and Rahad, it joins the White Nile at Khartum. The united Nile then flows first to the northeast till at lat. 17° 30' N. it receives its last tributary, the Atbara, from the Abyssinian frontier. From its junction with the Atbara the Nile flows north, having on the west or left bank the desert of Bahiûda; on the east Mekheyr, which is commonly called Berber. Lower down it forms several islands, one of which bears the name of Kandake (Candace), and also one or more cataracts, it then bends west by south, and passes by Jebel Barkal, where stand the remains of a temple, repaired by Tirhaka (700 a.c.), but probably 1,000 years older. Resuming its northern course it enters the plains of Dongola, and forms several islands of great extent. Quitting these plains by a cataract the river flows through the districts of Mahas, Sukkot, Wadi, Kenûz, and Batn-el-Hajar (or the Glen of Rocks), at the head of which is the second or great cataract, and entering Egypt at Philæ—the Pi-lakh or limit of the Egyptians—it descends the lowest (in ascending the first) cataract to Syene or Assouan, which is in lat. 24° 5' N. From Philæ, lat. 24° 3' N., the Nile flows through Egypt in a single stream as far as Batn-el-Bakara, the ancient Cercasorum, at the head of the Delta, in lat. 30° 15', where it divides into two branches, leading down respectively to Rashid (Rosetta) and Dmyet (Dam-

NILE.

1. Rapids of the first cataract.
2. Nile boats near Cairo.

ietta), and entering the sea in about lat. 31° 35' N. These two mouths correspond, as is supposed, to the Phatnitic and Bolbitine mouths of the ancients, which, however, in ancient times were not so important as the Pelusian mouth on the east and the Canopic on the west, between which, proceeding from east to west, there were other five mouths, named respectively the Tanitic, Mendesian, Phatnitic or Bucolic, Sebenitic, and Bolbitine.

The Nile received divine honors from the Egyptians, and at a later period also from the Greeks and Romans. By the Egyptians he was represented as a hermaphrodite, with a beard and woman's breasts, and a skin of a blue color. The Upper Nile was distinguished from the lower by a peculiar floral symbol. The Nile had a temple dedicated to himself at Nilopolis, and his principal festival is mentioned under the name of Nilos. In Greek and Roman art he is depicted in the attitude of a river god reclining, around whom sport 16 children, an allegorical representation of the height in cubits of the inundations of the river.

As rain scarcely ever falls in the valley of the Nile from the 18th nearly to the 30th parallel, and very scantily even lower down, the river owes its supplies wholly to the copious rains of the countries wherein it rises. In Egypt it begins to increase in June, attains its greatest height in three months, and then subsides as gradually as it rose. The ordinary rise at Cairo is about 25 feet. During the flood a great portion of the Delta and of the valley of Egypt higher up, is inundated. In Sennaar also, and Dongola, extensive tracts are watered immediately by the river; but, in general, the banks of the Nile above Egypt are irrigated by means of the water-wheel. In early times the case was different, as is shown by the composition of the soil formed of alluvial deposits in places no longer reached by the stream, even in its highest state of flood. The changes of level which have taken place in relation to the river are demonstrated by the hieroglyphic inscriptions at Semneh, a day's journey beyond the second cataract, which attest that 4,000 years ago the average height of the Nile at its utmost flood was 23 feet higher than at the present day, while inversely the yearly inundations of the river in Egypt are continually raising the level of the whole surrounding valley.

The Nile reservoir, for which the great dams at Assouan and Assiout have been constructed, will enable wide tracts of land to bear two crops a year instead of one, will bring waste districts into tillage, and will greatly increase the area of sugar cultivation. The reservoir will supply 1,000,000,000 cubic metres of water annually. See article and illustration under ASSOUAN, Vol. II.; also EGYPT; IRRIGATION.

Niles, Hezekiah, American publisher: b. East Bradford, Chester, Pa., 10 Oct. 1777; d. Wilmington, Del., 2 April 1830. From 1800-5 he was engaged in the publishing business in Wilmington, Del., then moved to Baltimore, Md., where with George Bourne he edited and published the *Evening Post*. In 1811 he founded 'Niles' Register,' a weekly journal, which in 1837 he moved to Washington and published under the name of 'Niles' National Register.' While in Washington he obtained a position in the Pension Office, and gave up the editorship

of the 'Register,' which was moved back to Baltimore in 1838 and continued by his son and others till 1849. He published: 'Quill Driving,' a series of humorous essays; and 'Principles and Acts of the Revolution' (1822). The 'Niles' Register' was devoted chiefly to the discussion of politics, and is regarded as one of the most valuable sources for the study of the American history of the period; the volumes for 1812-27 have been reprinted.

Niles, John Milton, American journalist and politician: b. Windsor, Conn., 20 Aug 1787; d. Hartford, Conn., 31 May 1856. At 20 he began the study of law, and in 1817 settled in Hartford, Conn., where with the co-operation of others he established the *Hartford Times*, of which he was principal editor for several years, and to which he contributed for 30 years; through this paper he warmly supported Andrew Jackson and the Democratic party. Appointed postmaster of Hartford in 1829 he resigned on receiving the executive appointment to the United States Senate, a post which he retained till 1839. In 1839 and 1840 he was Democratic candidate for governor of Connecticut, and in the latter year was postmaster-general under President Van Buren. He was again elected to the Senate in 1842, and on the expiration of his term in 1849 retired from public life. He published 'The Independent Whig' (1816); 'Gazetteer of Connecticut and Rhode Island' (1819); 'Life of Commodore Oliver H. Perry' (1820); 'History of South America and Mexico, and a view of Texas' (1839); 'The Civil Officer' (1840); etc.

Niles, Nathaniel, American statesman: b. South Kingston, R. I., 3 April 1741; d. West Fairlee, Vt., 31 Oct. 1828. He was graduated from Princeton College in 1766 and subsequently studied medicine, law, and theology, and he preached in various Congregational churches in New England. He settled in Vermont after the American Revolution and there conducted religious services in his own house for nearly 40 years. He served in the Vermont legislature and was its Speaker in 1784, was a judge of the State supreme court and was a member of Congress in 1791-5. As 'censor' he assisted in the revision of the State constitution and he was six times presidential elector. He wrote the popular war song 'The American Hero' after the battle of Bunker Hill and published: 'Four Discourses on Secret Prayer' (1773); 'The Fountain of Good' (1777); etc.

Niles, Nathaniel, American lawyer: b. South Kingston, R. I., 15 Sept. 1835. He was educated at Phillips Andover Academy and was admitted to the bar in 1857. He has served for several terms in the New Jersey legislature of which he was Speaker in 1872 and where he has introduced important measures, notably those establishing 1,200 free school libraries and a free school fund of \$3,000,000.

Niles, William Woodruff, American Protestant Episcopal bishop: b. Hatley, P. Q., 24 May 1832. He was graduated from Trinity College, Hartford, Conn., in 1857 and from the Berkeley Divinity School at Middletown, Conn., three years later. Entering the Episcopal ministry in 1861 he was rector at Wicasset, Maine, 1861-4, and at Warehouse Point, Conn., 1868-70. He was for six years professor of Latin at

NILES—NIMBUS

Trinity College, and in 1870 was consecrated bishop of New Hampshire.

Niles, Mich., city in Berrien County; on Saint Joseph River, and on the Michigan C., and the Cleveland, C., C. & St. L. R.R.'s; about 110 miles southwest of Lansing and 90 miles east of Chicago, Ill. Niles is in the region traversed by the earlier explorers who followed the rivers which were inlets and outlets of the Great Lakes. The French missionaries founded here a mission in 1697. On the site of the city, or nearby, was Fort Saint Joseph, the ruins of which are still in existence. In 1782 Spain claimed the land for miles around Niles on account of the capture, in 1781, of this fort by a force of Spanish soldiers. In 1828 a colony of eastern home-seekers located at Niles; in 1838 the village was incorporated, and was chartered as a city in 1859.

Niles is the commercial centre of a productive agricultural region, and its good water-power has made it a manufacturing city. The chief manufactures are windmills, flour, lumber, paper, lithographs, furniture, steel tanks, and dairy products. There is considerable trade in farm products, fruit, and the manufactured articles. The government is vested in a mayor, who holds office one year, and a council. The city owns and operates the electric-light plant and the waterworks. Pop. (1910) 5,156.

Niles, Ohio, city in Trumbull County; on the Mahoning River, and on the Baltimore & O., the Erie, and the Pennsylvania R.R.'s; about 50 miles southeast of Cleveland. It is a manufacturing centre; the chief manufactures are mine and mill supplies, galvanized iron, foundry and blast furnace products, automatic presses, boilers, electric and steam cars, chinaware, incandescent lamps, metal lath, iron roofing, sheet iron, and tin. The government is administered under a charter of 1895, and provides for a mayor, who holds office two years, and a council. The electric-light plant and waterworks are owned by the city. Pop. (1910) 8,361.

Nilgai, a large bluish-gray antelope (*Boselaphus tragocamelus*) of the plains and less forested parts of India, where it forms one of the principal game animals of the country. The short conical horns and general appearance of the head and body are somewhat ox-like; but the legs are long and slender, and a large tuft of hair depends from the chest. Nilgai both graze and browse, feed during the day, and are able to thrive with very little water. Where they are not much hunted they become so tame as to be troublesome to visitors; but when much disturbed grow shy and wary. Their chase is therefore often interesting, but the small horns make so poor a trophy that they are not often shot. The best sport is obtained by running them down on horseback and killing them by spearing. Consult works on East Indian zoology and sport, especially Kinloch, 'Large Game Shooting' (1895), and Baker, 'Wild Beasts' (1890).

Nilgiri, nīl-g'érā, or **Neilgherry**, Hills, India, a southern range of Madras, giving its name to a district, and owing to its great elevation, delightfully cool climate, much resorted to by invalided Europeans resident in India, the principal health-station being Ootacamund. The hills rise abruptly from the plains 40 miles from

the west coast, to an average height of 6,000 feet, individual peaks shooting up to 8,700 feet. The mass is isolated, with the exception that a precipitous granite ridge leaves its western face and connects with the Western Ghāts. The surface consists of grassy uplands with large groves of forest trees; but the lower slopes are heavily timbered. Coffee, tea, and cinchona are cultivated. The Nilgiris are inhabited by five distinct tribes, of whom the Todas are the most interesting. They speak a Dravidian dialect and practise polyandry. The men are tall and athletic, with Roman noses, black bushy beards and eyebrows, but they are dirty in their habits. Their sole occupation is tending cattle. The Nilgiris district has an area of 597 square miles; pop. about 115,000.

Nilometer, in hydraulics, an instrument for measuring the rise of the Nile during its periodical floods. On the island of Er-Ródah is a graduated pillar, upon which the height of the water is read off. The pillar stands in a well which communicates with the river. In the time of Pliny, a height of 12 cubits meant famine, 13 scarcity, 15 safety, and 16 plenty. At present the canals are cut and distribution commences when the river reaches 18 cubits; 19 cubits is tolerable, 20 adequate, 21 excellent, 22 abundant, and 24 ruinous. See **NILE**, THE.

Nilsson, nīl'sōn, **Christine**, Swedish operatic soprano, b. Hassaby, near Wexiö, Sweden, 3 Aug. 1843. She was educated for the operatic stage by Berwald at Stockholm, and Massé and Wartel at Paris. In 1864 she made her first appearance as Violetta in 'La Traviata' at the Theatre Lyrique, Paris; and she appeared in 1867 in that role for the first time in England at London. She sang in the United States in concert in 1870, in opera in 1871; and appeared there again in 1873-4 and 1882. She was last heard in New York on 16 April 1883. Among her most famous impersonations are Ophelia in Thomas' 'Hamlet,' and Margaret in Gounod's 'Faust'; Elvira in 'Don Giovanni' and Elsa in 'Lohengrin.' In 1872 she married M. Auguste Rouzaud, who died in 1882; and in 1886 she married Count A. de Miranda. Since 1888 she has lived in retirement. Her voice was a soprano of moderate power, but very brilliant and even.

Nimapu, nīm'a-poo. See **SANAPTIAN INDIANS**.

Nimbus, (1) in painting, the halo or collection of rays with which artists surround the heads of sacred persons, in Christian art, of Christ, and the angels and saints. The use of this ornament is both ancient and widespread, being exemplified in the Indian, Egyptian, Etruscan, Greek, and Roman religions. The ancient poets speak of their deities as being crowned with such a nimbus in their occasional appearances on earth, and in paintings this nimbus was represented in the same way as in the paintings of Roman Catholic artists. The nimbus of Christian art is usually circular in form, but sometimes it is triangular; sometimes in the form of three rays, one proceeding from the summit of the head, and the other two from the sides, so that the three form three arms of a cross. The triangular nimbus symbolizes the Trinity, it is sometimes enclosed in a circle, which symbolizes eternity. The nimbus with three rays

is also a symbol of the Trinity. Another form of the nimbus is that in which one of the common circular shape supports a cross. (2) In meteorology, the word is applied to a rain cloud; sometimes classed as if forming a primary or fundamental variety of cloud; it is really a mixture of the stratus, the cumulus, and the cirrus. It has a uniform gray tint and fringed edges.

Nimboguan, nim'a-gên. See NIMWEGEN.

Nîmes, nôm, or Nîmes, France, a southwestern city, capital of the department of Gard, 62 miles northwest of Marseilles, noted for its ancient buildings and monuments of Roman origin, which are second only to those of Rome. It is situated in a delightful plain, and handsome boulevards occupy the site of the former ramparts. The city proper is small and irregularly laid out, with narrow streets and ill-built houses; but its three suburbs, one of which, called the Cours-Neuf, is larger than the city itself, present a finer aspect, having wide, straight avenues, fine public walks, and handsome buildings. Among the edifices of the Christian era are the cathedral, begun in the 11th century, but constructed chiefly in the 16th and 17th, occupying the site of a temple of Apollo; the church of St. Paul; the new palace of justice; the general hospital; the Hôtel Dieu, rebuilt in 1830; the public library; the central house of detention, which is the citadel built by Vauban over the remains of the old Fort Roman erected in 1649 by the Calvinists; and the fine monumental fountain by Pradier, erected in 1851, on the esplanade. The public garden, where is still to be seen the fountain that furnished the Roman baths with water, and the beautiful promenade known as the Cours Feuchères, are also attractive features. Nîmes is the seat of a Roman Catholic bishop, of a Protestant consistory, and has tribunals of primary jurisdiction and commerce, a departmental academy, several learned institutions, a lyceum or college, a normal school, a theological seminary, schools of drawing, chemistry and physics, geometry and mechanics as applied to the arts, a society of medicine, a Bible society, and a museum of natural history.

The monuments of the Roman period are the Maison Carrée, so called from its rectangular form, a beautiful Christian temple nearly in the centre of the city. It stands on a stylobate, and is approached by 15 steps; the platform is 82½ feet long and 40¼ feet wide, and the building and platform together are 58½ feet high. It is surrounded by 30 columns, 10 of which are detached and form the portico. It suffered greatly during the Middle Ages, but since 1789 it has been taken care of, restored, and surrounded by an iron railing. In 1823 it was converted into a museum of paintings and antiquities. The amphitheatre, or Les Arènes, is the most perfect of its kind extant. Its height outside is from 68 to 104 feet, and its external circumference 1,174½ feet. It has from 32 to 35 ranges of seats, and was capable of accommodating from 17,000 to 23,000 spectators. It was used as a fortress by the Visigoths and the Saracens, when attacked by the Franks; during the following centuries it was also occupied as a stronghold. No fewer than 2,000 persons had established their abode within the walls of this building,

when in 1809 it was cleared by order of the prefect; and it has since been protected against encroachments. The Tour Magne (*turre magne*) is the remnant of a tower which flanked the ancient walls. The boulevards now occupy the site of the ramparts, but portions of them are still extant in the Porte d'Auguste and Porte de France, two Roman gates, the former of which is ornamented with sculptures. To these monuments must be added a ruined *nymphæum*, a fane dedicated to the nymphs, which communicated with a neighboring bath for women, the remains of which have been mistaken for those of a temple of Diana. The magnificent aqueduct, known as the Pont du Gard, is in the vicinity of Nîmes. (See GARD, PONT DU.)

In point of industry and commerce Nîmes holds a distinguished rank; it is the great southern mart for raw and manufactured silk. Its manufactures are principally silk shawls and hosiery; mixed silk, cotton, and woolen stuffs; blonde lace and tulle, galloons, ribbons, and carpets. There are several large dyeing and printing establishments, vinegar factories, and distilleries. Its trade is mostly in wine, brandies, vinegar, essences, and oil.

Nîmes is supposed to have been built by a Greek colony, and was afterward for about 500 years in the possession of the Romans. In the 16th century it became a stronghold of Calvinism, and suffered much during the civil wars. The treaty known as the Pacification of Nîmes, concluded here in 1629, granted freedom of worship to the Huguenots, but deprived them of their fortified towns. In 1815 it was the scene of religious violence, in consequence of the reaction of that period. Guizot and Daudet were natives of this town.

Nimrod's, a genus of large Tertiary fossil cats, typical of the family *Nimrodæ*, or *Machærodontæ*, which includes the various sabre-toothed tigers (q.v.).

Nimrod, according to the Moenic scriptures, the founder of the Babylonian monarchy, son of Cush. He flourished about 2450 a.c. He is styled a mighty hunter "before the Lord," a somewhat vague expression, but evidently referring to battle and conquest as well as to the chase. All that is definitely known about Nimrod is that he was a Cushite, that he established a kingdom in Shinar, the classic Babylonia, the chief towns being Babel, Erech, Accad, and Calneh, that he extended his kingdom northward along the Tigris over Assyria, where he founded a second group of capitals, Nineveh, Rehoboth, Calah, and Resen. In the Chaldean epic of the deluge Nimrod has by some scholars been identified with Gilgamesh, the heroic figure whose story is dated about 2200 a.c. Consult. 'Variorum Aids to the Bible Student' (1898).

Nimrud, nim'ood, Asiatic Turkey, the name given to a mound which is supposed to be the site of an ancient Assyrian city; on the east bank of the Tigris River at the confluence of the Tigris and the Zab Ala; and 18 miles below Mosul. It is supposed to be the city Calah, mentioned in Genesis x. 11, a suburb of Nineveh. See NINEVEH.

Nimwegen, nim'wâ-gên, or Nimeguen, nim'a-gên (ancient *Noviomagus*; Dutch, *Nijmegen*), Netherlands, city in the province of Gelderland; on the Waal, about 12 miles south of

Arnheim. Built in the form of an amphitheatre, on a series of hills, it overlooks a beautiful valley. It is in a productive agricultural region in which grain and grapes are prominent productions and much attention is given to stock-raising. The chief manufactures are leather, tin, wine, eau de cologne, flour, and cigars. It has an extensive trade in wine, grain, and cattle.

Nimwegen possesses many ruins showing its Roman origin. It was originally a Roman camp by means of which control was exercised over the Teutons living northeast of the Rhine. It was one of the Hanse towns. From 1585 for nearly 100 years it was the scene of much of the contentions, and also of the peace-makings among the Spaniards, Swedes, French, and Dutch. The "Peace of Nimwegen" in 1678-9, was the ending of the contest between the French and the Dutch, the great event in the life of Louis XIV. It marked the time when France became one of the Great Powers.

Ninde, William Xavier, American Methodist bishop: b. Cortland, N. Y., 21 June 1832; d. Detroit, Mich., 3 Jan. 1901. He was graduated from Wesleyan University, Middletown, Conn., in 1855, and was for a time engaged in teaching, receiving ordination in 1856. He was in charge of various churches in Ohio and in 1870 was transferred to the Detroit conference. He accepted the chair of practical theology at Garrett Biblical Institute, Evanston, Ill., in 1873; in 1879-84 he was president of the Institute. In 1884 he was elected bishop. He was the first president of the Epworth League.

Nindemann, Wilhelm Friedrich Carl, German-American Arctic explorer. b. Gising, Germany, 22 April 1850. He removed to the United States in 1867 and in 1881 accompanied the Polaris expedition. When the Polaris was caught in the ice he with 18 of the crew drifted on an ice-floe for seven months. They were rescued by the Tigris in 1873 and he subsequently joined the crew of the Jeannette and when the vessel was lost was despatched for aid in 1881 by Captain De Long. He assisted in the search for De Long and his companions, whose bodies were discovered the next year. He published 'Eines deutschen Matrosen Nordpolfahrt' (1885).

Nine-bark, an American shrub (*Opulastea opulifolia*), of the rose family, common throughout the eastern part of the United States. It has an ungainly form, glabrous twigs, bright green, three-lobed, crenate-lentate leaves, and small white or purplish flowers in terminal corymbs. Its bloom, remarks Mrs. Lounsberry, is not very pretty, but it redeems itself by the beauty of the ripening pods. "They, hanging in quantities at the ends of its long, curving branches, produce something the same effect as the fruit of a species of opulus or cranberry-tree. . . . The common name which would naturally recall one of the hydrangeas, is in reference to a trick of the bark in peeling not nine but many times into dilapidated-looking strips." The hydrangea (q.v.) referred to is *H. radiata*, a showy wild shrub, which is given this name by the mountaineers of the Southern States on account of the ragged peeling of its bark. Both shrubs flourish in rocky and swampy places, and both are susceptible of cultivation. Consult Lounsberry, 'Southern Wildflowers and Trees' (1901).

Nine-Pins, a game with nine pins or bottle-shaped pieces of wood set on end, at which a large wooden ball is rolled for throwing them down. See **BOWLS**; **BOWLING**.

Nine Worthies, romantic heroes grouped together in Arthurian legend, especially in the 'Triumphes des neuf Preux,' where the author describes a vision in which he saw three Jews (Joshua, David, Judas Maccabæus), three pagans (Hector, Alexander the Great, Julius Cæsar), and three Christians (Arthur, Charlemagne, Godfrey of Bouillon). These worthies, with occasionally a tenth, Bertrand du Guesclin, and with Guy of Warwick sometimes substituted for Godfrey of Bouillon, may be traced back to old Welsh legends; Brunet says the three triads are of Spanish origin; and Dunlop showed that the list appeared in an old Low German poem on Alexander. Shakespeare makes them the butt of some fooling in 'Love's Labour's Lost.'

Ninekiller. See **BUTCHER-BIRD**.

Ninety-six, Fort, a former Revolutionary fort in Abbeville County, S. C., near the Saluda River. It was so-called on account of being 96 miles from the frontier fort of Prince George.

Ninety-three ('Quatre-Vingt-Treize'), a novel by Victor Hugo, published in 1874. It bears the sub-title: 'Premier Recit. La Guerre Civile,' and was intended to form the first part of a trilogy. The edition of 1882 contains several remarkable designs signed by the author. The story deals with an episode of the Vendean and Breton insurrection.

Nineveh, nîn'ê-vê, the ancient capital of the Assyrian empire. The site of the city, which was destroyed about 606 B.C. by the Babylonians Nabopolassar and the Mede Cyaxares, has been identified with the modern Kouyunjik. It stands on the left bank of the Tigris, opposite to the town of Mosul. The first historic notice of Nineveh is in Genesis x.; it is described as "a great city" in the time of the prophet Jonah (about 865 B.C.). Ezekiel at the beginning of the 5th century B.C. speaks of its desolation in the most vivid imagery. "The Assyrian was a cedar in Lebanon, with fair branches"; "All the trees of Eden that were in the garden of God envied him"; but "strangers, the terrible of the nations, have cut him off"; "upon the mountains and in all the valleys his branches are fallen and his boughs are broken by all the rivers of the land; and all the people of the earth are gone down from his shadow and have left him." It was known to travelers that vast mounds covered the banks of the Tigris opposite Mosul and extended to a considerable distance inland. They were long considered to cover the ancient site of the Assyrian capital, but it was not until 1841 that M. Botta, the French consul at Mosul, began excavations with the result that he obtained a few fragments of brick and alabaster. He renewed his efforts at Khorsabad, 12 miles to the northeast, in 1843 and discovered an Assyrian edifice which had remained buried in the sand for thousands of years. The work was continued by Layard, who explored the lofty mounds of Nimrûd, situated 18 miles south-southeast of Mosul at the point where the tributary Zab joins the Tigris. This was the beginning of a series of the most remarkable discoveries. He immediately came upon numerous slabs covered with cuneiform inscriptions of

NINEVEH—NINIAN

unique importance. A chamber in the ancient ruins was lined with these; they were in excellent preservation. He unearthed, moreover, gigantic figures of various kinds—winged bulls and lions with human heads and winged sphinxes, which stood as guardians at the gates of stately palaces. It was evident that the old city had been destroyed by fire, for the stone images in many cases were calcined and crumbled into dust on exposure to the air. The fire had not, however, desolated what the explorer designated the northwest palace. Here he discovered in excellent preservation 28 rooms, decorated with bas-reliefs, carvings, and moldings which told the tale of the art and civilization which had flourished at Nineveh in its palmy days. Returning to Kouyunjik Layard met with even more important results from his excavations. When he pierced the mounds at this point he was enabled to explore nine vast rooms, one of them 130 feet long, and all replete with interesting and valuable sculptures, inscriptions, and carvings. In 1849, after returning to England and arousing the interest of the learned world in his magnificent discoveries, he renewed his work at Kouyunjik and found an almost inexhaustible treasury of antiquities in the sand mounds of the plain. He was now acting as agent for the British Museum, whose Assyrian collection he enriched with some of its most precious examples of art and inscriptions. Loftus and Hormuzd Rassam continued the work in 1853 and the excavations at Nimrud were renewed by George Smith in 1873. There can be no doubt that some of these monuments represent the remains of ancient Nineveh, and scholars have arrived at the conclusion that the city of Nimus occupied the site of Kouyunjik and Nebbi Yunus on the left bank of the Tigris at the confluence of the Zab. Asur, an even earlier capital of Assyria, was undoubtedly built on the site of the modern Kalah Sherghat. The palaces of Sennacherib and Assurbanipal have been unearthed from the mounds of Kouyunjik, and a second palace of Sennacherib and Esarhaddon from the mounds of Nebbi Yunus. It is concluded from these discoveries that Nineveh proper was one of a cluster of cities and royal residences that stood on the banks of the Tigris. This city was square in shape, and each of the four walls was a mile in length. The palace of Sargon at the northern angle had a facade 400 yards in width. The chief sculptures and inscriptions which are now stored in the British Museum belong to palaces and temples in the northwest of the city. The principal palace was built in the 9th century B.C. by Assurnasirpal. Near by he built a great tower, rising with narrowing stages. His son Shalmaneser II. built the central palace of the group. The statue of Nebo in the British Museum was brought from what has been called the southeast palace, but was really a temple.

Nineveh was not the earliest capital of Assyria and only came into importance in the time of Sennacherib, who is recorded on the inscribed bricks to have built its walls. From his time it was the chief seat of empire, and gave its name to the whole group of cities between the Tigris and the Zab. Hence Jonah describes this Nineveh as a city of three days' journey, and Diodorus declares its circuit was 480 stadia.

Consult the works of Layard, Botta, and

Flandin; also Oppert, 'Expédition en Mésopotamie'; Smith, 'Assyrian Discoveries.'

Nineveh, Va., Cavalry Engagement at. After the battle of Cedar Creek (q.v.) in Virginia, Gen. Sheridan on 9 Nov. 1864 withdrew his army to Kernstown, and Gen. Early followed him as far as Middletown. Sheridan ordered Torbert, commanding his cavalry, to move on Early at noon of the 12th, Merritt's and Custer's divisions to the right, on the Back and Middle roads, against Rosser, and Powell's division to the left, on the Front Royal road, against Lomax. Powell moved down the road as directed, and thence across toward Middletown, and at Nineveh met McCausland's cavalry brigade, which charged him; but he made a counter-charge and routed it, capturing two guns, three wagons, two battle-flags, and 161 prisoners, and pursuing eight or nine miles up the Luray Valley. Six regiments were engaged on either side. The Union loss was 2 killed and 15 wounded; the Confederates lost 20 killed and 35 wounded. Meanwhile the column on the right drove Rosser across Cedar Creek, and under cover of the night Early again retreated up the valley to New Market. Consult: 'Official Records,' Vol. XLIII.; Pond, 'The Shenandoah Valley in 1864.'

E. A. CARMAN.

Ningpo, ning'pó', China, a city and treaty-port in the province of Che-Kiang, in a fertile plain on the left bank of the Taisia or Ningpo River, 16 miles from its mouth, and about 100 miles south of Shanghai. It was opened to foreign trade by the Treaty of Nankin in 1842. It is surrounded by walls 5 miles in circuit, 25 feet high, and 15 feet wide at top, and, besides, has extensive suburbs outside. Though highly extolled by the Chinese as one of the most beautiful cities of the Celestial Empire, it consists of narrow filthy streets and one-storied houses, sometimes of stone, but mostly of brick. Its most remarkable edifice is a brick tower, formed of seven stories, and above 160 feet high, but now a mere ruin, and it contains numerous temples, colleges, etc., chief among them the temple of the Queen of Heaven, founded in the 12th century, but the present building, elaborately and richly ornamented, dates from 1680. Shops and immense storehouses occupy the quarters near the river, while eating-houses and tea shops abound near the gates and in the suburbs. A medical hospital, opened by a missionary society in 1843, has been found very beneficial. The manufactures consist chiefly of silk and cotton goods, carpets, furniture, etc. The native trade is very extensive. The principal exports are tea, silk, and raw cotton, and the principal imports, besides manufactured goods, sugar and opium. The average value of the trade of Ningpo for 10 years past has been about \$11,400,000. The great bulk of the trade is carried on with the other treaty ports. Ningpo was taken by the British without resistance in 1841. Pop. estimated at 260,000.

Ninian, nín-i-an, Saint, the apostle of the southern Picts. He labored in evangelizing northern England and southern Scotland at the end of the 4th and the beginning of the 5th centuries. He was a Briton by birth, but had been thoroughly educated in language and philosophy at Rome. The field of his activity extended as far north as

the Gramplan Hills, and his see was Candida Cass, Whithorn, the modern Wigtonshire, the southwestern county of Scotland. His death is placed by hagiologists in 432 and his festival is 16 September. The only church building which he is recorded to have founded is dedicated to St. Martin of Tours.

Nin'igret, an American Indian sachem of the Niantics, one of the Algonquin tribes. In 1637 he assisted the colonists in the Pequot war. In 1667 he sold much of his land on Long Island to the colonists. He died in 1677.

Niño, Pedro Alonso, pá'drō ā-lōn'āō nē'āō, Spanish navigator: b. Moguer, Spain, about 1455; d. about 1505. He accompanied Columbus on his third voyage in 1498 to Trinidad and the coast of Paria, and returned to Spain filled with the project of making an expedition to the new country in search of treasure. He was granted the royal permission, one fifth of the spoils to be the share of the Crown. The voyage was a successful one; he peaceably obtained from the Indians a great store of treasure, but was accused of withholding the share belonging to the king and died before the suit was ended.

Ninon de l'Enclos, nē-nōh dé lōn-klē, or **Lenclos**. See **LENCLOS, ANNE**.

Ninus, nī'nūs, eponymous king of Nineveh and founder of that city. His name is nowhere mentioned, apparently, in Assyrian monuments, and the story that he extended the Assyrian empire to India and to Egypt is historically false. But he figures largely in Greek myth and "history," where Nineveh is said to have been founded by him and named for him; he married Semiramis, wife of Onnes, but his wife murdered him, and ruled as regent for her son Ninias, who is as mythical a personage as his father. For Semiramis alone in these stories does history show any actual existence.

Niobe, nī'ō-bē, in Greek mythology, the daughter of Tantalus, was the wife of Amphion, who, in common with Zethus, governed Thebes, which they had built. According to the common accounts she had seven sons and seven daughters, and, proud of her blooming offspring, she so far forgot herself as to exalt herself above Latona, the mother of only two children — Apollo and Artemis; and in punishment of her presumption she had to witness the destruction of her children by the arrows of the twin deities. Anguish and despair transformed the wretched mother, after long wanderings, into a stone. Amphion and Zethus also fell, pierced by the arrows of Apollo, when, full of wrath, they penetrated into the sanctuary of the god. This is the most common account of the fate of Niobe, in the circumstances of which poets frequently differ, who have taken this story for a subject as often as artists. The origin of the fable seems to lie in the ancient figure of speech by which it was said of young people who died suddenly that they had been struck with the arrows of Apollo or Artemis; and in almost all languages, petrification is the natural image of the highest degree of torpid despair.

Niobe of Nations, **The**, a name applied to Rome, the "lone mother of dead empires."

Niobium, in chemistry, a metallic element discovered in 1801 by Hatchett, but more fully investigated by Rose, who named it. Niobium

is present in columbite, euxenite, pyrochlore, and in other minerals. The metal may be prepared from the fluoride of niobium by heating it in a covered crucible with sodium, and dissolving out the soluble salts with water. It is insoluble in nitric acid, difficultly soluble in hydrochloric acid, but dissolves in hot hydrofluoric acid. It forms two oxides of a chlorous character, uniting with basylous oxides to form salts.

Niobrara, nī-ō-brā'ra, a river which has its rise in Laramie County, Wyo., and which flows east into Nebraska, crosses the northern part of the State, making regular, long north and south curves, and flows into the Missouri River at Niobrara in Knox County. It is about 460 miles long, flows rapidly in the upper part of its course, but moves slowly through the almost level prairie country of the northern part of Nebraska.

Niobrara Stage, in geology, a subdivision of the upper Cretaceous division, forming with the Benton stage the Colorado Epoch. It occurs in Kansas and South Dakota as well as in Colorado and further West, has a maximum thickness of 2000 feet, and includes chalk, calcareous marls, shales, sandstones, and limestones.

Nī'pa, an East Indian palm (*Nipa fruticans*) of the order *Palmae* and the only species of its genus. It is a low-growing tree with creeping, smooth stems, and large clusters of fruit. Its abundant sap is used for sugar- and wine-making and its feathery leaves for thatching or roofing. These leaves are often 20 feet long and form the principal material for house-building in the farms and villages of the Philippines and East Indies generally. It abounds in the salt marshes, and like the mangrove (q.v.) with which it is commonly associated, it is an important land-builder.

Nīpal, nē-pāl'. See **NEPAL**.

Nīph'er, Francis Eugene, American physicist and electrical engineer: b. Port Byron, N. Y., 10 Dec. 1847. He was graduated from the Iowa State University in 1870, and became instructor there. He afterward went to Washington University as professor of physics and electrical engineering. In 1877 he organized the weather service of Missouri and in 1878 the Magnetic Survey. In 1889 he showed that positive photographic pictures could be developed in the full glare of sunlight instead of in a dark-room; and he also made the discovery that a photographic plate over-exposed could be developed as a positive and that a zero point exists between the negative and the positive which cannot be developed at all. He wrote: "Theory of Magnetic Measurements" (1886); "Electricity and Magnetism" (1895); "Introduction to Geographical Algebra" (1898). He has also contributed scientific articles to the "Transactions" of the St. Louis Academy of Science, of which he is a member.

Nīphon, nīf-ōn', **Nippon**, **Nipon**, or **Nihon**, the various Japanese pronunciations of Jih-pen (whence Japan), signifying sun-origin, the Chinese name for the island empire, and locally adopted by Japan in the 7th century. Nippon was long used by foreigners to designate the principal island Hondo. See **JAPAN**.

Nīp'igon, a lake in Canada. See **NANICUON**.

Nipissing, nip'-sīng, or **Nepissing**, Lake, in Ontario, Canada, lies at an altitude of 600 feet above sea-level, northeast of Georgian Bay, Lake Huron, with which it communicates by French River. It is irregular in coast-line, is 48 miles long, and has a maximum breadth of about 30 miles. Its chief feeder is Sturgeon River, draining from the north a group of smaller lakes. The lake contains numerous islands, one of which is an Indian reservation. The Canadian Pacific railroad skirts the northern shore, and has stations at North Bay, and Nipissing Junction, on the lake shore. Steamers ply on the lake and the region has become a favorite sporting and hunting ground.

Nipissing Indians, an American tribe of the Algonquian family residing on the shores of Lake Nipissing, in northern Ontario, Canada. In the 17th century they were one of the most important tribes of British America and were regarded by the Jesuit missionaries as the typical Algonquians. A few survivors remain in the vicinity of Montreal.

Nip'muc Indians, or "fresh water people," an American tribe residing in colonial days in Massachusetts. The majority of the Nipmucs did not at first join with Philip in his war against the colonists, but were active against the English during the struggle in Connecticut in 1675. In January 1676 the remnant of Philip's tribe, with the Narragansetts, the Quaboag, and River Indians, effected a junction with the Nipmucs. On the overthrow of Philip the Nipmucs fled to Canada.

Nipper, Susan, in Dickens' 'Dombey and Son,' a young maid, nurse to Florence Dombey. She marries Toots. The sharpness of tongue whereby she justifies her name is offset by fidelity to her charge.

Nipperday, nip'-dē, Karl Ludwig, German philologist; b. Schwerin, Germany, 13 Sept. 1831; d. Jena, Germany, 2 Jan. 1875. He was educated at the universities of Berlin and Leipzig and in 1852 accepted a professorship at Jena. He made translations of Caesar, Nepos, Tacitus, etc., with critical notes, which have been widely used. See Schöll's biography (1875), and his collection of his works, 'C. Nipperdei Opera' (1877).

Nippur, nip'-poor', Asiatic Turkey, an ancient city of Babylonia, between the Tigris and Euphrates, 120 miles southeast of Bagdad. Its site now marked by the numerous mounds and excavated ruins at Nuffar. Nippur was a great and flourishing city 4000 a.c., and the tablets of its great library discovered since 1888 antedate Abraham's departure from Ur of the Chaldees for the Promised Land. Nippur is identified with the Calneh of Genesis x. 10, and was the most northerly and easterly of the four conspicuous centres of Babylonian civilization and religion, literature and science. It was the seat of the worship of Bel, or the sun, the angry En-Lil, or Lord of the Storm, the cause of all the weather troubles of mankind, and the original conception of a god of anger and a religion of fear.

Nippur was overthrown and its buildings mined by the Elamite hordes under Kudur-Nankhundi, 2285 a.c., who destroyed nearly every city of Babylonia. Favored by the permission and protection of the Sultan and his administration,

the University of Pennsylvania has since 1888 excavated and laid bare many of its important ruins. The work was supervised first by Dr. John Punnett Peters, and latterly by Dr. J. H. Haynes and Professor H. V. Hilprecht. Considerable attention was paid to the excavation of the great temple of Bel, the foundation of which was laid between 6000 and 7000 years before Christ. An ancient government palace of immense proportions, where the kings lived, belonging to the fifth millennium before Christ, and one of the ancient gates and walls of the city, were uncovered. A government palace erected about 3000 a.c. was completely and systematically excavated, besides numerous other buildings of less importance. Most valuable inscriptions in stone belonging to the earliest rulers of Babylonia, by the help of which the early history of mankind in the valley between the Tigris and Euphrates will be reconstructed, were discovered. Antiquities in coins, jewelry in gold, silver, and bronze in great quantities; vases in enameled and plain pottery of all periods; seals and seal cylinders, such as the Babylonians used in connection with their business transactions; images of gods, playthings in terra-cotta, bas-reliefs, weights, utensils in bronze, iron, and silver, etc., were also found. These were a few of the important relics recovered, without mentioning the numerous facts ascertained and the many questions solved through study in the trenches, which have important bearing upon the religious ideas and customs of the daily life of the Babylonians. But chief of the important discoveries made during 1889-1900 were those in connection with the famous library of the sanctuary, which was found beneath 25 feet of accumulated debris, representing several millenniums of history. In the uppermost stratum of this mound the excavators found coffins which had been buried in the early centuries of our Christian era. A great many antiquities were also gathered which belonged to the Jews who continued to live at Nippur after the return of Ezra and Nehemiah. Prominent among them were terra-cotta bowls containing incantations and charms inscribed in Hebrew and Mandæan. At a depth of 25 feet were found a series of rooms, a number of which contained ledges or shelves built out from the wall, for the purpose of laying out the tablets in rows. The library seems to have been divided into two parts. There was a business section for keeping accounts, and the educational quarters, with a vast library of a literary character.

Nearly 30,000 tablets were recovered, illustrating practically every branch of literature known to the Babylonians. Among the inscriptions are hundreds of historical texts, dictionaries, or lists of Sumerian words with Semitic equivalents; lists of birds, animals, plants, and stones; lists of words for chairs, stools and other articles of furniture; hymns, astronomical and mythological inscriptions, tablets which refer to the service and functionaries of the temple—how many garments the god Bel wore, how many temples and shrines there were at Nippur besides those dedicated to Bel, and what the revenues of the temples were; tablets containing grammatical sentences written by students, arithmetical calculations, etc.

In appreciation of Professor Hilprecht's valuable services, the Sultan presented him with

among other important antiquities, the larger part of the find of the library, which is now deposited in the University of Pennsylvania, and is undergoing systematic decipherment.

Only a small portion of the mounds at Nippur has thus far been completely excavated. Considerable work yet remains to be done on the temple. Only one side of the ancient government palace has been cleared, and about one twentieth part of the library, but arrangements have been effected for a continuance of the work of excavation until completed. See ASSYRIA; BABYLONIA, and illustrations Vol. II. Consult: Hilprecht, 'Old Babylonian Inscriptions, Chiefly from Nippur' (1893-6) and 'Explorations in Bible Lands During the Nineteenth Century' (1903); Peters, 'Nippur, or Explorations and Adventures on the Euphrates' (1897).

Nirukta, nī-rook'tā. See VEDA.

Nirvana, nīr-vā'na, a term which originally denotes the blowing out or extinction of a flame, and is used in the metaphorical language of Buddhist philosophy to mean that condition which succeeds to the long process of metempsychosis to which imperfect souls are subjected before they reach the end of Karma, the active life of earthly effort and struggle after perfection. Nirvana, according to Rhys Davids, was originally intended by Buddha to indicate extinction of existence, annihilation, as an escape from the perturbations of passion, and the miseries of life. The utterly negative character of this conception seems later on to have undergone a change. Buddha has said "it is enough to know that Nirvana is an advance beyond life; it is a condition of fearless security and happiness." But there is no definite implication that this happiness is conscious, or that a sense of personal identity accompanies it. Annihilation may be quite consistent with "Freedom from the pang of earthly existence" and even prove "a region or condition of peace." This peace in Nirvana results from the fact that no transmigration into baser forms of wretched ghost, beast, or demon is possible for the enfranchised spirit. The "extinction" in this case will only mean the extinction of the baser elements in the individual. The great and pure elements are developed in inverse ratio: there follows a calm and sinless state of mind, such as even Lucretius sometimes caught sight of when he speaks of "vita dis digna" as the object of the philosopher. "The life worthy of Gods,"—holiness, purity, freedom, wisdom, this is nirvana in the true Buddhist sense, though, when and where it is to be realized is left one of the misty problems of oriental mysticism. Consult: Müller, 'Die Bedeutung von Nirvana'; Rhys Davids, 'History and Literature of Buddhism'; Oby, 'Du Nirvana Bouddhique'; Johnson, 'Oriental Religions: India.' See BUDDHA; BRAHMANISM; HINDUISM; JAINA.

Nisami, nī-sā-mē'. See NIZAMI.

Nisan, nī'sān, in the Jewish calendar, the first month of the sacred year and seventh of the civil year, answering nearly to our March. See CALENDAR.

Nisard, Jean Marie Napoléon Désiré, zhōn mā-ré nā-pō-lā-ōn dā-zē-rā nē-zār, French author: b. Châtillon-sur-Seine 20 March 1806; d. San Remo, Italy, 25 March 1888. He became professor of eloquence at the Collège de

France, Paris, in 1843; in 1855 director of the Ecole Normale Supérieure, and in 1867 a senator. In 1850 he was elected to the Academy. His reputation as a historian of literature was established by his 'Etudes de Mœurs et de Critique sur les Poètes latins de la Décadence' (1834). Others of his works are: An excellent 'Histoire de la Littérature française' (1844-9); 'Mélanges d'Histoire et de Littérature' (1859); the distinguished study, 'Les quatre grands Historiens latins' (1847); and 'Nouveaux Mélanges' (1886).

Nisbet, nīz'bēt, Huma, Scottish artist and novelist: b. Stirling, Scotland, 8 Aug. 1849. Leaving Scotland at 16 he spent six years in Australian travel and on his return was for eight years prior to 1885 art master in Watt College, Edinburgh. He has since twice revisited Australia and has published 45 romances, including 'Bail Up'; several volumes of verse, and various works on art, such as 'Where Art Begins,' and also of travel, such as 'A Colonial Tramp.'

Nisbet, John, Scottish forester: b. Edinburgh 2 Oct. 1853. He was educated at Edinburgh University, where he is now examiner in forestry, and also studied at Munich. Entering the Indian forest service in 1875 he became conservator of forests, Burma, in 1895, retiring in 1900. He has published 'British Forest Trees' (1893); 'Studies in Forestry' (1894); 'Our Forests and Woodlands' (1900); 'The Management of Forests in Theory and Practice' (1901); 'Burma under British Rule, and Before' (1901).

Nisbet, Robert Buchan, Scottish painter: b. Edinburgh 1 July 1857. He was educated at the Edinburgh Institution and chose as his profession that of landscape painter in water colors. His success was attested by the awards made to him at three international exhibitions—Dresden (diploma) 1892; Antwerp (medal) 1894; Vienna (medal) 1898. Among his most notable works are: 'Evening Stillness' (purchased by the Chantrey Bequest) 1890; 'Thunder Weather'; 'Harrowing'; 'Waiting for the Tide' (1898); 'Between Showers' (1898).

Nish, nēsh, or Nisaa, nēs'sa, Serbia, a fortified city on the Nishava, a tributary of the Morava, 130 miles southeast of Belgrade. It has Turkish and Serbian sections, but as an increasing commercial and railway centre is rapidly becoming modernized. It was the seat of the National Assembly until 1901, and is the see of a Greek bishop. It has hot springs and baths, celebrated since the Roman era, when Nish is mentioned as Naissus by Ptolemy. Constantine the Great was born at Nish. Situated at the junction of many of the main highways of the Balkan Peninsula it has had a turbulent history, in 1456 being captured by the Turks; in 1878 it was taken by the Serbians under King Milan. The unsuccessful attack in 1809 is still perpetuated by the "Tyke-Kouls" (Tower of Skulls), erected by the Turks half a mile east of Nish, and consisting of the heads of Servians killed during the battle.

Nishan el-Aaman, nī-shān' ēl ā-mān' (Ar. *Nishan al-aman*, order of the best), Tunisian order of honor founded by Mohammed-es-Sadok in 1859. It commemorates the adoption of the constitution and has but one degree.

Nishan el-Iftikhar, *el-if-ti-kâr*, a Tunisian order of merit, the data concerning which is not complete, but of which several medals were distributed by the bey on his visit to France in 1846. The degree seems to be indicated by the pecuniary value of the medal.

Nishan el-Iftikhar, Turkish order founded by Sultan Selim III. and revived in 1827. It is conferred upon foreigners who have rendered services to the Turkish state. There are no classes of honor, but the value of the medal differs with the degree of the recipient.

Nishan i-Imtia, *em-tê-âs'*, Turkish order of merit founded in 1879 by Sultan Abdul Hamid. It is conferred upon Turkish officials who have displayed at least three of the attributes: patriotism, fidelity, bravery, and zeal, these names being engraved on the medal.

Nishan i-Shefkat, *ê-shêf-kât'* (Ar.-Pers. *Nishan-i-shifqat*, order of clemency), Turkish order of three degrees established by Sultan Abdul Hamid in 1878. The medal is conferred upon women who have rendered aid to their country in times of war or peril.

Nishapur, *nish-â-poor'*, Persia, the capital of a province of Khorasan, situated in a fertile plain at an altitude of 3,900 feet, 50 miles west of Meshed. Anciently it was of great commercial and political importance. An active domestic trade is still carried on, and the city has long been celebrated for the quality of the turquoises found in the district. Omar Khayyam was born here in 1123, and his unpretentious tomb is shown in a mosque among the ruins of the old town. Pop. (est.) 15,000.

Nish'gar. See NASS INDIANS.

Nisibis, *nîs'i-bîs*, Asia Minor, anciently an important town, the capital of Mygdonia, Mesopotamia, now the town of Nisibin, in the vilayet of Diarbekir (pop. 10,000). The cuneiform inscriptions found here refer to it as Nasibina. It was frequently taken and retaken in the wars between the Romans and the Parthians, and afterward between the Romans and Persians, until it was given up to the latter by the Emperor Julian in 363. The Persians were defeated here by Belisarius in 541, and by Marcian in 573.

Nisqualli (*nîz'kwâ-lê*) Indians, an American tribe of the Salishan family formerly residing on Puget Sound, Washington. They joined the Puyallup and other tribes in signing the Medicine Creek Treaty of 1854. In 1858, the Nisquallis took part in the general Indian war in the Northwest. There are to-day less than 100 survivors of the tribe.

Nisroch, *nîs'rôk*, in Assyrian mythology, a god, in whose temple, and in the very act of idolatry, Sennacherib was slain by his own sons (2 Kings xix. 37). The name signifies "the great eagle"; and the earlier Assyrian sculptures exhumed at Nineveh have many representations of an idol in human form, but with the head of an eagle. Among the ancient Arabs, also, the eagle occurs as an idol. Historians have, however, long accepted Joseph Halévy's conjecture that the word is a corruption of Nusku; while it has also been held to be identical with Marduk of the later Babylonian pantheon.

Nissa, *nê's-sa*, Servia. See NISZ.

Nissen, Heinrich, *hin'rîn nîs'sên*, German archaeologist: b. Habersleben, Germany, 3 April 1839. He was educated in Kiel and Berlin, and in 1869-76 was professor in Marburg and subsequently held professorships in Göttingen, Strasburg, and Bonn. He wrote: 'Kritische Untersuchungen über die Quellen der 4. und 5. Decade des Livius' (1863); 'Italische Landeskunde' (1883); 'Griechische und Römische Metrologie' (1887); etc.

Nissus, *nî'ssûs*, Greek mythological king of Megara. His life depended upon a lock of gold or purple hair and of this his daughter Scylla deprived him when Minos, her lover, laid siege to Megara. This act of treachery enabled Minos to take the city, but shocked by the conduct of Scylla, he had her tied to the stern of his ship and by some accounts she was drowned in the Saronic Gulf. Another legend makes her swim after Minos' ship and she is then pounced upon by her father in the form of a sea-eagle, whereupon she changes into the sea-bird Ciria, and is ever after pursued by him.

Nithard, *nê-târ'*, Frankish historian: b. about 795 A.D.; d. near Angoulême 15 May 843. He was a grandson of Charlemagne. He was in the service of Louis the Pious, and later of Charles the Bald, whose cause he espoused during the dissensions between the sons of Louis. He fought in the battle of Fontenay, and was killed in a battle against the Northmen. At the command of Charles the Bald, he wrote a history of the times 'De dissensionibus filiorum Ludovici Pi ad annum usque 843,' which though naturally partisan, is a valuable source for the study of early mediæval history. It is contained in the 'Monumenta Germanie Historica,' published by Pertz (1870); and was also published by Holder (1882), and in German by Jasmund (1889).

Nithsdale, *nîths'dâl*, William Maxwell, 5th EARL OF, Scottish Jacobite: b. Scotland 1676; d. Rome, Italy, 20 March 1744. He joined the Jacobites in 1715 and served under Forster and Derwentwater at Preston where he was captured. He was imprisoned in the Tower and sentenced to death, but assisted by his wife he made his escape in woman's clothing the night preceding the day set for his execution, though had they known it he had been reprieved. They then went to Rome where Nithsdale joined the followers of the Pretender. He was the "Willie" of 'Kenmore's up and awa'; and the story of his escape written by his countess will be found in 'Transactions of the Societies of Antiquaries of Scotland,' Vol. I.

Nitocris, *nî-tô'krîs*, Egyptian queen, the last of the Sixth Dynasty. She succeeded her brother Mentuophis, whose assassination she avenged by drowning all who had any complicity in it. She was buried in the third in size of the greater pyramids, which she had enlarged. She was supposed by the Greek historians to be Rhodopis, "rosy-cheeked," a Greek courtesan, with whom the king fell in love from the sight of her lost slipper.

Nitrate of Silver, a compound of silver and nitric acid, having the formula $AgNO_3$. It may be prepared by dissolving pure silver in warm nitric acid that has been diluted with two or three times its own weight of water. The solution is evaporated to dryness, and the resi-

Be gently heated until all the nitric acid has been expelled, after which it is dissolved in water and crystallized; the silver nitrate being then obtained in the form of white tabular crystals belonging to the trimetric system. Nitrate of silver is readily soluble in water and in alcohol. It melts at 424°F , and when cast into sticks it constitutes lunar caustic, being used in this form as a cauterizing agent. Its cauterizing effect depends upon the fact that it forms, with the albumen of the flesh, an insoluble albuminate of silver. Nitrate of silver, especially in the presence of organic matter, is blackened by exposure to light, and on account of this property it is used in the preparation of indelible inks for marking linen, and as a basis for dyes to color the hair black. It was much used in photography in the days of the old "wet-plate" process, and is still employed in sensitizing the paper upon which the positive pictures are printed. The black stains that it leaves upon the hands may often be removed by the application of cyanide of potassium; but it should be remembered that cyanide of potassium is a violent poison, and that it must be used with extreme care.

Medical Uses.—Nitrate of silver is official in two forms, the heavy crystalline salt, readily soluble in its own weight of water, and the lunar caustic above mentioned. Applied to the skin, it produces a brownish-black stain due to the formation of oxide of silver. The crystals only are used internally either in pills or solutions. Nitrate of silver as ordinarily applied to an inflamed mucous membrane is more of an astringent than of an irritant. Applied locally as a caustic, its action is superficial, coagulating the albumen and so forming a protective coating. Internally it is used (combined with an anodyne) in gastric ulcer, gastritis, intestinal ulcerations and dysentery. Salt and soap checks its action. Externally in stick form, it has been used to prevent the pitting of smallpox. In solution it is employed to quiet the pain and relieve swelling in cases of felon, orchitis, and epididymitis; in inflammation of the mouth, pharynx, and larynx; in whooping cough, pruritus ani, bed-sores, boils, granular lids, conjunctivitis, etc. Nitrate of silver should not be used internally for too long a time, as it is slowly eliminated from the body. Argyria or chronic poisoning is liable to result from such use of the remedy. See SILVER-POISONING.

Nitrate of Soda, Sodium Nitrate, or Chile Salt-peter, a compound of sodium and nitric acid, having the formula NaNO_3 . It may be prepared by neutralizing nitric acid with sodium hydrate or sodium carbonate, and evaporating the solution; but it occurs native and in large quantities, in the northern part of Chile, and in the neighboring parts of Peru and Bolivia. Deposits of it are also known in Humboldt County, Nev., and in San Bernardino County, Cal. The Chilean deposits occur at a height of 3,300 feet above the sea, but they are undoubtedly of marine origin, since they contain the remains of recent shells. Nitrate of soda, as it occurs in nature, may be purified by repeated crystallization from its aqueous solution. It crystallizes in rhombohedral forms, and is isomorphous with calcite; but in nature it is usually found massive, or in beds, or as an incrustation. The crude sub-

stance is valuable as a fertilizer (see MANURES AND MANURING), and it is also used extensively as a source of nitric acid and of nitre (qq.v.).

Nitrates, salts of nitric acid. See NITRATE OF SILVER; NITRATE OF SODA; NITRE; NITRIC ACID.

Nitre, nîtré, Niter, Nitrate of Potash, Potassium Nitrate, or Salt-peter, a compound of nitric acid and potassium, having the formula KNO_3 . It occurs native in many places as an incrustation upon the soil, notably in Spain, Egypt, Persia, and India. It also occurs in considerable quantities in the caverns of Kentucky and Tennessee, and elsewhere along the Mississippi Valley. It is obtained on a commercial scale from these various sources, but it is also prepared in vast amounts from native nitrate of soda (q.v.). When hot concentrated solutions of nitrate of soda and potassium chloride are mixed, nitrate of potash and chloride of sodium (common salt) are formed, the latter separating out in the form of crystals when the solution cools, while the nitrate of potash remains in solution. Nitre has mild antiseptic properties, and it is also used in dyeing, in metallurgy, in medicine (as a diuretic and diaphoretic), and in the preparation of fluxes. It is used in the arts most commonly, however, in the manufacture of gunpowder (q.v.). For "sweet spirits of nitre" see NITROUS ETHER.

Nitric Acid (Latin, "from nitre"), in chemistry, a compound of nitrogen, oxygen and hydrogen, having the formula HNO_3 , and possessing strongly acid properties. It appears to have been discovered in the 9th century, by Geber, the "father of chemistry," who describes a method of preparing it by distilling a mixture of nitre, alum and copperas (sulphate of iron). The modern method of preparing it by the action of free sulphuric acid upon nitre was apparently first described by Glauber, about the middle of the 17th century. Lavoisier proved that the acid contains oxygen, and Cavendish, in 1785, succeeded in preparing nitre by passing electric sparks through a mixture of oxygen and nitrogen, in the presence of a solution of caustic potash. Free nitric acid occurs in rain-water in exceedingly small amounts, and its salts are formed, in the soil, by the bacterial oxidation of nitrogenous organic matter. (See NITRIFICATION.) Commercially, nitric acid is manufactured by distilling sodium nitrate ("Chile salt-petre") with strong sulphuric acid. The sulphuric acid (H_2SO_4) unites with the sodium nitrate (NaNO_3) to form nitric acid (HNO_3) and acid sulphate of sodium (HNaSO_4), as indicated by the equation: $\text{NaNO}_3 + \text{H}_2\text{SO}_4 = \text{HNO}_3 + \text{HNaSO}_4$. When the temperature is sufficiently raised, the acid sulphate of sodium combines with another molecule of the sodium nitrate to form normal sodium sulphate (Na_2SO_4), another molecule of nitric acid being liberated at the same time, as indicated by the equation:

The temperature is not always carried to the point where this last reaction occurs, however, because although the yield is larger, the product is more largely contaminated with objectionable impurities, and the residual "cylinder cake," or "nitre cake," left in the retorts, is harder to remove. The distillation is commonly carried

out in iron retorts, iron not being seriously attacked by concentrated sulphuric or nitric acids. The nitric acid which distils off is washed by passing it through a series of double-necked iron bottles ("Woulfe's bottles"), containing, each, a small quantity of water. The distillate is finally condensed, then constituting the crude, fuming acid. Nitric acid, as thus manufactured, is yellowish in color, and contains, as its principal impurities, chlorine, hydrochloric acid, iodic acid, peroxid of nitrogen, sulphuric acid, sodium sulphate, and iron compounds; some of these being distilled over, and others carried over mechanically. Most of the impurities may be removed by re-distillation. A third distillation then follows, after the addition of an equal volume of concentrated sulphuric acid to retain the major part of the water. By this means a tolerably pure nitric acid can be had, though it is still yellowish from the presence of lower oxides of nitrogen. These may be removed by warming the acid slightly, and passing through it a stream of air, or (preferably) of carbon dioxide gas. Any nitrous acid that may be present may be removed by distillation with a small quantity of urea, which decomposes the nitrous acid with liberation of carbon dioxide, water, and free nitrogen.

Nitric acid, perfectly free from water, has not yet been prepared, although specimens have been obtained containing from 99.5 to 99.8 per cent of HNO_3 . When free from all impurities except water, nitric acid is a colorless liquid, which gradually decomposes in a strong light, with evolution of oxygen, water, and nitrogen peroxid (NO_2), becoming yellow from the presence of the peroxid. The most highly concentrated acid freezes at about 50°F . below zero, and boils at about 187°F ., although it begins, below the boiling temperature, to decompose into nitrogen peroxid, water, and free oxygen. Concentrated nitric acid may have a specific gravity as high as 1.552. Nitric acid was formerly known as "spirit of nitre," and (when diluted) also as "aqua fortis" (that is, "strong water"). It is an active oxidizing agent, especially when warmed, owing to the facility with which it parts with oxygen. When mixed with hydrochloric acid, it is known as "nitrohydrochloric acid," "nitromuriatic acid," or "aqua regia," the latter name being given on account of the power that the mixture has of dissolving gold. The powerful solvent action of nitrohydrochloric acid is due to the fact that it contains free chlorine gas, liberated from the hydrochloric acid by the oxidizing action of the nitric acid upon the hydrogen of the hydrochloric acid. Nitric acid and nitrohydrochloric acid are both used in medicine, in a highly dilute state, as appetizers and diuretics.

Nitric acid is used in large quantities in chemical industries of all kinds. It is of the greatest importance in the manufacture of the coal-tar colors, and of many of the modern high-power explosives. (See, for example, *NITROCELLULOSE* and *GUNCOTTON*.) With the metallic bases it forms a series of exceedingly important salts known as "nitrates." Practically all of the nitrates are crystalline and readily soluble, and they are characterized by marked decrepitation when heated upon charcoal before the blowpipe. Several of the nitrates are used in dyeing, notably those of aluminum, iron,

and lead. Aluminum nitrate, $\text{Al}(\text{NO}_3)_3$, may be prepared by dissolving aluminum hydrate in dilute nitric acid, and crystallizing by evaporation. It crystallizes in rhombic prisms which contain nine molecules of water, are readily soluble, and melt at 99°F . Ferrous nitrate, $\text{Fe}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$, is prepared by dissolving ferrous sulphide in dilute nitric acid, and slowly evaporating the solution at as low a temperature as possible. Ferric nitrate, $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$, crystallizes in rhombic prisms, and may be prepared by dissolving metallic iron in nitric acid, adding more acid, and finally cooling the solution. It is readily soluble in water, but nearly insoluble in cold dilute nitric acid. Normal lead nitrate, $\text{Pb}(\text{NO}_3)_2$, may be obtained in the form of octahedral crystals, by evaporating a solution of lead carbonate in dilute nitric acid. The nitrates of barium and strontium are used to a large extent in pyrotechny, on account of the beautiful colors that they yield. They may be prepared by adding, to the corresponding carbonates, not quite enough dilute nitric acid to decompose the whole of the salt, and subsequently filtering and crystallizing. See also *NITRATE OF SILVER*; *NITRATE OF SODA*; *NITRE*.

A. D. RISTERN.

Nitrides, in chemistry, compounds consisting of nitrogen and one other element. They are usually prepared by the action of ammonia upon metallic oxides or chlorides, but in some cases they may be prepared by the direct combination of free nitrogen with the other constituent. Nitride of boron ("azhogen"), for example, has the formula BN , and is formed when boron is heated in nitrogen gas. Magnesium nitride, a crystalline substance having the formula Mg_3N_2 , is also formed when metallic magnesium is heated to redness in an atmosphere of nitrogen. Ramsay, Raleigh, Travers, and others, took advantage of this latter fact for effecting the absorption of the nitrogen of the air, in their researches upon argon, helium, and the other rare gaseous elements of the atmosphere. (See *ARGON*.) The nitrides of the metals are mostly decomposed by heat, and sometimes with explosive violence. Magnesium nitride, however, is quite stable.

Nitrification, the process by which nitrates are formed, either in the soil or elsewhere, by the putrefactive or fermentive decay of nitrogenous organic matter, or by the oxidation of nitrogen itself. It has long been known that nitrates are formed in the soil, and in India, as well as in Spain and certain other parts of Europe, nitrate of potassium ("nitre") is still manufactured to some extent by mixing porous soil with manure and other organic refuse, adding wood ashes (as a source of potassium), and allowing the mass to stand in heaps for two years or so. Under suitable conditions of temperature and moisture, the yield may be as much as ten pounds of crude nitre per ton of earth. Analogous changes go on, from year to year, in all fertile soil, and it was formerly believed that the natural conversion of nitrogenous matter into nitrates is due to the fact that the soil, by a sort of capillary action, condenses air within its pores; oxidation being thereby promoted because the air held by the soil, being denser than normal atmospheric air, contains more oxygen per unit of volume.

NITRILE — NITRO-COMPOUNDS

In 1866, however, Pasteur suggested that nitrification is effected through the agency of bacteria, or other forms of microscopic life; and in 1877 Schlosing and Müntz established this view upon a firm foundation, by means of many ingenious experiments. It has also been further and most convincingly established by Warington, Munro, Winogradsky, P. F. Frankland, G. C. Frankland, and others. It has been shown, for example, that nitrification is arrested by powerful antiseptics, and that it proceeds most actively at about 100° F., and less rapidly both at higher and at lower temperatures. Furthermore, if soil or sewage be raised in temperature to 212° F., so as to destroy all life that may be present, nitrification at once stops, and it will not proceed again when the temperature is restored to 100° F., even in the presence of abundance of air that has been passed through germ-proof filters. If the sterilized mass be "sown" with the nitrifying agents, however, by the addition of a small quantity of unsterilized soil or sewage, nitrification is at once resumed, and thereafter proceeds normally. Certain conditions are essential to active nitrification, in addition to a suitable temperature, the free access of oxygen, and the actual presence of a sufficient number of the live and active organisms. It is essential, for example, that the soil or other medium in which the nitrification occurs shall be slightly alkaline, and this implies the presence of a base such as potash or carbonate of lime, in sufficient quantity to fix the nitric acid as it is formed; for if no such base is present, the medium soon becomes acid, so that the organisms cease their activities. It is usually held that some quantity of organic carbon must also be present, in order to furnish food for the nitrifying organisms; but it appears that this is not essential in all cases, because certain forms of life have been found to be capable of nitrifying inorganic solutions, obtaining their carbon from carbon dioxide gas. In the presence of a considerable amount of organic carbon, especially when the conditions are otherwise unfavorable to nitrification, an inverse process, known as "denitrification," is likely to result, such nitrates as happen to be present being thereby reduced to compounds that are less highly oxidized. Denitrification also appears to be due to the activities of special micro-organisms, and whether the nitrates of a soil increase or decrease depends upon which of the two antagonistic kinds of organism is most highly favored by the conditions. Moisture is essential in both cases, but its absolute amount is of the greatest importance. Nitrification may be proceeding rapidly in a soil that is moderately moist and well aerated, and yet the same soil, when thoroughly waterlogged, may be a vigorously denitrifying medium. Nitrification proceeds best in the dark, and strong light checks it in a marked manner, or even stops it altogether. In nature, nitrification is most active within a few inches of the surface of the ground, and it takes place only with exceeding slowness at a depth of two or three feet. Some micro-organisms transform nitrogenous compounds into compounds of ammonia, some transform ammoniacal salts into nitrites, and some transform nitrites into nitrates. In nature, it is probable that all these processes go on simultaneously. It was long believed that the free nitro-

gen of the air does not take part in the nitrification processes of the soil. It is now pretty generally admitted, however, that certain micro-organisms actually possess the power of absorbing free nitrogen, and fixing it in the form of a chemical compound. We do not yet know how general this power may be, but it appears to be exhibited, beyond dispute, by some of the microscopic forms of life that live, perhaps parasitically, upon the roots of the pea and certain similar plants.

Nitrile, in chemistry, a compound which may be regarded as derived from ammonia, NH_3 , by replacing the three hydrogen atoms by a single trivalent organic radical. (Compare AMIDE.) They have the general formula XCN , where X represents methyl (CH_3), ethyl (C_2H_5), or some similar monovalent alcoholic radical, and they may therefore be regarded as alkyl cyanides. They may be prepared by distilling potassium-alkyl sulphates with potassium cyanide, the general reaction being $\text{XKSO}_4 + \text{KCN} = \text{K}_2\text{SO}_4 + \text{XCN}$. Acetonitrile, for example, which has the formula CH_3CN , may be prepared by distilling dry potassium-methyl sulphate, CH_3KSO_4 , with dry potassium cyanide, KCN . Acetonitrile is also known as methyl cyanide, and is a colorless, inflammable liquid with an ethereal odor, mixing readily with water and with alcohol, having a specific gravity of 0.80, and boiling at about 178° F.

Nitrile of Amyl. See AMYL NITRILE.

Nitrous, salts of nitrous acid (q.v.).

Nitro-benzene, or **Nitro-benzol**, a liquid chemical substance having the formula $\text{C}_6\text{H}_5\text{NO}_2$, which is formed by the action of fuming nitric acid upon benzene. See ANILINE and BENZENE.

Nitro-cellulose, a compound of nitric acid with cellulose, in which the hydroxyl of the cellulose is more or less completely replaced by molecules of NO_2 . An exchange of NO_2 for OH always occurs when cellulose is treated with nitric acid, but the extent of the nitration depends upon the circumstances of the treatment. The nitro-celluloses are more properly described as "cellulose nitrates," and five of them are known. Of these, collodion pyroxyline and gun-cotton are the most important. Collodion pyroxyline is a mixture of the tetra-nitrate and tri-nitrate, and gun-cotton (which is sometimes described as the tri-nitrate) is really the hexa-nitrate, its chemical formula being $\text{C}_6\text{H}_7\text{O}_5\text{N}_6$ (NO_2)₆.

Nitro-Compounds, in chemistry, compounds in which one or more atoms of hydrogen are replaced by an equal number of nitroxyl (NO_2) radicals, the nitroxyl radicals being directly connected with carbon by means of their nitrogen atoms. Many of the nitro-compounds are of great importance in the chemistry of coal-tar derivatives. Nitro-benzene, $\text{C}_6\text{H}_5\text{NO}_2$, for example, which is obtained by the action of nitric and sulphuric acids upon benzene, is the source from which commercial aniline is manufactured. See ANILINE and BENZENE. Consult, also: Benedikt, 'Chemistry of the Coal-Tar Colors.'

NITRO-HYDROCHLORIC ACID—NITROGEN

Nitro-hydrochloric Acid, Nitro-muriatic Acid, or Aqua Regia, a mixture of nitric and hydrochloric acids, formerly known as "aqua regia," or "royal water," on account of its power to dissolve gold. See **NITRIC ACID**.

Nitrogen (Greek, "producing nitre"), a gaseous, non-metallic element existing in nature in the free state, and also occurring, in chemical combination, in numerous minerals. It is an essential constituent of many of the animal and vegetable tissues, especially of the proteids, or albumen-like substances. It exists in the free state in the earth's atmosphere, of which it constitutes 77 per cent by weight, or about four fifths by bulk. Nitrogen is a colorless gas, without taste or odor, and it will neither burn nor support combustion. It is not poisonous (as is evident from its presence in the air), and when inhaled in the pure state it produces asphyxia only by excluding oxygen from the lungs. Nitrogen is slightly lighter than air, its density being approximately 0.97247, when that of air is taken as unity. According to Jolly, a cubic decimetre of nitrogen, under a pressure of 760 millimetres of mercury at the sea-level in lat. 45°, weighs 1.25746 grams. The specific heat of nitrogen at constant pressure, as compared with an equal weight of water, is 0.2368; and, according to Chappuis, if a given mass of the gas, at an initial temperature of 32° F. and a pressure of one metre of mercury, be heated at constant volume to 212° F., its pressure becomes equal to that due to 1.36745 metres of mercury. (This last-given constant was determined with the greatest care, as it is of the highest importance in modern precise thermometry by means of the nitrogen thermometer.) Nitrogen can be liquefied by the simultaneous application of great cold and great pressure. Sarrau gives its critical temperature and pressure as 191° F. below zero, and 42 atmospheres, respectively. Rutherford, in 1772, showed that the expired air of men and animals contains a gas which will not support combustion, and which is nevertheless different from carbon dioxide, since caustic potash will not absorb it. Shortly afterward Lavoisier proved that this gas exists in the free air, and since it will not support life he called it "azote" (Greek, "not supporting life"), a name by which it is still known in France, and some of whose derivatives also survive in English. ("Azo-benzene," for example.) The modern word "nitrogen" is due to Chaptal.

Chemically, nitrogen has the symbol N, and an atomic weight of 14.04 if $O=16$, or 13.93 if $H=1$. It may be prepared in a state of approximate purity from the atmosphere, by the following process: A slow stream of air is passed through tubes of moistened potassium hydrate to absorb carbon dioxide, then through tubes of calcium chloride to absorb moisture, then through a tube containing red-hot copper turnings to remove the oxygen, then through a solution of chromium chloride to remove the last traces of oxygen, then again through tubes of calcium chloride to remove moisture, and lastly over phosphorus pentoxide to complete the removal of moisture, and also to absorb any ammonia that might be present. The nitrogen so obtained will still contain argon, helium, neon, and the other recently discovered inert gases of the atmosphere, however; and if these

are objectionable, it is best to prepare the nitrogen from some of its compounds, from which argon and similar gases are necessarily absent, on account of their chemical inertness. Ammonium nitrite, NH_4NO_2 , is a convenient substance for this purpose, because it is resolved, by heating, into water and free nitrogen, as indicated by the equation $NH_4NO_2 = 2H_2O + 2N$.

Free nitrogen does not exhibit any marked chemical affinity, though it can be made to combine with other elements in various ways, and its compounds are often exceedingly active, as is familiarly illustrated by nitric acid and by ammonia. Five oxides of nitrogen are known. (1) *Nitrous Oxid*, N_2O , for which see the article **NITROUS OXIDE**. (2) *Nitrogen Dioxid*, or *Nitric Oxid*, NO , discovered by Priestley, who called it "saltpeter-gas." This is a colorless gas, prepared by acting upon metallic copper with cold dilute nitric acid, HNO_3 ; copper nitrate, nitrogen dioxide and water being formed, as indicated by the equation

Nitrogen dioxide combines directly and readily with oxygen, the combination taking place promptly upon contact with common air, higher oxides of nitrogen being formed. The dioxide may be liquefied by the application of cold and pressure, but there is still much uncertainty about its critical point. The liquefied gas freezes at about 270° F. below zero. (3) *Nitrogen Trioxid*, or *Nitrogen Sesquioxid*, N_2O_3 , may be prepared (though not in a strictly pure state) by the action of nitric acid upon starch, or upon arsenic trioxide. It is a reddish gas, which condenses to a volatile blue liquid upon being cooled by a freezing mixture to 0° F. Nitrogen trioxide also dissolves in ice-cold water with the formation of a blue liquid containing nitrous acid, HNO_2 . (See **NITROUS ACID**.) (4) *Nitrogen Peroxid*, NO_2 , formerly known as the "dioxid." This oxid may be prepared by heating dry nitrate of lead, which then breaks up into lead oxide, oxygen, and nitrogen peroxide, as indicated by the equation $2Pb(NO_3)_2 = 2PbO + 4NO_2 + O_2$. It is a dark orange-colored gas, which has the molecular formula N_2O_4 at low temperatures, for which reason it is often called the "tetraoxid." At 300° F. the gas has the molecular formula NO_2 , as is proved by its density; and at ordinary temperatures it consists of a mixture of NO_2 and N_2O_4 . At about 370° F. a further dissociation into NO and O begins, this increasing as the temperature rises, until, at about 1,150° F., the dissociation into NO and O is complete. Nitrogen peroxide is easily liquefied and solidified. At temperatures lower than 14° F. it is a white, deliquescent, crystalline solid. At 16° F. this melts to a colorless liquid, which becomes yellow when warmed to 32° F., and orange at 70° F. Under ordinary atmospheric pressure it boils at about 72° F., with the evolution of the gaseous peroxide. (5) *Nitrogen Pentoxid*, or *Nitric Anhydride*, N_2O_5 , may be prepared by dehydrating concentrated nitric acid by the cautious addition of phosphorus pentoxide, or by passing chlorine gas over dry silver nitrate. In the latter case the reaction is $2AgNO_3 + 2Cl = 2AgCl + N_2O_5 + O$. The pentoxide is solid at ordinary temperatures, and may be obtained in the form of white, lustrous, translucent prisms, which have a specific gravity of

about 1.64, and melt at 36° F. with partial decomposition into the peroxid and free oxygen. At about 115° F. the liquid obtained by melting the crystals boils. The pentoxid combines with water to form nitric acid (q.v.).

Nitrogen combines directly with certain of the other elements to form compounds known as nitrides (q.v.). With chlorine it forms an oily liquid known as chloride of nitrogen, which has the formula NCl_3 , and may be prepared by passing chlorine gas through a solution of sal ammoniac. Chloride of nitrogen is one of the most dangerous explosives known, decomposing with fearful violence upon the slightest touch, and often with no assignable cause whatever. Several compounds of hydrogen with nitrogen are known, of which ammonia, NH_3 , is the most familiar and also the most important.

See AMIDE; AMINE; AMMONIA; NITRIC ACID; NITRIFICATION; NITROUS ACID; NITROUS OXID; etc.

Nitroglycerin, or **Glonoïn**, a powerful explosive discovered by Ascanio Sobrero in 1846, and first produced commercially by Emmanuel and Alfred B. Nobel, at Helenborg, Sweden, in 1866. The process of manufacture was much improved by George M. Mowbray of North Adams, Mass., and Walter N. Hill of the U. S. Torpedo Station, at Newport, R. I., these improvements yielding a product of greater purity, and also overcoming many of the dangers attending the manufacture, transportation and use of the substance. Nitroglycerin is manufactured by treating glycerin with a mixture of concentrated nitric and sulphuric acids, but the proportions of the material used and the methods of operation are different in different countries. In the United States the acids are usually mixed in the proportion of 2 parts by weight of nitric to 3 parts by weight of sulphuric, so as to contain 61.9 per cent of real H_2SO_4 , 34.5 per cent of HNO_3 , and not more than 0.7 per cent of N_2O_5 . These "mixed acids" are shipped from the acid works in iron drums holding 1,500 pounds each, this weight being a convenient charge for one run in the nitroglycerin converter. The "converter" or "nitratör" is a closed cylindrical vessel of lead, standing within a wooden one. The mixed acids are introduced by a pipe at the top of the converter, and the glycerin is forced into the vessel at the bottom, by means of compressed air. The fumes produced by the reaction are carried off through a "fume pipe," which is provided with a window to view the gases. The reaction between the glycerin and the acids causes the evolution of considerable quantities of heat; and to prevent the temperature of the converter from rising to the danger point, cold water is continually passed through the space between the lead cylinder and the wooden one, and also through a cooling coil of lead pipe, which is placed within the lead cylinder. Compressed air is also injected directly into the mixture to aid in the cooling, and extra air pipes are provided, for use in case the rise of temperature cannot be controlled by the means that are normally sufficient. The temperature of the mixture is continuously observed, by means of sensitive, specially constructed thermometers, which enter the converter through the top. In operating the process, the mixed acids are run into the con-

verter first, the cooling water is next turned on, and, lastly, the glycerin is slowly introduced at the bottom. When the materials are pure, and no particle of water is allowed to enter the mixture, and the temperature is not permitted to rise above 86° F., this part of the operation may be regarded as reasonably safe.

When the conversion is completed, the charge of the converter is run off into a "separator," which is a cylindrical leaden vessel provided with windows, with a vent pipe for the escape of vapors, and with an injector pipe, through which compressed air may be introduced for cooling purposes, in case any tendency toward rise of temperature is observed. When the charge is allowed to stand, the nitroglycerin rises to the top of the separator, and the spent acids, by reason of their greater density, sink to the bottom. The separation being nearly complete, the nitroglycerin is drawn off through an upper spigot, and the spent acids are drawn off at the bottom and passed to a second separator, for the removal of the last traces of nitroglycerin that they contain. The nitroglycerin is now repeatedly washed with water, then with a solution of soda ash, and again with water, until the last traces of acid are removed from it. The spent acids are sent to the "regaining" works, where the sulphuric acid (which is not destroyed in the process) is recovered for further use. The small quantity of nitric acid that remains unused is also recovered in a dilute form, and used for other purposes. Theoretically, 100 parts by weight of glycerin should yield 246 parts of nitroglycerin; but the yield in the United States is only from 200 to 220 parts.

Nitroglycerin is also known as "glonoïn," "Nobel's blasting oil," and "trinitroglycerin." It was originally supposed to be a nitro-substitution compound, like many other substances produced by the action of nitric acid upon organic compounds, and hence the name it now commonly bears. But Berthelot has shown that its reactions are those of a salt or ester of nitric acid, and its correct chemical name is now admitted to be "glyceryl trinitrate," or "propenyl trinitrate." "Glyceryl" or "propenyl" is the name of the organic radical C_3H_5 , and ordinary glycerin, $\text{C}_3\text{H}_5(\text{OH})_3$, is the hydrate of this radical. Nitroglycerin has the formula $\text{C}_3\text{H}_5(\text{NO}_2)_3$, and is formed from nitric acid and glycerin in accordance with the equation $\text{C}_3\text{H}_5(\text{OH})_3 + 3\text{HNO}_3 = \text{C}_3\text{H}_5(\text{NO}_2)_3 + 3\text{H}_2\text{O}$.

When chemically pure, glyceryl trinitrate is a colorless, odorless, transparent, oily liquid, but commercial nitroglycerin varies in color between a hock-wine and a dirty yellow. It has a specific gravity of 1.599 when liquid, and 1.735 when frozen. It freezes at 46° F. if exposed for a long time to this temperature, forming long, whitish crystals, which melt again upon prolonged exposure to a temperature of 52° F. According to Hess it volatilizes completely upon continuous exposure to a temperature of 158° F., and Guttman has found that dynamite (see below) loses 10 per cent of its nitroglycerin by an exposure of several days to a temperature of 104° F. Nitroglycerin is almost insoluble in water, but dissolves readily in wood alcohol, grain alcohol, ether, benzene, and many other organic liquids. It undergoes dangerous decomposition with explosion upon contact with

NITROUS ACID—NITROUS ETHER

sulphuric acid (except under the conditions of manufacture described above), and it is also decomposed by alkalis and by alkaline sulphides. The safest way to destroy it is by treating it with a solution of ammonium sulphide, or, where the quantity is large, with spent lime from the purifiers of gas works. Nitroglycerin has a sweetish, burning taste, and is poisonous, producing extremely violent headaches when taken by the mouth, absorbed through the skin, or inhaled as vapor; though some persons, by constant association with it, become immune to its physiological effects. The antidotes are cold compresses, fresh air, black coffee, and morphine. It is used in medicine as a heart stimulant, in the treatment of angina pectoris, in the revival of the drowned, and as an antidote in cases of poisoning by carbon monoxid and water gas.

The critical temperature of decomposition of nitroglycerin is between 113° F. and 122° F. At 113° F. it keeps indefinitely if free from acid, but between that temperature and 122° F. it begins to decompose, and at 160° F. decomposition goes on actively. Pure nitroglycerin is not very sensitive to friction or moderate percussion, except when pinched between metallic surfaces, or struck a glancing blow. If placed upon an anvil and struck with a hammer, only the particle struck, as a rule, explodes, the remainder being scattered; but this is an unsafe experiment to try with a quantity of the explosive, because in some cases the whole mass will be exploded. Frozen nitroglycerin is in general less sensitive to shock than the liquid, but explosions have occurred which were believed to be due to the breaking of a crystal of the solid substance. When a small quantity of nitroglycerin is freely exposed to a flame, it burns brilliantly and without explosion; but when the experiment is tried with a larger quantity, explosion is likely to follow. A drop of nitroglycerin, when placed upon an iron plate and slowly heated, may volatilize completely without exploding; and if the drop is placed on an iron plate that is previously heated to incandescence, it will assume the spheroidal condition and volatilize without explosion; but if the plate be heated to a temperature just below incandescence the drop explodes violently upon contact with it. Nitroglycerin was at first exploded, in blasting, by means of a gun-powder fuse, and this method is still used to a limited extent with dynamite; but it is chiefly fired by means of a powerful detonator, by which its greatest explosive efficiency is realized.

Nitroglycerin is principally used in the manufacture of dynamite, explosive gelatine, gelatine dynamites, and smokeless powders such as ballistite and cordite. The liquid substance is used in torpedoes for oil wells, to remove the paraffin which clogs them or to shake the oil-bearing sandstone so as to secure a better flow of oil. Owing to the difficulty and danger of transporting and handling liquid nitroglycerin, attempts were early made to absorb the liquid by means of some substance which would not interfere with its explosive action, but which would form with it a solid body, or a powder, which could be handled more conveniently and safely. Many such absorbents have been tried, charcoal being the first; but Nobel found that

a kind of infusorial earth, consisting chiefly of the silicious remains of diatoms, and known as "kieselguhr," is much superior to charcoal, and this substance is now largely used as an absorbent, in the manufacture of common "dynamite." Sawdust, especially in combination with certain chemical substances, is used as an absorbent to a considerable extent. "Dualin," for example, is a mixture of 50 parts of nitroglycerin, 30 of sawdust, and 20 of saltpeter, and "Atlas powder" and "Hercules powder" consist of nitroglycerin, carbonate of magnesia, wood fibre, and sodium nitrate. "Blasting gelatine," invented by Alfred Nobel, consists of nitroglycerin gelatinized by the addition of nitrated cotton fibre; its manufacture being based upon the fact that a mixture of mononitro-cellulose and dinitro-cellulose, when free from unnitrated cotton and from trinitro-cellulose ("gun-cotton"), dissolves in warm nitroglycerin with the formation of a gelatinous substance. "Gelatine dynamite" consists of a mixture of thin blasting gelatine with wood meal and saltpeter.

During 1900 the United States produced 35,482,947 pounds of nitroglycerin, of which 31,661,806 pounds were used in further manufactures.

CHARLES E. MUMFORD,
Professor of Chemistry, The Columbian University, Washington, D. C.

Nitrous Acid, an acid which has the formula HNO_2 , but which is too unstable, in the free state, to admit of isolation. A blue, aqueous solution of it may be prepared by dissolving nitrogen trioxid in ice-cold water (see *Nitrogen*); but when this solution is warmed the nitrous acid decomposes into nitric acid, nitric oxide and water, as indicated by the equation $3\text{HNO}_2 = \text{HNO}_3 + 2\text{NO} + \text{H}_2\text{O}$. The salts of nitrous acid (which are known as "nitrites") are more stable, and certain of them occur in the soil as a result of the oxidation of organic matter. (See *NITRIFICATION*.) The nitrites of the metals are mostly soluble in water and in alcohol, their solutions being decomposed by boiling, or by the addition of dilute sulphuric acid. Potassium and sodium nitrites may be prepared by melting the corresponding nitrates with metallic iron, and crystallizing from solution in water. Silver nitrite, AgNO_2 , may be prepared by heating starch with nitric acid, passing the resulting gas into a solution of caustic potash, neutralizing this with acetic acid, and finally adding a solution of silver nitrate. It crystallizes in small white crystals, is one of the most insoluble nitrites, and may be used in the preparation of many of the others. Ammonium nitrite, NH_4NO_2 , for example, may be obtained by adding a solution of silver nitrite to one of ammonium chloride (sal ammoniac). Nitrite of ammonium is used as a source of nitrogen, since it is decomposed by the action of heat into water and free nitrogen. Many of the organic derivatives of nitrous acid are also of importance. (See, for example, *AMYL NITRITE* and *NITROUS ETHER*.)

Nitrous Ether, or **Ethyl Nitrite**, the nitrite of the organic radical "ethyl." It has the chemical formula $\text{C}_2\text{H}_5\text{NO}_2$, and is usually prepared by acting upon ethyl alcohol with nitric acid. It is a yellowish liquid having a specific gravity of about 0.90, and boiling at 64° F. It mixes readily with alcohol, but only to a slight extent

NITROUS OXID—NIXON

with water. It decomposes when kept in contact with water, evolving nitric oxid (NO). When mixed with about 20 times its own volume of alcohol (rectified spirit), it is known as "spirit of nitrous ether," or "sweet spirit of nitre," and is used in this form as a diuretic and febrifuge.

Nitrous Oxid, or Nitrogen Monoxid, a gaseous substance having the chemical formula N_2O , and obtained by heating ammonium nitrate, NH_4NO_3 , as indicated by the equation

Care must be exercised in its manufacture, as ammonium nitrate, when heated, is liable to explosive decomposition. Nitrous oxid is a colorless gas, with a slightly sweet taste. It supports combustion nearly as well as oxygen, and when subjected to a pressure of 30 atmospheres at 32° F., it condenses into a colorless, mobile liquid. When inhaled, it is apt to produce exhilaration, for which reason it is commonly called "laughing gas." Sir Humphry Davy, in experimenting with nitrous oxid about the year 1801, discovered that it produces insensibility when inhaled for a sufficient time, and in recent years it has been used as an anæsthetic for dental work and other minor surgical operations. Davy himself suggested this use in the following words: "As nitrous oxid, in its extensive operation, seems capable of destroying physical pain, it may probably be used with advantage in surgical operations in which no great effusion of blood takes place." It does not appear that the gas was so used, however, until 1844. On 10 December of that year Dr. Gardiner Q. Colton gave a lecture on "Laughing Gas," in Union Hall, Hartford, Conn., administering the gas to several of his auditors, for the purpose of illustrating its peculiar properties. Horace Wells, a Hartford dentist, was present at the lecture, and was impressed by the practical possibilities that appeared evident to him. On the following day Wells obtained a supply of the gas from Colton, inhaled it himself until he became unconscious, and while he was in this condition Dr. Riggs extracted one of his teeth. When consciousness returned, a few minutes later, he exclaimed, "I didn't feel it! The greatest discovery of the age!" About the same time Dr. William T. G. Morton and Dr. Chas. T. Jackson, of the Massachusetts General Hospital, at Boston, introduced ether as an anæsthetic, and a patent for its use was issued to them in November 1846. There has been much bitter controversy concerning the priority of Wells and of Morton and Jackson, as regards the introduction of anæsthetic methods in surgery; but so far as nitrous oxid is concerned, the evidence appears to favor Wells. Morton and Jackson experimented chiefly with ether, a substance which Wells appears to have used in his practice only upon one occasion. Consult 'The Locomotive' for November, 1889.

Nitzsch, nitsh, Karl Immanuel, German theologian: b. Borna, Germany, 21 Sept. 1787; d. Berlin, Germany, 21 Aug. 1868. He was a son of Karl Ludwig Nitzsch and was educated in Wittenberg, becoming professor of a theological seminary in Berlin in 1817 and in 1822-47 he was professor at Bonn. He then returned to Berlin where he was professor, university preacher and a member of the high consistory. He published: 'System der christlichen Lehre'

(1829); 'Praktische Theologie' (3 vols. 1847-67); etc.

Niu-chuang, nü-chwäng, New-chwang, or Ying-tse, China, a city of Manchuria, on the Liao-ho River, about 35 miles from its mouth. It is practically an inland city, but was chosen as one of the ports to be opened to foreign commerce by the treaty of Tien-tsin (1858). The foreign settlements and the trade, however, are at Ying-tse, near the river's mouth, which is known to Europeans as Niu-chuang. The port is connected by railway with Tien-tsin, and also with the great Siberian Railway. Though closed by ice in the winter months, it carries on an important trade. Ying-tse imports cotton, woolen, and silk goods, sugar, paper, metals, opium, tobacco, etc.; total value of imports in 1901, \$2,146,868; and exports beans, silk, ginseng, skins, and horns; total value of exports in 1901, \$3,651,880. The import of Indian opium has fallen from \$2,860,000 in 1866 to about \$40,000. Large quantities of salt are manufactured in the vicinity. The port was captured by the Japanese in March 1895, and was occupied by the Russians in 1900. See MANCHURIA. Pop. 60,000.

Niné, né-oo'-ä, Niné-Fekai, or Savage Island, in the South Pacific Ocean, politically dependent to New Zealand since 1900, is of ancient coral formation, 14 miles long, 10 miles wide, with a maximum altitude of 200 feet, and an area of 36 square miles. The soil is very productive, yielding coconuts, taro, yams, and bananas. Copra fungus, and straw hats are exported. Pop. (1903) 4,400, Malayo-Polynesians, all Christians, due to the labors of the London Missionary Society.

Niv'ën, William, American mineralogist: b. Bellskill, Lanarkshire, Scotland, 6 Oct. 1850. After a common-school education in Scotland, he came to the United States in 1879, and pursued mineralogical investigations. He discovered four new minerals,—yttrialite, thorogummitite, and nivenite in Llano County, Texas, in 1889, and aguilarite at Guanajuato, Mexico, in 1891. In 1891 he also found the remains of a prehistoric people, covering several hundred square miles in the state of Guerrero, Mexico. He was assistant commissioner of Arizona to the New Orleans Exposition.

Nivernais, né-vér-nä, France, an ancient province corresponding nearly to the present department of Nièvre.

Nix, or Nixle, in German folk-lore, the name of water spirits (male and female), haunting rivers, brooks, ponds, and lakes. See also NICKER.

Nix'on, John, American military officer: b. Framingham, Mass., 4 March 1725, d. Middlebury, Vt., 24 March 1815. In the expedition against Cape Breton in 1745 he fought under Sir William Pepperell and was at the capture of Louisburg. He joined the colonial forces at the outbreak of the American Revolution and fought at the battle of Lexington, and at Bunker Hill he commanded a regiment. He was made brigadier-general in 1777 and was given command of Governor's Island in New York harbor. He served under General Gates in the battle of Stillwater, and in 1780 failing health compelled his retirement.

NIXON — NIZAM'S DOMINIONS

Nixon, John, American soldier: b. Philadelphia, Pa., 1733; d. there 31 Dec. 1808. He was early prominent in opposing the taxation demands of England, and in 1774 became a member of the first committee of correspondence in Pennsylvania; and was also a member of the committee of safety. In 1775 he became lieutenant-colonel of a battalion which he led at the battle of Princeton in 1777. In 1776 he commanded at Fort Island, and later in the same year was placed in command of the guard of the city of Philadelphia; he was the first to publicly proclaim the Declaration of Independence in the city on 8 July. He served in the army till 1780, and was a member of the navy board and director of the provision supply. He was one of the organizers of the Bank of North America, and its president from 1792 to 1808.

Nixon, Lewis, American shipbuilder: b. Leesburg, Va., 7 April 1861. He was graduated from the United States Naval Academy in 1882, and was then sent to the Royal Naval College at Greenwich, England, to take a special course in naval architecture from which he was graduated in 1885. In 1884 he had been appointed to the construction corps of the navy, and on his return from abroad was ordered to duty in connection with the building of the cruisers Chicago and Boston; he was later superintending constructor for the navy at the Cramp shipyard, and assistant constructor at the Brooklyn Navy Yard. In 1890 he designed the battleships of the Indiana class, and when the contract for these vessels was awarded to the Cramp shipyard, he resigned from the navy to become superintending constructor there. He retained this position until 1895, when he leased the Crescent shipyard at Elizabeth, N. J., where he built two vessels within six years, including the sub-marine torpedo boat Holland. In 1902 he became president of the United States Shipbuilding Company, which includes the Crescent shipyard, the Eastern Shipbuilding Company, and others; and he is also connected with other manufacturing interests. In politics he has been allied with the Democratic party; was appointed a commissioner of the East River Bridge in 1898; and in November 1901 succeeded Richard Croker as leader of Tammany Hall, resigning the position in May of the next year; he has also been chairman of the finance committee of the Democratic Congressional Campaign Committee.

Nixon, Oliver Woodson, American journalist: b. Guilford County, N. C., 25 Oct. 1825. He was graduated from Farmers' College, Ohio, in 1848, and from Jefferson Medical College, Philadelphia, in 1854. During the Civil War he was medical director of the Army of Missouri and in 1870 established the Cincinnati *Evening Chronicle*. With his brother, W. P. Nixon (q.v.), he merged it with the Cincinnati *Times*, and in 1878 they purchased the *Inter-Ocean* of Chicago, of which he has since been literary editor. He has published 'How Marcus Whitman Saved Oregon for the Union' (1895).

Nixon, William Penn, American journalist: b. Fountain City, Wayne County, Pa. He was graduated from Farmers' College, Ohio, in 1854 and from the law school of the University of Pennsylvania in 1859. He practised his pro-

fession in Cincinnati till 1860 and sat in the Ohio Legislature 1865-8. He was business manager of the Cincinnati *Chronicle*, 1868-72, and since the date last named has been associated with the Chicago *Inter-Ocean*, which he purchased with his brother O. W. Nixon (q.v.) as publisher, manager and editor. In 1897 he was appointed collector of the port of Chicago.

Niza, nēt'sā, Marcos de (also called FRAY MARCOS), Italian missionary in America: b. Nice at the beginning of the 16th century; d. between 1550 and 1570. He gets his name, de Niza, from the city of Nice, where he lived and entered the Franciscan Order. His governor-general Antonio de Mendoza, on the request of Marcos' bishop and friend Bartolome de las Casas, sent him about 1531 to New Galicia in order to reassure the Indians there that the purpose of the Spaniards was simply to convert the natives, not to enslave or conquer them. Fray Marcos lived successively in Peru, Guatemala and Mexico, and in 1539 undertook to explore the Northwest and to discover the truth of the story told by Cabeza de Vaca of the seven cities of Cibola and their golden wealth. Niza probably made his way into Arizona, and is frequently called the 'discoverer of Arizona.' Upon his return he published a book locating the 'seven cities,' for which he must have mistaken the Zuni pueblos. But the hopes to which he roused Mendoza were shattered by the expedition led by Coronado in 1540, which found no gold in Cibola. Niza's 'Descubrimiento de las siete ciudades' was edited by Ramusio, but is most accessible in a French version (1838).

Nizami, nī-zā-mē' (full name ABU MOSAMMED BEN YUSUF SHAIK NIZAM-ED-DIN), Persian poet: b. Western Persia 1141; d. Ganjah 1203. Besides a 'Divan,' or collection of lyrics, he wrote five larger poems, upon which his poetic fame rests, and which in Persia are regarded as masterpieces which no subsequent attempts have been able to equal. These poems are (1) 'Makhzan-al-asrar' ('Storehouse of Mysteries'), a didactic poem, in which theoretical doctrines as to ethics alternate with historical details, anecdotes, and fables; (2) 'Khusrau and Shirin,' a romantic epic, which has for its subject the love of the Persian king Khusrau for Shirin; (3) 'Laila and Majnun,' which describes the love of Majnun, a son of the Arabian desert, for the beautiful Laila; (4) 'Haft Paikar' ('Seven Portraits'), a collection of seven novels in a kind of poetical heptameron. The most famous of these tales is the 4th, called Turan-docht, which, after being subjected to various changes, furnishes the materials of Gozzi's and Schiller's well-known dramas; (5) 'Iskandar Namah' ('Alexander Book'), a traditional and embellished history of Alexander the Great, taken from the Greek poem on that subject by the pseudo Callisthenes. These five have been assembled in a collection known as 'Panj Ganj' ('The Five Treasures'). Nizami is not so familiar to western nations as Firdausi, Hafiz, or Sa'di; but in Persia he is among the foremost classics, and, in his peculiar field, may be placed second to Firdausi. 'Laila and Majnun' was rendered into English couplet verse by Atkinson (1836).

Nizam's (nī-zāmz') Dominions. See HYDERABAD.

Nizhan, nyé'zhān, or **Nyeshin**, nyé'zhén, Russia, city in the government of Chernigof; on a branch of the Desna which flows into the Dnieper. It is in a fertile agricultural region in which tobacco is one of the principal products. It has a large trade in grain and tobacco. Pop. 33,000.

Nizhni-Novgorod, nézh'ní-nóv'go-rod. See **NIJNI NOVGOROD**.

Njord, nyérd, in Scandinavian mythology, god of the wind and waves. See **MYTHOLOGY**.

No Am'mon, or **No**, the Hebrew designation for Thebes, the Disopolis Magnus of the Greeks. It is mentioned in Nah. iii. 8 (מִן הַמִּצְרַיִם) and in Ezek. xxx. 14-16; Jer. xlv. 25 (מִן הַמִּצְרַיִם). The shorter form, **No**, seems to have prevailed generally among the Hebrews, and the Assyrian records call the city Ni, while in Egypt after the 21st dynasty it is written Nt, doubtless pronounced ne-t. Nahum's reference to it as "part of Ammon" makes its identity with Thebes positive. See **THEBES**.

No-body Crab, or **Sea-spider**. See **PAN-TORODA**.

No Man's Land, a name applied to outlying districts in various countries; at one time to what is now mainly Griqualand East; also to a territory of 80,000 square miles in South Australia; to a small island near Martha's Vineyard, Mass.; to a strip of land bordering on Pennsylvania, Delaware, and Maryland, still in dispute between those States because of the displacement of the early boundary stones. Most commonly, however, the name is applied to Oklahoma in the following connection: In 1845 Texas, on being admitted into the Union, ceded to the United States that strip of her land which lay north of lat. 36° 30' N. This piece, 167 miles by 35, was without government until 1890, when it became a part of Oklahoma. At one time there was a great rush of prospectors and settlers to this section.

No Name, a novel by Wilkie Collins (q.v.) published in 1862.

Noachian (nó-á'ki-an) **Precepts**, seven canons or laws which, according to the Talmud, were given by Jehovah to the sons of Noah. These precepts are analogous to what among the Romans was classed as Natural Law or *ius Gentium*, a code revealed by the consensus of conduct among the Mediterranean nations. The seven Noachian Precepts enjoin: 1. Submission to civil authorities, kings, judges, etc. 2. Avoidance of idolatry and sacrilege. 3. Reverence to the name of God, as in taking an oath. 4. Proper restraint and direction of the human sexual instinct. 5. Reverence for life, even of animals, by refusing to consume the blood of beasts as food. 6. Respect for the rights of property. 7. Refusal to eat the member of a living animal. The expanding and refining genius of the Rabbins sometimes adds four others to these seven, namely: 1. The blood of a living animal is not to be drawn for the purpose of drinking it. 2. Animals are not to be mutilated. 3. Magic and sorcery are unlawful. 4. The crossing of animals and grafting of trees are also unlawful. No stranger was allowed to dwell in Hebrew territory unless he conformed to the Noachian Precepts and became a "proselyte of the gate"; in contradis-

tinction to the strangers who conformed by being circumcised, and were styled "proselytes of righteousness."

Noack, nó'ák, August, German painter: b. Darmstadt 1822. After painting under Sohn, Lessing and Schadow, in the Düsseldorf Academy (1839-42), he continued his student life in Munich and Antwerp, but eventually settled in his native town 1855, where he was made court painter and professor at the Polytechnic. He has painted several fine altar-pieces, and his 'Visit of Landgrave Philip the Magnanimous to Luther' (Rostock Gallery) and 'The Disputation at Marburg' (Darmstadt Gallery) give him high rank as a painter of historical pictures.

Noah, nó'á, according to the Hebrew Scriptures, the son of Lamech, and 10th in descent from Adam. He was the first ancestor of the new race of men who should people the earth after the flood, in which points he is the counterpart of the Chaldaic Xithuthros, the Hindu Prithu, and the Greek Deucalion, severally. We read nothing of him from his birth till he is 500 years old, when we are told that he begat three sons, Shem, Ham, and Japheth. Having been warned by God of the coming flood, he built an ark or great vessel by the direction of Jehovah, into which he entered with his family and all kinds of animals of every kind. After the waters had subsided the ark rested on Mount Ararat, where Noah offered a burnt-offering to God, and was assured that the earth should never again be destroyed by a flood. This is the first passage in the Bible where altar or burnt-sacrifice is mentioned. As a sign of this covenant with Noah, God set the rainbow in the clouds. Noah died at the age of 950 years, 350 years after the flood. The narrative marks several important points in the history of civilization. In agriculture, the recognition of such seasons as seed time and harvest; and the discovery of the vine, which is made such a salient point in Greek mythology; the institution of sacrificial worship; the institution of civil government. The Noachian Precepts (q.v.) are founded on Genesis ix. 1-17.

Noah, Mordecai Manuel, American politician and journalist: b. Philadelphia 19 July 1785; d. New York 22 March 1851. Through the influence of Robert Morris he was appointed clerk in the auditor's office of the United States Treasury. On the removal of the national capital from Philadelphia to Washington, he resigned his clerkship, and was for a time reporter at the sessions of the Pennsylvania Legislature at Harrisburg. In 1813 he was appointed United States consul at Tunis, with a special mission to Algiers. Captured in the English Channel by an English war ship, on 3 July 1813, he was detained several weeks as a prisoner of war, and then released, next proceeding by way of Spain to his post of duty. He succeeded in ransoming the American prisoners whom the Algerians held in slavery, but was recalled on the pretext that his religion was incompatible with his consular position at Tunis. He was abundantly vindicated later. In those days the United States paid a yearly tribute of \$500,000 to Tunis for the privilege of navigating the Mediterranean. Noah denounced such payment, insisting that the money would be better spent in building war ships. Returning home in 1819

NOAH—NOBEL

and settling in New York city he published a volume of his 'Travels in England, France, Spain and the Barbary States,' and founded the 'National Advocate.' In 1822 he was elected high sheriff of the city and county of New York. After the discontinuance of the 'National Advocate,' he began the 'New York Enquirer' which was merged with the 'Courier' and became the 'Courier and Enquirer,' in partnership with James Watson Webb, but political differences soon dissolved their connection. Appointed by President Jackson surveyor of the port of New York, he established in 1834 the *Evening Star* and became judge of the court of sessions. In 1842 he started a daily, *The Union*, which became a weekly and under the title, 'Noah's Sunday Times and Messenger,' was edited by him until his death. A most interesting project in which he engaged in 1820 was to re-establish the Jewish nation and form a place of refuge for Jewish emigrants on Grand Island, in the Niagara River, near Buffalo. In 1825 with impressive ceremonies, he laid the cornerstone of the proposed city at White Haven, but the new 'Ararat,' as it was termed, came to naught. Noah's literary activity was varied; it included a large number of addresses and essays, a translation of the 'Book of Yashar,' and many plays, some of them popular in their time. He was ever broad-minded and charitable, and a picturesque figure of his time. Consult: Wolf, 'Mordecai Manuel Noah: A Biographical Sketch' (1897); Morais, 'Eminent Israelites of the 19th Century' (1886).

Noah, Samuel, American soldier: b. London, England, 19 July 1779; d. Mount Pulaski, Logan County, Ill., 10 March 1871. Of Jewish descent and a cousin of M. M. Noah (q.v.), at 20 he emigrated to America, and was appointed 5 May 1805 cadet in the 1st Regiment of Artillery. He was graduated 9 Dec. 1807, was promoted ensign in 2d Regiment and after desultory service in the Gulf States resigned (13 March 1811) his commission of 1st lieutenant in the army. He joined Magee's Mexican forces which were besieged at Fort Bahia (14 Nov. 1812) by the Spanish royalists. On Magee's death, Noah in command of the rear-guard routed the enemy and captured San Antonio. War having been declared by the United States against England, Noah left Texas to re-enter the United States army, but on President Madison's refusal to re-commission him, volunteered as a private soldier to defend Brooklyn and served to the end of the war. At the time of his death he was the oldest graduate from West Point. Consult Cullom, 'Biographical Sketches of Deceased Graduates of the U. S. Military Academy.'

Noah Chypola. See CLAYTON, NOAH.

Noah, Book of, a legendary pseudographical book purporting to throw fuller light on the antediluvian and post-diluvian years of Old Testament history. Its date and authorship are equally uncertain.

Noailles, nō-l, French family from Limousin, dating from the 11th century. Its more important members are as follows: ANTOINE DE NOAILLES, b. 1504; d. Bordeaux 11 March 1562. He was admiral of France, ambassador to England 1553-6, the king's agent in the Truce of Vaucelles, and governor of Bordeaux.

His grandson, ANNE JULES DE NOAILLES, b. Paris 1650; d. Versailles 1708; was a servile courtier of the French king, who made him marshal of France in 1693. His son, AMBROISE MAURICE, DUC DE NOAILLES, b. Paris 29 Sept. 1678; d. there 24 June 1766; like his father was marshal of France (1734). Before this he had made his reputation by his financial policy and his opposition to Law. He fought in the war of the Polish Succession, became commander-in-chief of the army in Italy in 1735, and in the war of the Austrian Succession was crushingly defeated at Dettingen. His memoirs were edited by Millot (1777) and his correspondences by Rousset (1865). His son LOUIS, b. Versailles 21 April 1713; d. Paris 22 Aug. 1793; fought in Flanders and Germany; became marshal of France in 1775. LOUIS MARIE, VICOMTE DE NOAILLES, b. Paris 1756; d. Havana 1804; married a sister of Lafayette's wife and with Lafayette urged French intervention, and fought in America in behalf of the American Colonies, in which he took refuge during the darkest days of the Revolution. He returned to France soon afterward, but resigned from the army in 1792, again came to America, and fought bravely in the French army in San Domingo, being killed in the brilliant capture of an English war vessel off Havana. PAUL, a great-grandson of Louis, b. Paris 4 Jan. 1802; d. there 12 May 1885; upheld the Bourbons and wrote 'Histoire de Mme. de Maintenon' (1848-58) and 'Histoire de la Maison de St. Cyr' (1865). His great-grandson, in turn, EMANUEL HENRI, MARQUIS DE NOAILLES, b. 13 Sept. 1830; d. 16 Feb. 1909; was French minister to Washington 1872, to the Papal Curia 1873, to Rome 1876-82, to Constantinople 1882-90, and 1896-1902 to Berlin; and wrote on Polish history. His brother JULES CHARLES VICTORIN, DUC DE NOAILLES (1826-95), was a well-known economist, one of the editors of the *Revue des Deux Mondes*, and author of many economic and historical studies.

Nobbe, nō'bē, Friedrich, German plant physiologist: b. Bremen, Germany, 20 June 1830. He was educated at Jena and Berlin, and in 1861 was called to a professorship at the Industrial School in Chemnitz. In 1868 he joined the faculty at the Academy of Forestry and Agriculture at Tharandt, where he founded an experiment station for plant physiology, and he originated, in 1869, scientific seed testing. He has published: 'Wider den Handel mit Waldgrasamen für die Wiesenkultur' (1876); etc.

Nobel, nō'bēl, Alfred Bernard: b. Stockholm, Sweden, 21 Oct. 1833; d. San Remo, Italy, 10 Dec. 1896. He was the third son of Emmanuel, and in 1843 his father moved with his family to Saint Petersburg, Russia. In 1850 he sent Alfred to the United States to study under the famous engineer John Ericsson. On reaching his 21st year the son returned to Saint Petersburg trained as an engineer and moreover able to speak fluently Swedish, Russian, English, German and French. Later he took up the study of chemistry and showed a marked preference for that science in its technical applications. Emmanuel Nobel went to Russia under contract to prepare mines and torpedoes for the Russian government, and erected on the Neva works for their manufacture which eventually

NOBERT'S TEST-PLATES—NOBILITY

were extended to include the manufacture of firearms and agricultural implements.

After Alfred returned from America he was constantly engaged with his father in pursuing some invention. Among other substances nitroglycerin especially occupied their attention, and finally in 1862 they had erected a works at Helsenborg, Sweden, where nitroglycerin was manufactured on a commercial scale for the first time in its history. In 1864 the works were destroyed by an explosion which killed the chemist, and Alfred's younger brother Oscar, and the calamity so affected Emmanuel Nobel as to bring on a paralytic stroke which left him permanently crippled. Alfred Nobel immediately erected new works on a barge anchored in Lake Mälaren and in 1865 enlisted capital to erect works on a large scale at Winterviken, Sweden, and Krümmel, Germany. So many accidents occurred with nitroglycerin, and especially the destruction of a vessel transporting it at Aspinwall on the Isthmus of Panama attracted such attention, that its transportation was interdicted by many governments. In the latter part of 1866 Nobel discovered dynamite which replaced it and which was at once manufactured in his Swedish and German factories and in 1868 at a factory which he started near San Francisco, Cal. In 1871 he erected at Ardeer, Scotland, the works which are now the largest dynamite works in the world. In fact dynamite met with such acceptance that works sprang up in all civilized countries, and while in 1867 but 11 tons were made, in 1882, 9,500 tons were produced and in 1900 the United States alone manufactured 42,923 tons. In 1875 Nobel invented explosive gelatine and the gelatine dynamites. In 1888 he invented ballistite. Alfred Nobel was interested in many other arts than that of explosives, having taken out in England alone 129 patents. With his brothers Ludwig and Robert he formed in 1878 the famous firm of Nobel Brothers that operated the petroleum wells at Baku, Russia, and has proved the most active competitor of the Standard Oil Company. He also purchased the large ordnance works at Bofors, Sweden, that he might the more readily carry out his inventions in ordnance and his investigations in metallurgy. At his death he left an estate worth over nine millions of dollars, and in his will, after leaving small legacies to his already wealthy relatives, directed that the residue should constitute a fund the interest from which should be divided into five equal amounts and awarded as prizes to the person who shall have made, (1) the most important discovery or invention in the domain of physics; (2) in chemistry; (3) in physiology or medicine; (4) who shall have produced in the field of literature the most distinguished work of an idealistic tendency; and (5) who shall have most or best promoted the fraternity of nations, the abolishment or diminution of standing armies and the formation and increase of peace congresses. Prizes (1) and (2) are awarded by the Royal Academy of Science in Stockholm; (3) by the Caroline Medical-Chirurgical Institute in Stockholm; (4) by the Swedish Academy in Stockholm, and (5) by the Norwegian Storting (Parliament). The statutes approved by King Oscar of Sweden require among other conditions "that every candidate for a prize . . . be proposed as such in writing by some duly

qualified person. A direct application for a prize will not be taken into consideration." "Every written work, to qualify for a prize, shall have appeared in print." "No work shall have a prize awarded to it unless it has been proved by the test of experience or by the examination of experts to possess the pre-eminent excellence that is manifestly signified by the terms of the Will." The announcements of the awards are made on 10 December when the prize is given together with a diploma and gold medal. It is expected that within six months thereafter the prize-winner will lecture upon the subject for which the prize is awarded at Stockholm, or, in the case of the Peace prize, at Christiania.

The will was contested by heirs but a compromise was effected on condition that a portion of the property be devoted to the founding of institutions for research known as Nobel Institutes, which has been done. The income from the residue of the estate permits, however, of five prizes, each approximating closely to \$50,000 in value, being awarded annually. Awards were made for the first time 10 Dec. 1901, prizes being given in physics to Wilhelm Conrad Röntgen of Munich, discoverer of the Röntgen rays; in chemistry to Jacob Henry Van't Hoff of Berlin, founder of the science of stereochemistry; in physiology and medicine to Emil von Behring, discoverer of diphtheria serums; in literature to Armand Sully-Prudhomme of Paris. The prize for peace was divided between Henri Dunant of Switzerland, prime-mover of the Geneva Convention and of the Red Cross societies, and Frederic Passy, founder of the Universal Peace Union.

In 1910, the Peace Prize which, in 1909 was divided between August Beernaert of Belgium and D'Estournelles de Constant of France, was awarded to an institution, the International Permanent Peace Bureau at Berne. The prize for literature went to the octogenarian German writer, Paul Johann Ludwig Heyse. The prize for physics was awarded jointly to Johannes Diederick Van der Waals, professor of experimental physics and director of the Physical Institute in Amsterdam and Guglielmo Marconi, the discoverer of wireless telegraphy. The prize for chemistry was given to Professor Otto Wallach, of the University of Göttingen, and the medical prize to Professor Albrecht Kossel of Heidelberg, for pioneer work in the artificial production of organic material.

CHARLES E. MUMFORD,

The Columbian University, Washington, D. C.

Nobert's Test-plates, finely-ruled glass plates so named from F. Nobert, a German optician, used for testing the power of microscopes. The rulings are executed on the under surface of a piece of exceedingly thin glass by means of a diamond point. Some of these ruled plates have the almost incredible number of 225,187 spaces to the inch. As means of testing the power of the microscope they are superior to any other object.

Nobility, in European countries, a certain rank or class of society which possesses hereditary honors and privileges above the rest of the citizens. Such a class is found in the infancy of almost every European nation. Its origin may be attributed to military supremacy, to the hon-

NOBLE — NOBLESVILLE

ers paid to superior ability, or to the guardians or royal rulers of the nation. Among the Romans the patricians originally formed the nobility; but a new order of nobility arose out of the plebeians, consisting of those who had held curule magistracies and their descendants, enjoying the right of having images of their distinguished ancestors. Among the ancient German tribes only obscure traces of hereditary nobility are found. The dignities of the counts, of the Franks, the aldermen and great *thanes* of England, as also of the *jarls* (in England *eorlas*) of Denmark, were accessible to every one distinguished by merit and favored by fortune. In Venice a civic nobility grew up consisting of a series of families who gradually acquired all political power and kept it to themselves and their descendants. In England hereditary nobility, the nobility belonging to the titles of duke, marquis, earl, viscount, and baron, is now entirely personal, though formerly, as a result of the Norman conquest, it was connected with the holding of lands.

In Spain and Italy still the same rank depends in greater measure upon property; and in France and Germany the *de* and *von* of titles points to the same fact. In France and Germany nobility is common to all the members of the noble family, and the German nobility form a very exclusive caste. In France and Germany the nobles long formed a class of petty sovereigns within their own domains. The French Revolution first deprived the nobles of that country of their privileges and exclusive rights, as that of jurisdiction, etc.; and the decree of 19 June 1790 abolished hereditary rank entirely. Under Napoleon I. arose a new hereditary nobility, with the titles of princes, dukes, counts, barons, and chevaliers, which descended to the eldest son. After the restoration of the Bourbons (1814) the ancient nobility reclaimed their former rights and privileges. Nobility was again abolished in 1848, but was restored by Napoleon III. In Norway the parliament abolished nobility by the three successive decrees of 1815, 1818, and 1821.

In Great Britain titles of nobility can only be conferred by the sovereign, and that by patent, in virtue of which they become hereditary. Life peerages also are occasionally conferred. The nobility, as the term is commonly used, consists of those holding the titles already mentioned (or all above the rank of baronet) and their more immediate connections; but if the term were to be used as generally in Europe the gentry would also be included, or all families entitled to bear coat armor. Those of the nobility who are peers of England, of Great Britain, or of the United Kingdom, have a hereditary seat in the House of Lords, while the Scottish peers elect 16 of their number to represent their order, and the Irish peers elect 28 representatives for the same purpose. There is no nobility in America, the Federal Constitution declaring that "No title of nobility shall be granted by the United States; and no person holding any office of profit or trust under them shall, without the consent of Congress, accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign state." Congress sparingly gives its consent for a person in the service of the government to accept a decoration or other mark of honor from another government.

Noble, Alfred, American civil engineer: b. Livonia, Mich., 7 Aug. 1844. He graduated from the University of Michigan in 1870, and then engaged in civil engineering. He was a member of the Nicaragua Canal Board in 1895, of the United States board of engineers on deep waterways in 1897-1900 and of the Isthmian Canal Commission in 1899-1903.

Noble, Sir Andrew, English physicist: b. Scotland 13 Sept. 1832. He was educated at Edinburgh Academy, and is an authority on army ordnance and explosives. He was assistant inspector of artillery in 1859, and since 1860 has been a member of the firm of Sir W. G. Armstrong, Whitworth & Company. He became high sheriff of Northumberland in 1896.

Noble, Annette Lucile, American author: b. Albion, N. Y., 12 July 1844. She was graduated from Phipps Union Seminary in 1863, and has since devoted herself to literature and traveling. She has published: 'Uncle Jack's Executors' (1880); 'After the Failure' (1887); 'The Crazy Angel' (1901); etc.

Noble, Edmond, English author and journalist: b. Glasgow, Scotland, 8 Jan. 1853. He was educated in Lancashire, and entered journalism in 1872 as reporter on the *St. Helen's Newspaper and Advertiser*. In 1882 he became proprietor of the *Liverpool City News*, and was in Russia as correspondent of the *London Daily News*, and other London journals, in 1882-4. He was a foreign editorial writer of the *New York Herald* in 1887, and edited the American edition of 'Free Russia' 1892-4. He has published 'The Russian Revolt' (1885); 'Russia and the Russians' (1900); 'Before the Dawn' (1901).

Noble, Frederick Alphonso, American Congregational clergyman: b. Baldwin, Maine, 17 March 1832. He was graduated from Yale University in 1858, and from Andover Theological Seminary in 1861. He held various important charges until 1901, when he resigned. He has been prominently connected with the leading missionary conferences of his church, and has written: 'Divine Life in Man' (1896); 'Typical New Testament Conversions' (1901); etc.

Noble, John Willock, American lawyer: b. Lancaster, Ohio, 26 Oct. 1831. He was graduated from Yale University in 1851 and engaged in law practice. He was city attorney of Keokuk, Iowa, at the outbreak of the Civil War, when he enlisted and served through the war, rising to the rank of brevet brigadier-general. In 1867-70 he was United States attorney for Missouri at Saint Louis, and in 1869-93 secretary of the interior in President Harrison's cabinet. He has resumed his law practice in Saint Louis.

Noble, in numismatics, an ancient English gold coin, six shillings and eightpence, or 4s. 6d., first struck in the reign of Edward III., 1344. Half-nobles and quarter-nobles were also in circulation at the same period.

Noblesville, nŏ'b'lz-vīl, Ind., city, county-seat of Hamilton County, on the White River, and on the Lake Erie & W. and the Chicago & S. E. R.R.'s; about 18 miles north by east of Indianapolis. It was settled in 1824, and in 1839 was incorporated. It is in an agricultural region and in a natural gas belt. Its chief manufactures are flour, foundry products, and strawboard. It

NOBUNAGA—NODULAR DISEASE

has grain elevators, enameling and carbon works. There is considerable trade in the manufactured articles and farm products. The charter of 1890 provides for a mayor, who holds office four years, and a council. Pop. (1890) 3,054; (1900) 4,792; (1910) 5,073.

Nobunaga, nō-boo-nā'gā, Japanese general and statesman: b. Owari 1533; d. Kyoto 1582. He was son of a soldier and small landholder, and to the little property left him in 1549 by his father rapidly added more, so that in 1559 he had control of the entire province of Owari. Thence, with the assistance of his lieutenant, Hideyoshi, he made bold forays into neighboring provinces. In 1567 he made an alliance with Yoshiaki, younger brother of the lately assassinated shōgun, and, having put him upon the throne in 1568, was appointed vice-shōgun, in which office he put down all opposition, crushed the political power of Buddhism, and encouraged the Jesuit missions, no doubt merely to countervail the influence of the Buddhists. Yoshiaki, attempting an alliance against Nobunaga, was deposed in 1573, and Nobunaga took the powers but not the titles of the shōgunate, thus forwarding the work of political reform. In 1582 one of his lieutenants, angered, says legend, by a practical joke of Nobunaga, turned against him, hemmed him in in a temple in Kyoto, and set fire to the building. Nobunaga committed hari-kari. Consult: Dening, 'Life of Hideyoshi' (1890); Brinkley, 'Japan' (1901).

Noctes Ambrosianae, nōk'tēz ām-brō-si-ā'-nē. See BLACKWOOD, WILLIAM; WILSON, JOHN.

Noctilu'ca, a luminous flagellate protozoan (*Noctiluca miliaris*), extremely abundant throughout all seas, and one of the chief causes of the "phosphorescence" of the waves. It is a spherical animal—large for an infusorian (.02 inch in diameter)—and moves by means of a long stout lash or flagellum, beside which there is a second, very much smaller, lying in the "mouth" region. Its substance is remarkably spongy, and the phosphorescence is said by Allman to have its seat just underneath the tough rind which is its most peculiar characteristic. It represents, with a similar form (*Leptodiscus*), the order *Cystoflagellata*. See FLAGELLATA.

Noctu'idm. See MOTHS; OWLET-MOTHS.

Noct'urne, (1) in art, a painting exhibiting some of the characteristic effects of night light. Whistler has produced various nocturnes which have given rise to considerable controversy. (2) In music, the term denotes a composition in which the emotions, particularly those of love and tenderness, are developed. The nocturne was invented by John Field (q.v.), and has become a favorite style of composition with modern pianoforte composers. Chopin is the most famous of nocturne composers. See CHOPIN; FIELD, JOHN.

No'dal Lines and Points. See NODE; HARMONICS.

Nod'dy, a dark brown tern (*Anous stolidus*), widely diffused through the northern and southern hemispheres, and well known to sailors for its fearlessness, regarded as stupidity, allowing itself even to be taken by the hand; but this is true only of birds rarely or never disturbed by men. The noddy is a rare visitant to northern shores, but is very abundant in warmer climates, as in the West Indies and South Seas, where its

eggs are gathered from certain lonely islets in immense quantities and used as food.

Node, (1) in astronomy, the two points in which the orbit of a planet intersects the plane of the ecliptic; the one through which the planet passes from the south to the north side of the ecliptic being called the ascending node, and the other the descending node. As all the bodies of the solar system, whether planets or comets, move in orbits variously inclined to the ecliptic, the orbit of each possesses two nodes, and a straight line drawn joining these two points is called the line of nodes of each body. It is scarcely necessary to add that as the earth moves in the plane of the ecliptic she has no nodes. The places of the nodes are not fixed points on the plane of the ecliptic, but are in a constant state of fluctuation, sometimes advancing (eastward), and at other times receding (moving westward). This motion is produced by the mutual attractions of the planets, which tend to draw each of them out of the plane of its orbit; and it depends upon the relative positions of the planets with respect to another planet whether that planet's nodes shall advance or recede. (2) In physics, a point in a vibrating body, or system of vibrating particles, where there is no movement. When a body is vibrating, the vibratory motion is conveyed from one place to another by the action of the molecular forces of the particles on one another. If a plate of glass or metal be held in the hand, and a bow be drawn across the edge, particles of fine sand, previously placed on the plate, will arrange themselves in lines, along which it is evident no vibration has taken place. These lines, called nodal lines, generally form geometrical figures. (3) In botany, the joint of a stem, or the part where a leaf or several leaves are inserted.

No'diak, a Papuan animal. See ECHIDNA.

Nodier, Charles, shārl nō-dē-ā. French author: b. Besançon, France, 29 April 1780; d. Paris 27 Sept. 1844. At an early age he proceeded to Strasburg, where he studied under Eulogius Schneider, and, returning to his native district, gave much of his attention to natural history. In 1798 he became assistant librarian at Besançon. Soon drawn into connection with royalist clubs, he wrote with great acrimony against Bonaparte. These philippics subjected him to prosecutions, and even to imprisonment. For several years he lived concealed in the Jura, and then fled to Switzerland, where he supported himself as a corrector of the press until, after many adventures, he returned to France. In 1814 he went to Paris, where Louis XVIII. rewarded him with a title of nobility and the cross of the Legion of Honor. In 1824 he was appointed librarian to the arsenal, and in 1834 admitted a member of the Academy. As a critic he is known by a series of excellent editions of the French classics with notes. As a grammarian and lexicographer he published: 'Dictionnaire des Onomatopées de la Langue française'; 'Examen critique des Dictionnaires de la Langue française'; 'Dictionnaire universel de la Langue française'; and 'Elements de Linguistique.' Among his many other works, many of them fictions of the romantic school, are: 'Stella ou les proscrits' (1802); 'Trilby ou le Latin d'Argail' (1822).

Nod'ular Disease. See SHEEP, DISEASES OR

Noé, Amélie de, i-má-dá dé nō-ā. See CHAM.

Noel, nō'ēl, Baptist Wriothsley, English clergyman. b. Leightmont, Scotland, 10 July 1799; d. Stanmore, Middlesex, 20 Jan. 1873. A brother of the first earl of Gainsborough, he was graduated from Cambridge University in 1826, entered the Anglican ministry and was incumbent of Saint John's, Bedford Row, London. In 1848 he quitted the Establishment for the Baptist fold, became widely known as a Baptist minister in London, and was prominent in philanthropic labors in the metropolis. He published 'Essay on Christian Baptism' (1849); 'The Union of Church and State' (1848); 'Freedom and Slavery in the United States of America' (1863); 'Hymns About Jesus' (1869); etc.

Noel, Roden Berkeley Wriothsley, English poet: b. England 1834; d. Mainz, Germany, 26 May 1894. He was a son of the Earl of Gainsborough. He was educated at Cambridge, and though never a popular poet his work appeals to highly educated readers and is much of it rich in melody, though too voluminous to keep entirely to his best standard. His published volumes include 'Behind the Veil and Other Poems' (1863); 'A Little Child's Monument' (1881); 'A Modern Faust and Other Poems' (1888); etc.

Noel, Thomas, English poet: b. Kirkby-Mallory, England, 11 May 1799; d. Brighton, England, 16 May 1861. He was graduated from Merton College, Oxford, 1824 and was the author of the famous poem 'The Pauper's Drive,' often credited to Hood. Among his other works are: 'The Cottage Muse' (1833); 'Rhymes and Roundelays' (1841).

No'emi, a romance by Sabine Baring-Gould, published in 1895. It is a tale of Aquitaine, during the English occupation, in the early 15th century.

Noetians, nō-ē'shī-ānz. See SABELLIUS.

Noetic Consciousness. See METAPHYSICS.

Nogales, nō-gā'lēs, Mexico, town in the state of Sonora; on the Santa Cruz River, on the boundary between Mexico and Arizona, and on the Sonora Railroad. A United States consular station here.

Nogaret, Stanislas Henri Lucien de, stān-ēs-lās ōn-rē lū-sē-ōā dé nō-gā-rā, French colonist in America: b. Marseilles 1682; d. Paris 1759. He studied law; ran away from college; served in the army in Canada until 1716; and then was sent to Louisiana where he became Bienville's lieutenant in the bloody wars with the Natchez Indians described by Nogaret in his 'Précis des Etablissements fondés dans la Vallée du Mississippi par le Chevalier Le Moyne de Bienville' (1738). From 1735 until his death Nogaret resided in France and acted as director of the Louisiana Company.

Noiré, nwā-rā, Ludwig, German philosophical writer: b. Alzey, Hesse, Germany, 26 March 1829; d. Mayence, Germany, 26 March 1889. He was educated in Giessen and taught for many years in the gymnasium at Mayence, giving himself meantime to philosophical study. He wrote: 'Die Welt als Entwicklung des Geistes' (1874); 'Einleitung und Begründung einer monistischen Erkenntnistheorie' (1877); 'Logos' (1885).

Noisless Powder. See EXPLOSIVES.

Noisseville, nwās-vēl, France, a village five miles east of Metz, celebrated as the scene of Bazaine's attempt to break through the line of German besiegers 31 Aug.-1 Sept. 1870. With 120,000 men and 600 guns, he attacked Mantheyll with 41,000 men and 138 guns, drove him back and took the villages of Montoy, Servigny, and Courcy, but German reinforcements arriving on the second day, Bazaine was compelled to fall back upon Metz.

Nola, nō'lā, Italy, city in the province of Caserta; 16 miles east by north of Naples. It is said to have been founded by the Etruscans before Rome was built, and 313 B.C. it became a part of the Roman territory. It successfully resisted an attack of Hannibal in the Second Punic war. Nola claims to have made, in the 5th century, the first bells used in Christian churches. Giordano Bruno (q.v.) was born in Nola and Augustus died here in 14 A.D. Pop. about 16,000.

Nöldeke, nēl'dē-kē, Theodor, German orientalist: b. Harburg, Germany, 2 March 1836. He was educated at the gymnasium of Lingen, Hanover, and at the University of Göttingen. In 1859 he won the prize offered by the French Académie des Inscriptions with his history of the Koran, which he wrote in French and translated into German in the following year. He was privat-docent at Göttingen in 1861-4 and then was appointed assistant professor there. In 1860-72 he occupied the chair of theology at Kiel and was then called to the professorship of Oriental languages at Strasburg. A scholar of wide attainments he has made a specialty of the Semitic languages and of Oriental philology and history, in which departments he is a leading authority. He is a voluminous writer and much of his work is intended for specialists only, yet much of his writing is intended for the general public and he has contributed to several encyclopædias. He has published: 'Über die Mundart der Mandäer' (1862); 'Die Gedichte des Urwa ibn Alward' (1863); 'Das Leben Muhammeds' (1863); 'Die Alttestamentliche Litteratur' (1864); 'Grammatik der Neusyrischen Sprache' (1868); 'Untersuchungen zur Kritik des Alten Testaments' (1869); 'Mandäische Grammatik' (1874); 'Aufsätze zur persischen Geschichte' (1887); 'Orientalische Skizzen' (1892), translated into English in that year and revised by him; etc.

Nolhac, Pierre de, pē-ār dé nōl-āk, French historian: b. Ambert 15 Dec. 1859. He studied at the French school in Rome, worked for a year in the Bibliothèque Nationale, in 1886 became professor of history and classical philology in the Ecole des Hautes Etudes, and in 1892 was appointed conservator of the Versailles Museum. Among his literary and historical studies are: 'Lettres de Joachim du Bellay' (1884); 'La Bibliothèque de Fulvio Orsini' (1887); 'Erasmus en Italie' (1888); 'Marie Antoinette' (1890); 'Pétrarque et Humanisme' (1892); 'Histoire du Château de Versailles' (1899-1900); and 'Louis XV. et Marie Lezinska' (1901).

Noll, nōl, a name by which Oliver Cromwell (q.v.) was popularly known.

Nolle Prosequi, nōl'ē prō-ā'ē-kwī (to be unwilling to prosecute) in law, is a stoppage of proceedings by a plaintiff, and is an acknowledgment that he has no cause of action. It is

NOLLEKENS — NON-COMMISSIONED OFFICERS

resorted to for the most part when the plaintiff has misconceived the nature of the action, or the party to be sued. In the United States the government—Federal, State or Municipal—through its attorney often enters a *nolle prosequi*, especially where there exists a lack of evidence for the prosecution.

Nollekens, nŏl'ĕ-kĕnz, Joseph, English sculptor: b. London 11 Aug. 1737; d. there 23 April 1823. He was the son of a painter of Antwerp, who had settled in England and after studying sculpture at Rome became very successful in the execution of portrait busts. He modeled busts of George III., Pitt, Canning, and Castlereagh. His finest ideal statue is 'Venus with the Sandal.'

No'ma. See CANCRUM ORIS.

Nom'ada, a general name given roaming or wandering people or tribes without fixed habitations. Nomadic tribes are seldom found to quit their wandering life until they are compelled to do so by being surrounded by tribes in settled habitations, or unless they can make themselves masters of the settlements of a civilized nation. But this change commonly takes place by degrees. Some of the greatest revolutions in history have been effected by these wandering tribes. North Africa, the interior of South America, and the northern and middle parts of Asia, are still inhabited by nomadic tribes. Different tribes, however, possess different degrees of civilization. Some are little better than bands of robbers.

No'marchy, or **Nome**, the largest political division of Greece; a subdivision of a nomarchy is an eparchy, and a subdivision of an eparchy is a demarchy. There are 26 nomarchies in Greece. The government appoints the nomarch who rules or governs a nomarchy. The time which he holds office is indefinite, but the members of the council, who assist him, are elected by the people for a certain definite time.

Nombré de Dios, nŏm'bră dă dĕ'os, Mexico, city in the state of Durango; about 150 miles from the Gulf of California, and 30 miles southeast of Durango, the nearest railroad station. It is situated in a region noted for its extensive deposit of silver ore. Pop. 10,826.

Nome, nŏm, Alaska, city in the western part; on the north shore of Norton Sound (q.v.) at the mouth of Snake River; 14 miles west of Cape Nome. It is the commercial centre of an extensive gold mining district in the western part of the Territory, including a large part if not all of Seward Peninsula, as the gold mining district which contributes to the wealth of Nome increases in extent as new fields are prospected. The placer gold fields, so dependent upon water for their development, are not continuous; rich deposits may have long intervening stretches where as yet no gold has been found. Nome came into existence as a mining camp in 1898-9 when gold was discovered in the creeks and streams of the vicinity, and the value of the beach deposits was recognized. Angelo Heilprin, president of the Philadelphia Geographical Society, is authority for the statement that out of the Nome sands "in barely more than two months" has been taken over \$1,000,000 by the crude method of "rocking." Nome is the shipping point for Council City, second in size to Nome. The tin found in the vicinity of Cape

Prince of Wales, and at Cape York, 90 miles northwest of Nome, is of industrial interest to Nome. Short narrow gauge railroads connect several of the mining camps with the city. The gold output for 1901 was about \$7,000,000. The harbor is closed by ice the greater part of the year, so that the city is active only from June to October. The city government is well organized, with all the departments essential for proper maintenance and operation. The streets are lighted by electricity; it has a good water system, free mail delivery, and many of the modern conveniences found in cities in older settlements of the United States. The population in summer is much larger than in winter. Pop. (1910) 2,600. See ALASKA, RECENT DEVELOPMENT OF.

Nome, Cape. See CAPE NOME.

Nome, (1) in music (especially in ancient Greek) any melody which was made up from or depended on natural or inviolable rules. (2) A province or other political division of a country, especially ancient Egypt and modern Greece. See NOMARCHY.

Nom'inalism, in the Middle Ages, a name of one of two rival schools of philosophy dating from the time of Plato. The discussion arose respecting the nature of our general or abstract ideas, or of "universals." It was contended by some that abstractions—as a circle in the abstract, beauty, right—had a real existence apart from round things, beautiful objects, right actions. This was called realism. Those who held the opposite view were called Nominalists, because they maintained that there is nothing general but *names*; the name "circle" is applied to everything that is round, and is a general name; but no independent fact or property exists corresponding to the name. Specifically the controversy was as to the existence of "universals" or of genera and species, and arose out of a passage in the Latin translation of Porphyry's 'Isagoge.' Roscellinus, canon of Compiègne, in the latter part of the 11th century, was the first advocate of nominalism, and maintained, in opposition to the advocates of realism, that general ideas have no separate entity. He was charged with holding heretical opinions concerning the Trinity, for which he was cited before the Council of Soissons, and condemned 1092 A.D. His first great opponent was Anselm, Archbishop of Canterbury, and later Abelard, who had been a pupil of Roscellinus, modified his master's views into what is known as conceptualism.

Nomina'tion. See CAUCUS.

Nomoc'anon, in the Greek Church, a systematic collection of ecclesiastical laws, including certain secular enactments, especially imperial decrees, which have an ecclesiastical bearing. The most important is the Nomocanon of Photius (883) which was republished at Rome 1842 in the 'Spicilegium Romanum.'

Non-activity. See NEUTRALITY.

Non-com'batants, a term used in warfare for officers and privates charged with administrative duties and who do not fight unless in self-defense.

Non-commissioned Officers, in the army are officers intermediate in rank between the commissioned officers and privates or marines.

NON COMPOS MENTIS—NONPAREIL

They are selected from among the latter, and are generally the most meritorious of these. They vary in rank, and comprise sergeants-major, sergeants, drum-majors, corporals. Their duties are various, but in general it may be stated that they overlook the men when off parade and while in barracks. They can only be reduced to the ranks by the colonel-commandant or by court-martial. A grade of officers above non-commissioned officers are the warrant officers. See ARMY OF THE UNITED STATES.

Non Compos Mentis, *nôn kôm'pôs mên'tis* ("not of sound mind") an expression used of a person who is not of sound understanding. See INSANITY.

Non-Euclidean Geometry. See GEOMETRY.

Non-intru'sionists, those members of the Scotch Established Church who contended for the principle that no minister should be intruded on a parish contrary to the will of the congregation. The name originated in a resolution, bearing this import, proposed by Dr. Chalmers and seconded by Lord Moncrief in the General Assembly of 1833. It was to meet these views that the General Assembly, in 1834, passed the Veto Act, which brought the Church into conflict with the law courts, and produced the disruption from which the Free Church of Scotland came into being.

Non Pos'sumus, an expression said to have been used by Pope Clement VII. in reply to Henry VIII's demand for the dissolution of his marriage with Catharine of Aragon; used in general expression for the refusal of the Roman Catholic Church to yield to the demands of the temporal power.

Non-resistance, Doctrine of, is, that it is unlawful, on religious grounds, to resist the commands of a ruler or magistrate. The New Testament writers urge the necessity of obedience to those in authority, although, as usually understood, this teaching refers only to lawful commands. It has, however, been maintained that obedience is to be rendered to all the commands of a ruler without exception. The doctrine is closely connected with—may indeed be said to proceed from—the doctrine of the divine right of kings. Hobbes maintained the absolute supremacy of kings, and their right to exact unquestioning obedience from their subjects. This view was the outcome of his social contract theory. In modern times the doctrine has become completely exploded.

No'na, or **En'na**, the ninth member of the series of the saturated fatty hydrocarbons, or paraffins. It has the chemical formula C_9H_{20} , and is theoretically capable of existing in no less than 35 different isomeric forms, a number of which have been actually identified. Two of these, having a common specific gravity of about 0.742, and boiling at 266° F. and 277° F., respectively, are known to exist in ordinary petroleum.

Non-confor'mists, those who refuse to join the Established Church in England as by law established. The first Act of Uniformity was passed under Edward VI. 1549. But the term was particularly applied to these clergymen who were ejected from their livings by the Act of Uniformity passed under Charles II. in 1662. Their number was about 2,000. The act required

that every clergyman should be ordained by a bishop; should assent to everything in the Book of Common Prayer; take the oath of canonical obedience; abjure the Solemn League and Covenant; and swear allegiance to the king. The Presbyterians, Independents, etc., refused to conform, and were exposed to persecution. By the Five Mile Act (1665) no dissenting teacher who would not conform, could approach within 5 miles of any corporation, or of any place where he had preached after the act of obligation; and should thus be deprived of all means of subsistence. The term was subsequently widened so as to comprehend not only the pastors but their flocks. On the accession of William III. all was changed by the Toleration Act. Some of those oppressive provisions were revived during the reign of Queen Anne, but were finally repealed in 1718. The name *Non-conformists* was under these altered circumstances changed to that of *Dissenters*. The repeal of the Corporation and Test Acts in 1828 removed the civil disabilities under which Dissenters had previously been placed; and their other grievances, including those in regard to marriage, church rates, burials in parish church-yards, and university tests were subsequently redressed. See PURITANS; DISSENTERS.

Nones, *nônz*, in the Roman calendar, the fifth day of the months January, February, April, June, August, September, November, and December, and the seventh day of March, May, July, and October. The *nones* were so called as falling on the *ninth* day before the *ides*, both days included. See CALENDAR.

Nonius, *nô'n-ûs*, **Marcellus**, Latin grammarian: b. Thubursicum in Numidia at the opening of the 4th century A.D. His '*De Compensiosa Doctrina*,' originally consisting of 20 books, is greatly esteemed on account of its many quotations from earlier writers whose works are lost. The 16th book is no longer extant. Consult editions by Quicherat (1871) and L. Müller (1888); also Nettleship, '*Essays in Latin Literature*' (1885).

Nonjurors, in British history, those who refused to take the oath of allegiance to the government and crown of England at the Revolution, when James II. abandoned the throne. The nonjurors numbered upward of 400 clergy, including one archbishop and eight bishops.

Nonnus, *nôn'ûs*, Greek poet of the 5th century of our era. He wrote the '*Dionysiaca*,' an epic poem in 48 books relating the journeys and expeditions of Dionysus in lively and poetic style, full of taste and learning. He was a Christian and produced a poetic paraphrase of St. John's Gospel. Consult: Ludwig, '*Beiträge zur Kritik des Nonnos*' (1873).

Nonpareil, a small and beautiful finch (*Cyanospiza ciris*) of the South Atlantic and Gulf States. It is nearly related to the indigo-bird (q.v.), and is frequently kept as a cage-bird, especially by the French people of southern Louisiana, who call it *le pape* (the pope). It is about the size of a canary, and, in the male, ultramarine blue over the whole head and neck, excepting a narrow stripe from the chin to the breast, which, with the under parts generally and the rump, is vermillion red; there are touches of green about the shoulders. The female is clear dark green above and yellowish on

the lower surfaces. Its song is a series of melodious warblings, and its nest is placed in bushes and low trees, and contains pearly white eggs marked with purplish and reddish brown.

Nonsense, Fort, in American history, the name of a former fort near Morristown, N. J., projected by Washington to keep his discouraged and famished army from revolting during the winter of 1779-80. The Washington Association of New Jersey erected a memorial stone on the site of the earthworks in 1888.

Non'suit, in law. See **NOLLE PROSEQUI**.

Non'yl, or **En'yl**, in chemistry, the organic radical C_6H_5 , whose hydride is the paraffin nonane (q.v.). Nonyl is analogous in its chemical behavior to ethyl and methyl, and, like these, it cannot exist in the free state. The derivatives of nonyl have been very little studied as yet, because they are of no commercial importance, and their relations are exceedingly complicated, owing to the large number of possible isomeric forms that each of them can have. Several of its alcohols, amines and chlorides have been prepared, however.

Non'ylene, or **En'nylene**, the ninth member of the olefine series of fatty hydrocarbons. It has the chemical formula C_9H_{18} , and is capable of existing in many isomeric modifications. All of these modifications that are known are liquid. One of them, which may be prepared from one of the nonyl chlorides (see **NONYL**), has a specific gravity of 0.853, and boils at 275° F. Another, which occurs in the distillates from bituminous shales, has a specific gravity of 0.753 and boils at 250° F. A third, which occurs among the products obtained by distilling anyl alcohol with zinc chloride, boils at 284° F.

Nootka (noot'ka) Indians, a name given to several North American Indian tribes of the Wakashan family, residing on Vancouver Island. In 1792 they were called Wakash Indians. About 2,500 of them remain, over half of whom are nominally Christians.

Nootka Sound, Canada, an indentation on the west coast of Vancouver's Island. See **VANCOUVER'S ISLAND**.

Nor'bert, Saint. See **PREMONSTRATENSIANS**.

Norchia, nór'che-a, The Biga of, in archaeology, a name given to the remains of a biga, or two-horse chariot, discovered in 1901 in the course of some excavations undertaken by a country builder at Norchia, a small town almost 30 miles north of Rome, in what was once a populous part of Etruria. With it were found a number of bronze vessels and some pieces of pottery, of a character familiar among Etruscan remains. These remains were purchased by the Metropolitan Museum of Art in New York, and placed on exhibition. To set the fragments up it was necessary to reconstruct the original chariot. The wheels alone retained their shape. This entailed a work of great delicacy and difficulty, which was accomplished with great skill.

Nor'cross, Frank W., American trade journalist: b. Bangor, Maine, about 1831; d. Philadelphia 21 March 1903. He removed to New York in 1857, and there founded with J. D. Dexter 'The Shoe and Leather Reporter,' the earliest trade journal, but one, in the country. He published: 'The History of the New York Swamp';

'A Hundred Years' History of the Shoe and Leather Trade in America' (1903).

Nord, nór, France, a northeastern frontier department bordering on Belgium and the North Sea; area, 2,229 square miles. Capital, Lille. The coast, marked by a long chain of sandy bullocks, furnishes the two harbors of Dunkirk and Gravelines. The interior is a monotonous but fertile alluvial flat, intersected by sluggish streams and canals. The department is essentially agricultural, upward of four fifths of the area being under cultivation. The principal mineral is coal. The iron mines are also very productive.

Nordau, nór'dow, Max Simon, German physician and author: b. Budapest, Hungary, 29 July 1849. He studied at the University of Budapest, receiving his degree in 1872; he then traveled for six years, visiting the principal countries of Europe, and in 1878 began the practice of medicine in Budapest. In 1880 he went to Paris, and after two years of study resumed the practice of his profession there. He began his literary career at Budapest before entering the University as contributor and dramatic critic for 'Der Zwischenact'; he subsequently was an editorial writer and correspondent for several other newspapers. His newspaper writings were collected and furnished the material for his earlier books, including 'Pariser Studien und Bilder' (1878); 'Seifenblasen' (1879); 'Vom Kreml zur Alhambra' (1880); 'Paris unter der dritten Republik' (1881), which are mostly criticisms of political and social conditions. In 1883 he published 'Die konventionellen Lügen der Kulturmenschheit' (English translation, 'Conventional Lies of Society'), in which he shows what he believes to be the essential falsity of some of the social, ethical, and religious standards of modern civilization; and in 1892 published 'Entartung,' translated into English under the title 'Degeneration.' This is his best known work and provoked much criticism; in it he maintains that the civilization of the present, the new inventions, and the growth of great cities have resulted in the degeneration of man, especially of the higher classes; that this degeneration is seen particularly in the lowered, and often depraved, standard of literature, art, and music; and that the authors and artists of the day whose work is in accordance with these standards, are themselves mental and moral degenerates. His other works include: 'Paradoxe' (1885; in English, 'Paradoxes'); 'Die Krankheit des Jahrhunderts' (1887; in English, 'The Malady of the Century'); 'Seelen Analysen' (1892); 'Die Drohnenschlacht' (1897); the novel, 'Gefühlsmodie' (1891; in English, 'A Comedy of Sentiment'); and the dramas, 'Der Krieg der Millionen' (1832); 'Das Recht zu lieben' (1893); 'Die Kugel' (1894); and 'Dr. Kuhn' (1898). Dr. Nordau is a Jew and has been one of the prominent leaders of the Zionist movement. An attempt to assassinate him was made in the latter part of 1903.

Nordenfelt, nór'dén-félt, Torsten Vilhelm, Swedish inventor: b. 1842. He received a thorough technical training; from 1862 to 1866 was engaged in promoting the sale of Swedish iron in London; and early in the eighties established in Sweden, England, and France factories for the production of ammunition, machine guns, torpedoes, and submarine torpedo boats. Soon after-

NORDENFELT MACHINE GUN—NORDHOFF

ward with Hiram S. Maxim (q.v.) he formed the Maxim-Nordenfält Company. Oscar II of Sweden named him royal chamberlain in 1885. Nordenfält's best known invention is a machine gun, intended as a defense against torpedo boats, made with from 2 to 12 barrels, from any one of which the supply of ammunition can be shut off without interfering with the other barrels.

Nordenfält Machine Gun. See **ORDNANCE**.

Nordenskiöld, nôr'dên-shêld, Adolf Erik, BARON, Swedish Arctic explorer; b. Helsingfors 18 Nov. 1832; d. Dalby, Sweden, 12 Aug. 1901. He was educated in Finland at the University of Helsingfors by his father, Nils Gustav Nordenskiöld (1792-1865), a mineralogist, with whom he explored parts of the Urala. He was graduated in 1857, and in 1858 became superintendent of the mineralogical department of the Swedish Royal Museum in Stockholm, having been forced to leave Finland by the Russian authorities, who took umbrage at his political views. In all subsequent Arctic expeditions sent out by the Swedish government he took part, accompanying Torrell in 1858 and 1861, and being leader himself in 1864 and in 1868, when he attained to 81° 42', the farthest north at that time reached on board ship. Oscar Dickson, a wealthy gentleman of Göteborg, who had contributed to previous exploration funds, made it possible for Nordenskiöld to explore Greenland in 1870, a preliminary expedition, which, however, made important discoveries of algae and meteorites and penetrated the island farther than had ever been done before. In 1872, after serving two years in the Swedish lower house of parliament, where he allied himself with the Liberal party, Nordenskiöld set out on the fifth Swedish expedition, which wintered in Mossel Bay, whence with a few comrades he pushed north in the spring of 1873 on sledges. In 1875 and 1876 he led the expeditions sent out by Dickson across the Kara Sea and up the Yenesei River, a journey repeated in 1876. These were mere preparations for his great exploit in 1878-9, when he circumnavigated the Eurasian continent; leaving Karlskrona 22 June 1878; wintering in the ice near Bering Strait, after a successful northeast passage, thus accomplishing a project planned three centuries before; reaching Yokohama 2 Sept. 1879, and returning to Europe by the Suez Canal. In 1883 he again explored Greenland from the west coast, beating his previous record of the farthest inland. The remaining years of his life were spent in the study of early cartography, his publications in this field being 'Periplus, an Essay on the Early History of Charts and Sailing Directions' (1897); an edition of Marco Polo, in French with facsimile (1892); 'Bidrag til Nordens äldsta historia' (1892), in honor of the American Columbian celebration, and accompanied by the earliest maps of North America. Most of his important explorations were also described by his pen. Consult: Leslie, 'Arctic Voyages of Nordenskiöld' (1880); and the 'Life,' in Swedish, by Andersson (1901).

Nordenskiöld, Gustav, Swedish explorer, son of A. E. Nordenskiöld (q.v.); b. Stockholm 1868; d. Mörsill 6 June 1895. He explored Spitzbergen in 1890 and the Colorado cañons in 1891, and described the latter in a work translated by Morgan under the title 'The Cliff Dwellers of the Mesa Verde' (1893).

Nordenskiöld, Nils Otto, Swedish explorer and geologist, nephew of A. E. Nordenskiöld (q.v.); b. Småland 6 Dec. 1869. He was educated at Upsala, where he was graduated with a doctor's degree in 1894. In 1895-7 he accompanied the scientific expedition to Patagonia under Ohlin; in 1898 traveled through the Klondike; in 1900 was a member of the Danish expedition under Amstrup to the eastern coast of Greenland; and in October 1901 left Göteborg on the Antarctic to explore the south polar regions. His ship was sunk in Erebus and Terror Gulf in the early part of 1902, and he and his men encamped on Paulet Island, whence they were rescued by the Uruguay, a gunboat sent out by the government of Argentina.

Norderney, nôr'dêr-nî, Germany, one of the East Friesian Islands, three miles from the coast of Germany and belonging to the province of Hanover. It is about eight miles long and a little over one mile wide. It is treeless, covered with dunes which are from 10 to 75 feet in height. At the southwest extremity is a village which is protected from the sea by a wall, and the lighthouse in the centre of the island may be seen many miles. The island is the most important of the group on account of being a favorite sea-bathing place. Pop., permanent, about 3,878.

Nordhausen, nôr'd'how-sên, Germany, city in the province of Saxony, on the Zorge, 40 miles north-northwest of Erfurt. It is at the base of the Harz Mountains and the west end of the fertile "Goldene Aue," that is, "golden plain." It has 70 large distilleries of corn brandy, "Nordhäuser schnaps," tanneries, chemical works, and tobacco factories. A quaint town-hall, a Gothic cathedral, and the Church of Saint Blasius, which has two paintings by Lucas Carnach, are all of interest.

Nordheimer, nôr'd'hîm-êr, Isaac, American Orientalist; b. Memelsdorf, Germany, 1809; d. New York 31 Nov. 1842. His fondness for learning was early displayed and his maturer education was at Würzburg and Munich, where he gained his degree in 1834. In 1835 he came to New York and was instructor in sacred literature in Union Seminary (1838-42), and professor of Hebrew at the New York University (1836-42). His 'Hebrew Grammar,' an elaborate work in two volumes, appeared in its 2d edition in 1842. His other works include: 'A Grammatical Analysis of Scripture or a Chrestomathy' (1838); 'A Philosophy of Ecclesiastes' (Biblical Repository July 1838). He left in MSS. valuable grammars of Syriac and Arabic.

Nordhoff, nôr'd'hôf, Charles, American journalist and author; b. Erwitte, Westphalia, Prussia, 31 Aug. 1830; d. San Francisco, Cal., 15 July 1901. He came to the United States with his parents in 1835, and in 1843 was apprenticed to a printer in Cincinnati. In 1844 he joined the United States navy and served three years, in which time he made a voyage round the world. He continued to go to sea in merchant, whaling, and fishing vessels until 1853, and was then employed in newspaper offices, first at Philadelphia, and later at Indianapolis. From 1857 to 1861 he was engaged in editorial work in a New York publishing house; and from 1861-71 was on the staff of the New York Evening Post;

NORDICA — NORFOLK

and also contributed to the *New York Tribune*. From 1871 to 1873 he traveled in California and Hawaii, and in 1874 became Washington correspondent for the *New York Herald*. He has described his experiences as a sailor in his 'Man-of-War Life' (1855); 'The Merchant Vessel' (1855); 'Whaling and Fishing' (1856); and 'Nine Years a Sailor' (1857). His sociological and political writings include 'Secession is Rebellion' (1860); 'The Freedmen of the South Carolina Sea Islands' (1863); 'America for the Free Working Men' (1865); 'Politics for Young Americans' (1875), and 'The Communitistic Societies of the United States'; this last is a description and history of different communistic colonies, and is a valuable contribution to descriptive sociology. His other works are: 'Stories from the Island World' (1857); 'Cape Cod and All Along Shore' (1868); 'California for Health, Pleasure, and Residence' (1872); 'Northern California, Oregon, and the Sandwich Islands' (1874); 'The Cotton States in the Spring and Summer of 1875' (1876); 'God and the Future Life' (1881); and 'Peninsular California' (1888).

Nordica, nór'di-ka, **Lillian**, American opera singer: b. (LILLIAN NOKON) Farmington, Maine, 1859. She studied in the Boston Conservatory and under O'Neill made her first appearance in 1876 as a concert artist, in 1878 went to Europe with Gilmore's Band, studied at Milan under Sangiovanni, and made her operatic début at Brescia in 'Traviata.' Her success was great; she was immediately engaged for the Imperial opera at Saint Petersburg, and after two years there appeared in Paris in 1882. In the same year she retired from the stage to marry Frederick A. Gower, whom she sued for divorce in 1885, but who disappeared at about the time of the suit, probably having been killed in a balloon accident. She first appeared in London in 1887, and in New York in 1895. In 1894 she played Elsa in 'Lohengrin' at the Wagner Theatre in Baireuth, and in 1896 married the Hungarian tenor, Doehme, who took the title role in 'Parsifal' at Baireuth in 1894. She obtained a divorce from him in 1904. Her repertoire is large and she is especially successful in Wagnerian opera and in 'Les Huguenots' and 'Aida.'

Nördlingen, nörd'ling-ën, Germany, town in the western part of Bavaria; on the Eger River, 75 miles northwest of Munich. Its history dates back to the year 900, and some of the buildings still remaining bear evidence of an even earlier date. Two of the decisive battles of the Thirty Years' war were fought in Nördlingen; one 16 Sept. 1634, where Ferdinand, the king of the Romans, was successful, and South Germany was freed from foreign rule; and the other 13 Aug. 1645 between the Imperial forces and the French,—the French were victorious. Nördlingen has considerable manufacturing interests; linen and woolen goods, carpets, leather, agricultural implements, furniture, and toys are among the manufactures. It has schools of note and a large library.

Nordmann, Johannes Rumpelmaier, yô-hân'nës room'pêl-mi-ër nört'mân, Austrian writer: b. Landersdorf, Austria, 13 March 1820; d. Vienna, Austria, 20 Aug. 1887. He was an actor in early life, but after the success of his first book 'Aurelie,' a volume of poems pub-

lished in 1847, he devoted himself to travel and literature. He wrote: 'Zwei Frauen' (1850); 'Ein Wiener Bürger' (1860); 'Frühlingsnächte in Salamanca' (1880); etc.

Nordstrand, nörd'strânt, Germany, an island belonging to the North Frisian group, in the North Sea; area, about 21 square miles. Prior to 1634 the area was about 210 square miles; but that year a flood swept over the island, destroying the greater part of the land and drowning over 6,000 people. Many people on the islands of the vicinity were drowned. Pop. about 3,000.

Nore, nôr, a river in Ireland which has its rise in the mountains in the northeastern part of Tipperary, flows northeast into Queens County, then southeast through Kilkenny, and joins the Barrow River about two miles above New Ross. It is navigable for steamers of considerable size as far as Inistoge about 20 miles from Waterford Harbor, and smaller craft to Thomastown. Kilkenny is the largest city on its banks.

Norfolk, nôr'fôk, **Charles Howard**, 11TH DUKE OF, English politician: b. 5 March 1746; d. London 1815. Breaking with the traditions of his family, notably his father, a Roman Catholic and author of pamphlets on penal laws against the Catholics, the son became a Protestant and a Whig; sat in Parliament 1780-4; became lord of the treasury in the Portland Cabinet in 1783; and was dismissed in 1798 from the lord-lieutenancy of the West Riding for toasting the "sovereign English people" in terms displeasing to the Crown. At his death the title passed to Bernard Edward Howard, the first Roman Catholic lord to sit in the House after the Act of Emancipation.

Norfolk, **Henry Granville Fitzalan Howard**, 14TH DUKE OF, English politician: b. 7 Nov. 1815; d. Arundel Castle, Sussex, 25 Nov. 1860. He studied at Trinity College, Cambridge; became a zealous Whig and was always an ardent Catholic. He was a member of the House of Commons from 1837 to 1852, then breaking with his party on the Ecclesiastical Bill of 1850; spent several years in Paris, where he was known as a friend of Montalembert; and in 1856, upon his father's death, entered the House of Lords, where he vigorously opposed Palmerston. He wrote various pamphlets on the Catholic question and the 'Lives of Philip Howard, Earl of Arundel, and of Anne Dacres, His Wife' (1857).

Norfolk, **Henry Howard**, 6TH DUKE OF, English nobleman, friend of Evelyn, the diarist: b. 12 July 1628; d. Arundel, Sussex, 11 Jan. 1684. He was a younger son of the 2d Earl of Arundel, lived abroad until the Restoration, and in 1667 presented the Arundel Library to the Royal Society and the famous Arundel marbles to Oxford University. He was envoy to Morocco in 1669 and succeeded his brother as duke in 1670. Consult Evelyn, 'Diary.'

Norfolk, **Henry Howard**, 7TH DUKE OF, English politician, son of the 6th Duke: b. 11 Jan. 1655; d. London 2 April 1701. He studied at Magdalen College, Oxford; became lord-lieutenant of Norfolk, Berkshire, and Surrey; and was so strong a Protestant that in spite of his personal attachment to James II., he signed the petition for the Convocation Parliament in 1688 brought over the eastern counties to William of Orange, and was made privy councillor in 1689.

NORFOLK

Norfolk, Henry Fitzalan Howard, 15TH DUKE OF, English politician: b. Carlton Terrace 27 Dec. 1847. He succeeded to the title in 1860 upon the death of his father, whom he resembles in his zeal for the Roman Catholic Church. He is president of the Catholic Union of Great Britain; acted as special envoy to the Pope in 1887; with the Unionists he opposed Gladstone's Home Rule programme; and from 1895 to 1900 was postmaster-general. He served in the South African war.

Norfolk, John Howard, 1ST DUKE OF, English admiral, supporter of the House of York: b. about 1430; d. Bosworth, Leicestershire, 22 Aug. 1485. He was a great-grandson of Sir William Howard, founder of the family and chief justice of common pleas under Edward I. and Edward II. He served in France, was elected to the Commons in 1455 by the interest of John Mowbray, last duke of Norfolk of that name, thus becoming allied to the House of York. He was knighted upon the accession of Edward IV., fought again in France and against the Lancastrians, and in spite of this was made a baron by Henry VI. He became a lieutenant of Richard III., who made him duke of Norfolk, earl marshal, and admiral of England in 1483; and fighting for Richard at Bosworth he was killed. The title of Duke of Norfolk revived for him had been held by the Mowbrays, from whom he was descended on the distaff side.

Norfolk, Thomas Howard, 2D DUKE OF, English soldier and statesman, son of John Howard, 1st Duke of Norfolk (q.v.): b. 1443; d. Framlingham, Suffolk, 21 May 1524. Like his father he fought for Edward IV. at Barnet (1471) and for Richard III. at Bosworth (1485), but in 1514 recovered his attainted title, becoming one of the most trusted generals of the day. He put down the Yorkshire rising of 1489, defeated the Scotch at Flodden (1513), and on the "Evil May Day" of 1517 repressed with terrible severity a riot in London. His entire subservience to the Crown was shown by his concurring in the condemnation of Buckingham for treason, after acting as lord high steward of the court which tried his friend.

Norfolk, Thomas Howard, 3D DUKE OF, English statesman, son of 2d Duke (q.v.): b. 1473; d. Kenninghall, Norfolk, 25 Aug. 1554. He married Anne, daughter of Edward IV.; served in the navy and in 1513 under his father at Flodden. He opposed the policy of Wolsey and angered the king against him; was less successful in his opposition to Thomas Cromwell; and in 1546 with his son Henry, Earl of Surrey, was accused of high treason. He was condemned to death and rescued only by the death of Henry VIII. He remained in the Tower during Edward VI.'s reign; but was restored to favor under Mary; and in his 81st year showed equal bravery and rashness in leading the forces against Wyatt. His grandson THOMAS HOWARD, 4th Duke of Norfolk, son of the Earl of Surrey: b. 1536; d. Tower Hill 2 June 1572; became duke in 1554; gave largely to the foundation of Magdalene College, Cambridge; was sent to Scotland in 1568 to inquire into affairs there; attempted to marry Mary, Queen of Scots; and as head of the English nobility played a prominent part in the Ridolfi plot in her behalf. He was tried for treason and executed.

Norfolk, Thomas Mowbray, 1ST DUKE OF, (of the first creation), English statesman: b. about 1366; d. Venice 1399. He was elected to Parliament in 1383; served in Scotland in the following year; joined in the prosecution of the favorites of Richard II. by the Merciless Parliament; but was soon reconciled to the king and assisted him greatly in his tyrannical policy toward the nobles. Norfolk arrested Gloucester, Arundel and Warwick, and when bidden to produce Gloucester for trial he said that the prisoner was dead, and very possibly he was responsible for Gloucester's death. He was made Duke of Norfolk in the same year, 1397, but in 1398 was accused of treason and banished from England.

Norfolk, Va., city, port of entry, and United States naval station in Norfolk County; the second largest city of Virginia; on the Elizabeth River, which is an arm of the Chesapeake Bay, the Albemarle and Chesapeake Canal, and Dismal Swamp Canal. It is 116 miles by water and 90 miles in a direct line southeast of Richmond, on the Atlantic Coast Line railroad, the Seaboard A. L., the Chesapeake & O., the Norfolk & W., the Norfolk & S., the Southern and the New York, P. & N. R.R.'s. Portsmouth and Berkley, which are practically a part of Norfolk, are just across the Elizabeth River.

Topography and Climate.—The city covers an area of about four square miles and is laid out on rather level ground. The climate is genial, being tempered by the Gulf Stream, which runs nearer the shore off Capes Henry and Hatteras than at any other point along the Atlantic coast.

Public Buildings.—Among the prominent buildings here are Saint Paul's Church, built in 1737; Public Library (12,000 volumes), Carnegie Library, City Hall, Custom House, Saint Vincent's Hospital, Protestant Hospital, Post-office, Norfolk Mission College; upward of 30 churches, an academy for young ladies, an institution for colored students, and there is a beautiful public park embracing 95 acres.

Government.—Under the revised and amended charter of 1884, Norfolk is governed by a mayor, elected every four years, and a city council, with two branches, select and common. The administrative officers elected by popular vote include city treasurer, attorney, street inspector, revenue commissioner, collector of taxes. The school trustees are elected by the city councils. The cost of maintenance for the city departments amounts to \$600,000 annually, the principal items being interest on debt, \$175,000; fire department, \$50,000; schools, \$60,000; street, sewer and drain department, \$90,000, and police department, \$73,000. The municipal waterworks were built in 1872 and cost \$1,236,000. There are 60 miles of street mains in the system. In 1903 the assessed valuation of the city was \$30,487,200.

The Naval Station.—Norfolk is 8 miles distant from Hampton Roads and 17 miles from the Atlantic Ocean. Norfolk and Portsmouth, on the opposite side of the Elizabeth River, constitute the largest naval station in the United States. The Norfolk navy yard is located at Portsmouth. The coaling station here handles over 2,500,000 tons annually. The harbor is commodious, accessible for the largest warships

NORFOLK ISLAND—NORMAL COLLEGE OF NEW YORK

and has a main channel 30 feet deep. The defenses include Fortress Monroe.

Customs.—There is a United States Customs District here, embracing both Norfolk and Portsmouth. The foreign trade in 1900 was represented by imports valued at \$318,401 and by exports to the amount of \$11,505,000; in 1901 the imports were \$504,000; exports \$10,308,000; 1902 imports \$501,501; exports \$7,119,243; 1903, exports \$9,297,482; imports 1903, \$516,603.

Trade and Commerce.—Norfolk is the terminus of many steamship lines, transatlantic and coastwise, and has a large boat traffic with the interior by canal. It is already an important commercial centre and is growing rapidly in this direction. The commerce of the port includes lumber, coal, grain, cotton, peanuts, oysters, fruit and vegetables. It is the leading peanut market of the world, is the fourth cotton port of the United States, with a business of 600,000 bales annually; an oyster trade of \$2,500,000 and a trucking business of \$6,000,000. Norfolk has 2 national banks, 6 state banks, chamber of commerce, board of trade, cotton exchange, real estate exchange. The Union stock yard here has an annual business of \$2,000,000.

Manufactures.—Many large manufactories were established here in 1901, 1902 and 1903. In 1909 the manufactures represented capital to the amount of \$10,744,000, with a production valued at \$10,341,000. The industries include cotton knitting-mills, cotton compress-mills, fertilizer factories, ship yards, tobacco and cigar factories, iron foundries, machine shops, steel works, carriage and wagon shops, lumber mills, silk mills, barrel, box and crate factories, brick yards, breweries, bottling works, grain elevators, electric supply works and numerous minor concerns. There are gas and electric light plants here, an electric traction system and daily and weekly newspapers.

History.—The town of Norfolk was first settled in 1680. It was bombarded and nearly destroyed by the British under Lord Dunmore, 1 Jan. 1776. In 1736 the town was incorporated as a borough and was chartered as a city in 1845. The city suffered severely in 1855 from an epidemic of yellow fever. During the Civil War, in April 1861, General Taliaferro entered the city with a large body of Virginia troops. In May 1862, the Federal army took possession of the city and during the interval from April 1861 to May 1862 the city was the chief Confederate naval station.

Population.—In 1860 Norfolk had a population of 14,620; (1880) 21,066; (1890) 34,871; (1900) 46,624. Census of 1910, 67,452. The three cities of Norfolk, Portsmouth and Berkley, which practically form one municipality, have an aggregate population, within a radius of three miles, of 118,000.

Bibliography.—Burton, 'History of Norfolk' (1877); Forrest, 'Historical and Descriptive Sketches of Norfolk and Vicinity' (1853); Lamb, 'Our Twin Cities of the 19th Century' (1888). W. H. Lumsden,

Secretary Chamber of Commerce, Norfolk, Va.

Norfolk Island, in the Pacific Ocean, 400 miles northwest of North Cape, New Zealand, nearly midway between that colony and New Caledonia, and about 800 miles east of Australia,

is six miles long, and has an area of 8,528 acres, rising in Mount Pitt to a height of over 1,000 feet. The climate is healthful, and the soil fertile and well watered; distinctive features of its flora are the Norfolk Island pine, growing to a height of 200 feet, and the Norfolk Island cabbage, a dwarf pine. Norfolk Island was discovered by Cook in 1774. Between 1788 and 1805, and again between 1826 and 1855, it was a penal settlement for convicts sent from New South Wales. In 1856 many of the inhabitants of Pitcairn Island (q.v.) were transferred hither by the British government. The people govern themselves, under the superintendence of the government of New South Wales, but are indolent, and, owing to intermarriage, a decaying race; they fish, farm, and supply provisions to passing vessels.

Norfolk Island Pine. See **ARAUCARIA**.

Norfolk Spaniel. See **SPANIEL**.

No'ria, a hydraulic machine used in Spain, Syria, Egypt, and other countries for raising water. It consists of a water-wheel with revolving buckets or earthen pitchers, but its modes of construction and operation are various. As used in Egypt it is known as the *sakieh*. These machines are generally worked by animal power, though in some countries they are driven by the current of a stream.

Noriac, Jules, zhûl nô-rê-âk, pseudonym of Claude Antoine Jules Cayron: b. Limoges, France, 1827; d. Paris, France, 1 Oct. 1882. His novels have won a high reputation and among the most widely known are: 'The Countess of Bruges' (1878); 'The Chevalier de Cerny' (1879); etc.

Normal, nôr'mal, Ill., city in McLean County; at the junction of the Chicago & A. and the Illinois Central R.R.'s; two miles northeast of Bloomington and about 60 miles northeast of Springfield. It was settled about 1840, incorporated in 1850, and chartered as a city in 1867. It is in a productive agricultural region in which considerable attention is given to the cultivation of fruit and nursery stock and to the raising of Norman and French draft horses. It has canning factories, novelty works, and a large trade in farm products, nursery stock, and horses. It is the seat of the Illinois State Normal University and the Illinois Soldiers' Orphans' Home. It has five churches, graded schools, and a library. The bank has a capital of \$100,000. The government is administered under special charter and is vested in a president and a council of five members, all elected annually. Population of the city is about 4,000.

B. H. McCANN,
Editor 'The Advocate.'

Normal College of the City of New York, founded in 1869, for the training of teachers. The first attempt in New York city to provide public means for teachers to procure professional training was in 1856, when a daily normal school was established, which remained in existence only three years. This was followed by the Saturday Normal School, which proved a source of inspiration to the teachers, and made them strong advocates for more thorough professional work. In 1869 the Normal and High School for young women was established by the Board of Education; in 1870 the name was

NORMAL SCHOOL—NORMAN FRENCH

changed to Normal College. Graduates of grammar grades were then admitted and the course was for three years. The first president was Thomas Hunter; the present head of the school is George S. Davis. The board of trustees consists of the president of the college and the Board of Education of the city public schools. The entrance requirements and the course of study have been raised, and now the institution has a professional course of six years and a collegiate course of seven years, with power to grant degrees. It has a model kindergarten and a model elementary school, an excellent library and five well equipped laboratories. From 1870 to 1910 there have been about 12,000 graduates. Of this number 1,870 were graduated between 1870 and 1880; 2,517 between 1880 and 1890; and 3,379 between 1890 and 1900. A large number of the teachers in New York city are graduates of this college.

Normal School, Manila, established in 1901 by the superintendent of public education for the Philippines. From 10 April to 10 May 1901, a preliminary term of school was conducted under the direction of the superintendent of schools for the city of Manila. Arrangements were made to secure favorable rates of transportation for teachers distant from Manila, and students came from all parts of the archipelago. There were in attendance 600 students, 10 per cent of whom spoke English. Considerable attention was given to subject matter. The average daily attendance was 98 per cent. Many of the pupils remained as regular attendants at the normal school; and the work was most satisfactory during 1901 and 1902, although subject matter was given much more attention than methods. A practice school, well equipped, is one of the strong features. In 1903 there was a large class sufficiently advanced in English to begin regular professional work. The method department was placed in charge of Gertrude Robinson, a teacher from the Indiana State Normal at Terre Haute. The classification in the practice school is first based almost wholly upon ability to speak, read, and write English. The number enrolled in the regular normal department up to 1 Jan. 1902 was 310. The number of provinces represented was 24.

In conjunction with the Manila Normal School there are five tributary normal schools: at Vigan, province of Ilocos Sur; Nueva Cáceres, province of Camarines Sur; Iloilo, province of Panay; Cebu, province of Cebu; and Zamboanga, province of Mindanao. The pupils spend three years in the provincial school and then one year of final training in the Manila school.

In the capital of each province, a normal school is held during the long vacation; attendance is required of all the native teachers. The division superintendent in each district has charge of the vacation normal school held in his district. This vacation normal school must continue four weeks. The normal school at Manila is the head centre for all the public method schools of the archipelago.

Norman, nôr'man, Henry, English traveler and author: b. Leicester, England, 19 Sept. 1858. He was graduated from Harvard in 1881

and later studied at Leipsic. In 1882 he began the public agitation for the preservation of Niagara Falls, which resulted in the purchase of land on both sides of the Falls by the State of New York and the Dominion of Canada for use as a public park. He was for several years on the editorial staff of the *Pall Mall Gazette*; and in 1895 became assistant editor of the London *Daily Chronicle*, resigning that position in 1899; he has also been London correspondent of the *New York Times* and *Chicago Tribune*. He has traveled widely in the United States and Canada, and also in Japan, Russia, Siberia, Central Asia, Korea, China, Siam, the Malay Peninsula, Egypt and the Balkans. In 1902 he founded the 'World's Work,' an illustrated monthly of which he has since been editor. In 1900 he was elected to the British Parliament from South Wolverhampton. He has written 'An Account of the Harvard Greek Play' (1881); 'The Preservation of Niagara Falls' (1882); 'The Real Japan' (1892); 'The Peoples and Politics of the Far East' (1895); 'The Near East' (1899); 'All the Russias' (1902); and 'Delhi' (1902).

Norman, Okla., city, county-seat of Cleveland County; on the Atchison, T. & S. F. railroad; about 48 miles south of Guthrie and 30 miles south of Oklahoma. It is in an agricultural region in which the cultivation of wheat and cotton, and cattle-raising are the chief occupations. The principal manufactures are flour, cottonseed-oil, and ice. It has considerable trade in wheat, flour, cotton, cottonseed-oil, and live-stock. It is the seat of the University of Oklahoma (q.v.) and it has the Territorial Insane Asylum. There are 11 churches and two public schools. The two banks have a combined capital of \$100,000. The government is vested in a mayor and a board of aldermen of eight members. Pop. 3,100.

Editor, 'Democrat Topics.'

Norman Architecture. See **ARCHITECTURE.**

Norman Conquest, in English history, the successful attempt made by William of Normandy in 1066 to secure the English crown from his rival Harold, son of Earl Godwin. It was no real conquest of the land and people by an alien race, but rather resembled in its chief characteristics the accession of William of Orange to the throne in 1688. Any immediate evil effects were more than counterbalanced by the advantages which it conferred on England, such as the better organization and greater mastery of law of the Normans; the bringing of England more into touch with European politics, and the consequent beginning of her ever-widening foreign relations; the repression of internecine strife and the greater security of life and property; the great impetus given to architecture and to many of the industrial arts; and finally its great influence on the development of the old English language into modern English. See **ENGLAND, History.**

Norman French, the language spoken by the Normans at the time of the Conquest. It continued to be the legal language of England till the reign of Edward III., and certain phrases are still employed on particular state occasions. It exercised a considerable influence on the Anglo-Saxon, and is still spoken among the

NORMAN LAW -- NORMANS

native population of the Channel Islands (q.v.), the remnant of the Norman possessions belonging to Great Britain. See **NORMANDY**.

Norman Law. See **LAW**; **NORMANDY**.

Normanby, nôr'man-bî, Constantine Henry Phipps, 1st Marquis of, English statesman: b. England 15 May 1797; d. South Kensington, England, 28 July 1863. He was educated at Trinity College, Cambridge and in 1818 entered Parliament, sitting for Scarborough. In 1832 he was appointed captain-general and governor of Jamaica and in 1835 was made lord-lieutenant of Ireland, where he was extremely popular. He was secretary of war and of the colonies in 1839 and later was transferred to the home secretaryship which he occupied until 1841. He wrote: 'The English in Italy' (1825); 'A Year of Revolution' (1837); 'Vindication of the Duke of Modena' (1861); and several novels, one of which was 'The Contrast' (1832).

Normand, nôr'mand, Henrietta Rae, English painter: b. London 30 Dec. 1859, daughter of T. B. Rae; married Ernest Normand, painter, 1884. She was educated in London art schools, and was awarded a medal at the Paris and Chicago Universal Expositions. Since 1880, when she first exhibited at the Royal Academy, she has been represented there every season. Some of her most important pictures are 'Ariadne' (1885); 'A Naiad' (1886); 'Eurydice' (1886); 'Death of Procris' (1889); 'Ophelia' (1890); 'Apollo and Daphne' (1895); 'Diana and Callisto' (1899); 'Sir Richard Whittington and his Charities,' a fresco for the Royal Exchange (1900).

Normand, Jacques Etienne, zhâk a-tê-ên nôr'mân, French communist: b. Abbeville, France 1809; d. San Antonio, Texas, 1867. He was a Saint Simonist, and during the revolution of 1848 in France, petitioned the legislature for permission to establish a communistic colony; he was banished from France when Louis Napoleon became president, and came to the United States. Buying considerable land near San Antonio, Texas, he established a communistic colony called Réunion, which prospered for a time, but which was finally suppressed by the Texas legislature. While trying to establish another colony, he was arrested and imprisoned. He wrote 'Principes de Socialisme' (1846); 'Théorie de la Commune Naturelle' (1855); 'Théorie de la République Communiste Universelle' (1860).

Normandy, nôr'man-dî, France, an ancient province bordering on the English Channel, now divided into the departments of Seine-Inférieure, Eure, Orne, Calvados, and Manche. It is a fertile region, with well-cultivated fields and fruitful orchards, and the people are intelligent and industrious, ranking among the best and most energetic of French provincials. Under the Romans this portion of the country formed part of *Gallia Lugdunensis Secunda*; after the Franks' invasion it made a constituent part of the kingdom of Neustria, and was given by Charles the Bald to the Duke of Paris. From the middle of the 9th century its coasts were harried by the vikings or Northmen (see **NORMANS**), who early in the 10th century established themselves in such force along the Seine that Charles, king of the Western Kingdom, was glad to arrange a treaty with their leader

Rolf (Rollo, Rou) at Clair-sur-Epte in 912, practically ceding the region which henceforth was known as Normandy. Its capital was Rouen, and it comprised Upper Normandy, with the towns of Dieppe, Evreux, Harfleur, Havre, Honfleur, Lisieux, Rouen, and Yvetot, and Lower Normandy with Caen the chief town, Alençon, Auranches, Bayeux, Cherbourg, Coutances, Falaise, Granville, and Saint Lô. Rollo's most distinguished successor was William I, Duke of Normandy, who invaded England in 1066, and established a Norman dynasty, thereby uniting Normandy with the latter country. Philip Augustus conquered Normandy in 1204, the French holding it till 1417, when it was recovered by the English, who held it till 1450, when it was finally wrested from them by Charles VII. The Channel Islands (q.v.) are a remnant of the Norman possessions still belonging to the descendants of the Norman kings of England, where down to the present day the law administered in the royal courts is virtually the *Grand Coutumier de Normandie*, or the old customary law of Normandy. One feature survives in the Cry of Haro. This ancient customary law of Normandy seems to have been collected in writing on three separate occasions. The earliest collection was apparently written down by private persons in 1200 and about 1220, and had no official character; the third collection (1585) is a revised edition of the second, the *Grand Coutumier*, completed early in the 14th century. Consult: Freeman, 'Norman Conquest' (1877); Palgrave, 'History of Normandy' (1878); Spence, 'Dreamland in History' (1890).

Nor'manna, or **Northmen**, a general name given the people of ancient Scandinavia, or Norway, Sweden, and Denmark. This name was given to them in the Netherlands, in Germany, and France, in Great Britain they were called Danes. They were fierce and warlike tribes, who made piratical expeditions to all parts of the European seas, plundering by land and by sea, and often overrunning large tracts of country, in which they practised every enormity. "They had scarcely any inducements," says Mackintosh, the English historian, "to spare countries which they visited only to plunder, and where they did not hope to dwell; they were less than others liable to retaliation, and they had neither kindred, nor family, nor home. They were, perhaps, the only barbarians who applied their highest title of magistracy to denote the leaders of piratical squadrons, whom they termed *vikingr* or *sea-kings*. Not contented with their native and habitual ferocity, some of them sought to surpass their companions by working themselves into horrible and temporary insanity." *Vikingr* does not, however, mean sea-kings, but is derived from *vik*, a bay or creek. The poverty of their country compelled them to adopt this means of subsistence, and their religion inspired them with a love for daring enterprises, since it taught them that warriors fallen in battle were admitted to Valhalla, the northern paradise.

In 795 some Norwegians established themselves in the Farøe Isles and in Orkney; toward the middle of the 9th century they founded the governments of Novgorod and of Kiev, in Russia; and after the discovery of Iceland certain powerful Norwegian families, taking refuge from the

persecutions of Harold, king of Denmark, settled in that island. The Northmen began their piratical excursions in the first part of the 9th century, and soon covered the sea with their boats, and ravaged the coasts of England, Germany, Friesland, Flanders, and France. Under the feeble reigns of Charles the Bald and Charles the Fat they ascended the rivers to the very heart of France, and plundered Paris itself. It became necessary to purchase their retreat with gold. Their incursions into France were afterward renewed, and Charles the Simple was obliged (912) to cede to them a part of Neustria, which was afterward called, from them, *Normandy* (q.v.), and to give his daughter in marriage to Rollo, their chief. Rollo embraced the Christian religion, was baptized under the name of Robert, and became the first Duke of Normandy, and a vassal of the King of France. His followers received the religion of their leader, and abandoned their roving and piratical habits; though they still retained, as also did their descendants for a long time, marks of their Scandinavian origin, and that warlike ardor which had rendered them so terrible to those against whom they directed their attacks. Great Britain was, for about two centuries, desolated by the Danes, as the Northmen were there called. Egbert, in the beginning of the 9th century, had no sooner made some approaches toward a regular government, and the establishment of tranquillity, than the "Scandinavian heathens," as the Saxons termed them, made their appearance. Alfred (871-901) finally delivered the country from the invaders, after they had subdued the whole land except the "isle of the nobles," into which the king had retreated with a few nobles. But the relief was only temporary: they returned, under his successors, in greater force, obtained possession of the northern and eastern part of the country, and in the beginning of the 11th century three Scandinavian princes (Canute, Harold, and Hardicanute) ruled over all England for the space of about 25 years. The Saxon line was then restored; but in 1066 William, duke of Normandy, obtained the English throne. This conquest, as it is commonly called, had a most important influence on the Saxon manners, language, and constitution, which had hitherto escaped with little change, and is therefore one of the most important epochs in English history. In the year 1000, according to the Saga narratives, Leif, son of Eric the Red, leaving Greenland, which had been discovered and settled by his father, a Norwegian, proceeded southward in a ship, accompanied by 35 men, and discovered the American coast, to which he gave the name of Vinland. In 1007 a rich Greenlander, with a following of 60, emigrated to Vinland, and there planted a colony, which seems to have thriven, but after a time we hear nothing more about it. The Normans also established a new kingdom in Naples in 1016. The foreign expeditions of the Northmen gradually diminished their numbers and strength at home, and rendered them less formidable.

Consult: Depping, 'Histoire des Expéditions maritimes des Normands et de leurs Etablissements en France au Xme Siècle' (1826); Du Chailu, 'The Viking Age' (1890); Freeman, 'History of the Norman Conquest of England' (1877); Keary, 'Vikings in Western Christendom' (1891).

Norns, nórnx, in Scandinavian mythology, the three Fates, representing the past, the present, and the future, whose decrees were irrevocable. They were represented as three young women, named respectively Urd, Verdandi, and Skuld. They sit by the well of Urd, under the world-tree Ygdrasil in Asgard, and there determine the fate of both gods and men. Besides these three there are many inferior norns, both good and bad, answering to the genii of classical mythology, to such are attributable the unequal destinies of men in the world. Women who possessed the power of prediction or magic also bore this name.

Norridgewock Indians, an American tribe of the Algonquin family. They formerly lived along the Kennebec River in Maine, and were frequently called Kennebec Indians. They were patrons of the French missionaries and were regarded as dangerous enemies of the English colonists. The latter sent an expedition against the Norridgewocks in 1724, and the tribe was practically annihilated.

Norria, nór'is, Edwin, English linguist: b. Taunton, Somerset, England, 24 Oct. 1795; d. Brompton, England, 10 Dec. 1872. His early youth was spent in tutoring, and in 1818-37 he was a clerk with the East India Company. In 1837 he became assistant secretary of the Royal Asiatic Society and in 1859 its secretary. His time was principally devoted to the study of the Semitic languages and the Celtic dialect, and he was an authority on cuneiform writing. His greatest work is his 'Assyrian Dictionary' (1868-72).

Norria, Frank, American novelist and journalist: b. Chicago 1870; d. San Francisco 25 Oct. 1902. He studied at the University of California and at Harvard, after three years as an art student in Paris; was war correspondent of the *San Francisco Chronicle* in South Africa in 1895-6; edited the *San Francisco 'Wave'* 1896-7, wrote articles from Cuba for 'McClure's' in 1898; and was the author of several virile realistic novels: 'McTeague' (1899), 'Moran of the Lady Letty,' a romantic story (1900); 'The Octopus,' a story of wheat raising and transportation (1901), and 'The Pit,' dealing with wheat exchange and gambling. The two last named stories are epical and Zolaesque in manner, and were to have been concluded by 'The Wolf,' a story of European famine.

Norria, Henry, English courtier: d. London, England, 17 May 1536. He became a member of the court in early youth and was a favorite of Henry VIII., holding under him many important offices. He was instrumental in accomplishing the downfall of Wolsey and was a friend of Anne Boleyn while she was gaining her foothold at court. Later he was suspected by the king of an undue intimacy with Anne and though doubtless innocent was imprisoned in the Tower and executed.

Norria, Mary Harriott, American novelist: b. Boonton, N. J., 16 March 1848. She was graduated from Vassar College in 1870, was principal of a private school in New York 1880-96, and dean of the woman's department of Northwestern University, Evanston, Ill., 1898-9. Among her published books are: 'A Damsel of the 18th Century' (1889); 'The Gray House of

the *Qumries*' (1898); 'The Grapes of Wrath' (1901).

Norris, William Edward, English novelist: b. London, England, 18 Nov. 1847. He was the son of a former chief justice of Ceylon; was educated at Eton, and admitted to the bar in 1874, but never practised. His first novel, 'Heaps of Money,' appeared in 1877, and was successful. It was succeeded by 'Mademoiselle de Mersac' (1879); 'Matrimony' (1881); 'No New Thing' (1882); 'His Grace' (1892); 'A Deplorable Affair' (1893); 'A Victim of Good Luck' (1895); 'Billy Bellow' (1896); 'Clarissa Furiosa' (1898); 'Marietta's Marriage' (1899); 'The Widower' (1900); 'Giles Ingilby' (1901); 'An Octave' (1902); 'Lord Leonard the Luckless' (1903); 'Barham of Bel-tana,' 'An Embarrassing Orphan' (1904); all of which have enjoyed popularity. He has shown not a little skill in character drawing and his dialogue is entertaining and natural.

Norristown, Pa., borough, county-seat of Montgomery County; on the Schuylkill River, the Schuylkill Canal, and on the Philadelphia & R. and the Pennsylvania R.R.'s; about 15 miles northwest of Philadelphia. It was settled about 1688 by a colony from Wales, laid out in 1785, and incorporated as a borough in 1812. It was named in honor of Isaac Norris, who owned a large tract of land in what is now Montgomery County. It is in an agricultural and mining section of the State, and has extensive manufacturing interests. The chief manufactures are knitting machines, hosiery, men's underwear, glass, iron, wire, screws, machine-shop products, agricultural implements, iron and wood furniture. It has considerable trade in manufactured articles and farm products. Some of the prominent buildings are the county court-house, city buildings, Masonic Temple, and the county prison. It has a State Hospital for the Insane, Charity Hospital, Saint Joseph's Protectory (R.C.) for girls, Friend's Home, and the Agnes Stinson Home for Aged Ladies. The educational institutions are a high school, public and parish schools, the Montgomery Historical Society, and the McCann library. The tomb of Winfield Scott Hancock (q.v.) is here in Montgomery Cemetery, also a memorial shaft to John F. Hart-ranft. Valley Forge (q.v.) is only six miles west by north, and many other places of historic and scenic interest are in the vicinity. The government is vested in a burgess, who holds office three years, and a council. The assessed value of the city's real and personal property in 1910 was \$12,130,995. Pop. (1910) 27,875.

Norrköping, nór'ké-pfng, Sweden, seaport, on the southeast coast, on the Bravik River; about 80 miles southwest of Stockholm. It was founded in 1384, but it has several times been destroyed by fire. The Motala, a rapid river, flows through the city and furnishes extensive water-power which is used for manufacturing. In 1902 there were over 180 manufacturing establishments, whose annual products were valued at over \$10,000,000. It is an important commercial city, and has an extensive trade in its manufactures of cotton and woolen goods, carpets, paper, etc., and in the imports which are re-shipped at Norrköping for the interior. Pop. about 47,000.

Norrländ, nór'länd, Sweden, the largest of the three historical divisions of Sweden; in the northern part, area, 80,785 square miles. It has a cold climate, well-wooded in the south, scanty vegetation in the north. The towns and villages are chiefly in the southern part; but few settlements are in the northern part. Pop. about 860,000. See SWEDEN.

Norse, the language of Scandinavia, especially in its earlier forms. Old Norse is represented by the classical Icelandic, and still with wonderful purity by modern Icelandic. See ICELAND; SCANDINAVIA.

Norse Mythology. See MYTHOLOGY.

Norseman, or Northmen. See NORMANS.

North, Christopher, the pseudonym of one of the authors of the 'Noctes Ambrosianae.' See WILSON, JOHN.

North, Sir Dudley, English financier and economist, 3d son of the 4th Lord North: b. Westminster 16 May 1641; d. Covent Garden 31 Dec. 1691. He early entered the employ of a merchant in Turkey; became treasurer of Turkey Company; returned to England in 1680; was one of the sheriffs of London in 1682 and a commissioner of customs in 1683; and retired from public life shortly after the accession of William and Mary. He was a man of great ability, one of the first Englishmen to urge the doctrine of free-trade, and the author of an important pamphlet on the 'Currency.'

North, Francis, BARON GUILFORD, English lord chancellor, brother of Dudley and Roger North (qq.v.): b. Kirtling, Cambridgeshire, October 1637; d. Wroxton, Oxfordshire, 5 Sept. 1685. He was educated at Cambridge, and studied law at the Middle Temple. His rise was rapid: in 1671 he was knighted; in 1673 became attorney-general; and from 1675 to 1682 was chief justice of the court of common pleas. In 1682 he became lord chancellor, was created Baron Guilford in 1683, and died soon after assisting at the coronation of James II. His uncompromising royalism made him the object of contemporary attack and present misunderstanding, notably in Lord Campbell's 'Lives of the Lord Chancellors.' It is to an early attack of this nature, namely that in Kennett's 'Complete History' that we owe Roger North's 'Apology' for his brother, which grew into the 'Lives of the Norths.' The conflict of testimony makes his personal character problematical, but it is certain that he was a learned lawyer and a patron of literature, the arts, and the sciences.

North, Frederick, LORD, EARL OF GUILFORD, English statesman, George III.'s prime minister during the American Revolution: b. London 13 April 1732; d. there 3 Aug. 1792. His father was Francis, 1st Earl of Guilford. He was educated at Eton and Oxford; studied and traveled abroad for three years; and in April 1754 was elected to the House of Commons for one of his father's pocket-boroughs. From June 1759 to July 1766 he was a junior lord of the treasury; and in 1767 became chancellor of the exchequer and leader of the House of Commons upon the death of Townshend, whose measures taxing the American colonies Lord North carried through, and in this particular as in general showed himself the 'King's friend' and entirely indifferent to the wishes of the people. Early in 1770 he became

NORTH—NORTH ADAMS

prime minister, but was none the less merely the King's tool; in March 1774 he succeeded in passing the celebrated Boston Port Bill and Massachusetts Bill; and though he seems to have seen soon after the King's policy was a mistaken one and could result only in the loss of the colonies, and although he urged in 1775 that the colonies, if they taxed themselves, should not be taxed by Parliament, he still supported the King's obstinate policy and remained in office, while his government grew steadily weaker because of the defection of men whose scruples, identical with his, carried some force with them. On 20 March 1782 he resigned, just in time to forestall a motion for the dismissal of the cabinet. In February of the next year by a dexterous coalition with his old enemy, Fox, he secured the dismissal of Shelburne, was a member of the coalition cabinet of 1783, and thereafter acted with the opposition against Pitt. The last five years of his life Lord North was blind, but still took some interest in politics, and spoke occasionally in the House of Lords, of which he became a member in 1790 upon his father's death. Personally he was clumsy, awkward, very short-sighted, with an unintelligent puffy face, expressionless eyes, and heavy lips, closely resembling George III. As prime minister he was the King's agent; indeed, he refused to be called prime minister, denying the place of any such office in the British constitution. After his coalition with Fox he broke with the Crown, however, and refused George III.'s urgent offers to make him premier in 1783. He was neither a great statesman nor a great orator, but had a gift of humor, wit, and pleasant temper. Consult: Donne, 'Correspondence of George III. with Lord North' (1867); Lecky, 'History of England' (1882-7); Lewis, 'Administrations of Great Britain' (1864).

North, Roger, English colonist in America; b. about 1585; d. 1652. He was the son of Sir John North, and a grandson of Roger, 2d Baron North, and in 1617 accompanied Sir Walter Raleigh to Guiana, did good service against the Spaniards on the Orinoco, and remained faithful to his commander to the last. In 1619 he applied for a patent to trade along the Amazon, and, when this was denied him because of Gondomar's influence with the King, sailed from Plymouth without leave in May 1620. Hence he was imprisoned upon his return. In 1627 he received letters-patent to found Guiana, but spent the last years of his life in England. North planted the English power in South America and was one of the most notable colonial projectors of his day.

North, Roger, English lawyer and historian, brother of Dudley North and Francis North (qq.v.): b. Tostock 3 Sept. 1653; d. Rougham 1 March 1734. He studied at Jesus College, Cambridge; became a barrister at the Middle Temple; rose rapidly in the practice of law, becoming attorney-general to the Queen in 1682; left political life upon the accession of William and Mary; and spent the rest of his life in retirement. He was a famous book-collector, but is best known for his 'Lives of the Norths,' an invaluable picture of the life of the period, as is his 'Autobiography.' Both these books are included in Bohn's Library (1890). His strong Tory sentiments are to be seen in the 'Examen,'

a critical inquiry into the truth of White Kennett's 'History of England.' North also wrote 'Memoires of Musick' (ed. by Rumbault in 1846).

North, Sir Thomas, English translator of Plutarch, son of the 1st Baron North: b. about 1535; d. about 1601. He studied at Peterhouse, Cambridge; entered Lincoln's Inn 1557; and in 1579 published his version of Plutarch's 'Lives,' actually a version from the French of Amyot. It was dedicated to Queen Elizabeth, was very popular in her day, and was the immediate source of most of Shakespeare's classical plays, notably 'Antony and Cleopatra,' 'Coriolanus,' 'Julius Caesar,' and 'Pericles,' some of which have entire speeches taken scarcely with a change from North. North also translated Guevara's 'Libro aureo,' a Spanish adaptation of the 'Meditations of Marcus Aurelius,' thus rendering Euphuism out of Spanish into English; and a collection of Oriental fables from the Italian of Doni. Consult: Skeat, 'Shakespeare's Plutarch' (1875); and Leo, 'Four Chapters of North's Plutarch' (1878). The complete version is to be found in the 'Temple Classics,' and in a splendid reprint in the 'Tudor Translations' (1895).

North, William, American soldier: b. Fort Frederick, Pemaquid, Maine, 1755; d. New York 3 Jan. 1836. He entered the Revolutionary army in 1775 and served under Arnold in the Quebec expedition. In 1779 he was aide-de-camp to Baron Steuben whom he greatly assisted and who at his death bequeathed to North the bulk of his property. He was present at the surrender of Cornwallis and remained in the army after the war, rising to the rank of brigadier-general in 1798. He sat in the New York State assembly and from 1789-99 was a United States Senator. He was mustered out of service in 1800. He wrote a biography of Baron Steuben.

North Adams, Mass., city in Berkshire County; on the Hoosac River and on the Boston & M. and the Boston A. R.R.'s; about 50 miles northwest of Springfield. It was settled in 1765 and was part of Adams until 1878 when it was incorporated as a town, and in 1895 was chartered as a city. It includes the villages of Brayton, Greylock, Beaver, and Blackington.

It is situated in a beautiful section, amid the Berkshire Hills, at the base of Greylock, the highest peak in the State. In the western part of the city may be seen the site of old Fort Massachusetts, captured in 1746 by French and Indians under command of Vaudreuil. Hudson Brook and its natural bridge are points of interest, and near is the famous Hoosac Tunnel. The chief industrial establishments are machine-shops, cotton and woolen mills, boot and shoe factories, print goods factories, creameries, and cigar factories. The trade is chiefly in manufactures, farm and dairy products. It has a city hospital, good municipal buildings, and a number of fine church edifices. The educational institutions are a State Normal School, high schools, public and parish schools, and the North Adams Library. The charter of 1895 provides for a mayor, who holds office one year, and a council. The school committee, assessors, and library trustees are elected by popular vote. The city owns and operates the waterworks. Pop. (1900) 24,200; (1910) 22,019. Consult: Spear, 'History of North Adams': 'Berkshire Hills.'

NORTH AMERICA

North America. During 1906 the earliest authentic accounts of Amundsen's voyage (1903-5) through the Northwest Passage were received, and this continent on its northern side was for the first time unmistakably defined; for, while it is true that previous exploration had shown approximately the path a ship might follow, no vessel except Amundsen's *Gjoa* has actually passed between the three oceans and the North American mainland. The track of the *Gjoa*, therefore, marks a continental boundary—a channel of open water along the mainland in the latitude of the magnetic pole and about as far from the geographic north pole as are the northern coasts of Siberia and of Norway. The channel is open probably every year for a short time during summer; but still further northward—or, let us say, between the magnetic and geographic north poles—lies the Arctic or Polar Archipelago, permanently ice-bound.

The eastern or Atlantic and western or Pacific limits of this continent are described in other articles written for the *Encyclopedia Americana*. At present we would, in passing, mention only the proximity of the numerous Atlantic ports to Europe, and of the relatively few Pacific ports to the great Asiatic countries: facts which are sometimes regarded as the main features of North America's fortunate situation. A still more favorable circumstance, or, strictly speaking, a more exceptionally favoring circumstance, will become apparent if we study somewhat attentively the southern boundary. The fact that world trade-routes cross North America is an advantage shared with some other lands; the geographic dependence of the tropical continents of the New World is, on the other hand, an unmatched fact.

We shall see that exploitation of tropical America by North Americans, and, ultimately, governmental unification of the Americas, are the results to be expected in view of the ease of communication by the inland waterways of North and South America and the comparative isolation, or remoteness from world trade-routes, of the latter.

Southern Boundary, Transportation, and Communication.—It has been shown in the articles dealing with Central America and the West Indian Islands that from the point of view of a geologist North America does not extend below Florida and Yucatan. Very commonly even Mexico, simply because it is a Latin-American country, is considered to lie outside of the limits of North America, and we hear the phrase "North America and Mexico." On the other hand, in a scholarly German work, entitled 'Die Bevölkerung der Erde' (issued as Supplement No. 146 to 'Petermann's Mittheilungen,' Gotha, 31 March 1904), the author, Alexander Supan, states that the area of North America is 20,817,700 square kilometers and the number of inhabitants 105,714,000, or five inhabitants to one square kilometer; and Dr. Supan's elaborate calculations are based on the assumption that North America includes the West Indies, Mexico, Central America and Panama, as well as the United States and Canada, but not Greenland. The lack of a

settled usage which appears in the foregoing examples is not hard to explain. The Gulf of Mexico and the Caribbean Sea (together forming the American Mediterranean) by which the continents appear, when one first looks at the map, to be divided and held apart, in reality hold the continents together. The American Mediterranean is part of that system of inland waterways the natural result of which has been already referred to. It will not bound: it will bind.

The present writer has on many occasions defended the view that the initiative in the movement to form closer relations between the southern and northern continents would be taken by the former. It is proper, therefore, if the position he has always maintained is at all correct, to take the Latin-American point of view (or at least for a moment to try to understand the sentiment in countries which have failed to govern themselves well) when considering this undeveloped system of waterways. In 1904 some of the leading men of the South American countries advocated the construction of a canal, described by the Bolivian minister to the United States as "Connecting the head of navigation in the southern tributaries of the Amazon with the head of navigation in the tributaries of the Rio de la Plata, thus making all-water inland communication through the heart of the continent from Venezuela on the north to Buenos Ayres on the south." Even now, before any such canal has been constructed, an electric launch, carrying a small party of explorers up the Paraná river from Buenos Ayres to Corrientes, can proceed due north from the latter Argentine town through the geographical center of South America to Manáos, on the Amazon; thence via the Negro, Cassiquiare, and Orinoco rivers to the Venezuelan coast; over the American Mediterranean to New Orleans, and so up the Mississippi and Missouri to the head of navigation, or through the Great Lakes and the St. Lawrence river to the North Atlantic; the explorers bringing to the people of the Mississippi valley specimens of the products of the little known lands in the interior of the southern continent—bringing stories of adventure, stirring accounts of experience and observation there; bringing real information for the first time home to nearly every one.

The boat, it is true, must be constructed in such a manner that it may be carried around obstructions to navigation, since a portage between the Amazon and La Plata river systems and certain rapids in the Orinoco must be anticipated. And, because there is not at present a good, unbroken inland through route for larger vessels between the Caribbean Sea and estuary of the River Plate, the achievement thus suggested may appear at first sight to be of great scientific interest rather than of great practical value.

But the Orinoco link in the chain of waterways between Canada or our Northwest and the remote Southeast of South America has a value which it would be sheer folly to overlook. Let us see what consequences flow from the fact that this long

NORTH AMERICA

voyage by riverways can be made in a specially designed boat, even under existing conditions.

The systems of rivers to which the mouths of the Orinoco give access—to which the Orinoco is our gateway and near approach—are equal to four or five Mississippi. When Columbus sailed past the mouths of the Orinoco he reasoned that such a torrent proved the existence of a land mass of continental dimensions. Humboldt, more than three hundred years afterward, found that the Orinoco was joined to an affluent of the Amazon. The people of North America, preoccupied with great enterprises elsewhere, let another century go by without taking the trouble to realize that the propinquity of the Orinoco, and no other circumstance whatever, would enable them to make good their claim of predominance in every part of the Western Hemisphere; that unless their footing in Venezuela should be assured, and peaceful conditions established so that, by way of the Orinoco, a practicable north-and-south route for ordinary river steamboats could be made through the heart of the continent, the entire eastern and central regions of South America would inevitably become commercial and political dependencies of Europe.

North Americans did not know or care to know that so long as the Orinoco should remain subject to the caprice of Venezuela, and therefore an unimproved route, it would be impossible to prevent the acquisition by military Powers from across the seas of a control in all the region beyond (practically the entire continent except the coast strips west of the Andes and north of the equator), which would in effect be equal to territorial aggrandizement on an enormous scale—in other words, impossible to enforce the Monroe Doctrine as laid down by President Roosevelt in his speech at Chicago, April 2, 1903.

Perforce we restate, though very briefly, one phase of the South American problem, now that we wish to appreciate the theoretical value of the inland route between Argentina and the Gulf of St. Lawrence.

The sailing distance from Pernambuco, Brazil, to some of the coast cities of Western Europe is less than to New York. Besides, the superior facilities for transportation between Europe and the eastern and southeastern coasts of South America are steadily increasing the advantage of the Europeans. Southeastern America, for all purposes of social intercourse, including nearly every kind of intimate association which, with the lapse of time, inevitably binds nations together, can be reached much more easily from Europe than from the great centres of population in North America, if the competition is limited to vessels navigating the Atlantic Ocean. Moreover, such inducements are offered to colonists from Europe that Argentina, for example, in 1901, was re-enforced by three times as many immigrants in proportion to the total number of inhabitants as the United States. A large part of the southeastern coast receives from Europe ideas, manners, fashions, culture, immigrants. That these conditions will not be revolutionized by the completion of the

Panama Canal is shown in the article SOUTH AMERICA.

Now, within the coast region most subject to European influences are the mouths of four great rivers, natural avenues of internal transportation and communication piercing the continent. Only the fifth and last great river, which can be called an avenue in the same sense, the Orinoco, is comparatively near to North American ports. But the advantage for us in this case is enormous. From New York or New Orleans to the mouths of the Orinoco the sailing distance is only one-half as great as the distance between western European ports and the nearest South American rivers or important harbors.

In the vast central regions precocious streams, endowed almost from the start with the volume that elsewhere characterizes full grown rivers, run side by side, in opposite directions, approaching each other so nearly that they furnish a choice of almost continuous waterways between the far south and the north coast. As all know, the rainfall is one of the trustworthy things in the central part of South America. Wherever canalization is required, engineers will find that there is available for the purpose an inexhaustible supply of water which can be directed into the best natural channels, for the development of that mode of transportation in respect to which South America above the Tropic of Capricorn can be made to excel all other inland regions, whether of the Western Hemisphere or the Eastern. This applies equally to the upper Paraguay and Paraná, and to the country north of the Amazon, where important works are required at several points. (See SOUTH AMERICA.)

There is no reason to doubt that, on the completion of the labors of the engineers, river steamers of large size could follow the course of the launch above described, besides penetrating nearly all other parts of the continent.

The Argentina-Venezuela and Louisiana-St. Lawrence route in theory changes the position of North America in relation to the southeastern continent, removing the disadvantage and inferiority to which we have referred.

For the South Americans the existence of this incomparable system of inland water routes is a fact of vital importance. In it is to be found the only compensation for the remarkable absence of good harbors on the South American coasts—for there are very few points on either of those coasts, below Panama and Georgetown, that could ever be made attractive to foreign commerce, even if they were not situated at so great a distance from the world trade-routes. The conclusion seems to be quite clear: The southern boundary of North America must be drawn below the Caribbean, because there is otherwise no reasonable prospect of developing the equatorial regions. (For railways, canals, telegraph, etc., see articles MEXICO, AMERICA, UNITED STATES OF, and the series of articles under CANADA.)

Commerce.—See article AMERICAN COMMERCE.

Political Divisions, Geology, Climate, Rain-

fall, *Natural Sections, Flora, and Fauna*.—See article AMERICA.

History.—See AMERICA, DISCOVERY AND COLONIZATION OF; also articles under general heading UNITED STATES (Department of History of the United States).

Ethnology.—The most important fact to be considered under this sub-title is that European race elements have blended to such an extent that it is impossible at the present time to state accurately the proportions of the white races in the population of the continent. Figures purporting to give this information should be rejected as fallacious. To illustrate this fact, let us select the German element in the United States, which has been studied rather more thoroughly, perhaps, than any other during the last few years.

In 1904 the quarterly publication of the German-American Historical Society of Illinois, entitled *Deutsch-Amerikanische Geschichtsblätter*, contained an article by Mr Ernest Bruncken in which the assertion was made that "the German element of the population of the United States at the present time produces only about one-third as many prominent men as it ought to, in view of its numbers;" and the author of the article, writing in German and addressing people who read that language more easily than any other, referred to his conclusion as though it were a thing not to be doubted—"a somewhat shameful or humiliating fact." We shall consider this "fact" briefly in connection with a recent book, also written in German by an American citizen, *The German Spirit in the United States of America*, by Dr. Julius Goebel, professor of German philology and literature at Stanford University. With an enthusiasm that makes his book exceedingly readable, Professor Goebel calls upon all German-Americans to be united as *Germans*. In the preface he says that the greater part of the real work of colonization in North America was done by Germans, explaining this statement and supporting it by an extensive historical survey which shows "that the opening of the vast western part of America was begun by the Germans of Pennsylvania and continued and completed by the masses of German immigrants eagerly following in their footsteps. True, the people of other nations—English, French, and especially Irish and Scotch—also participated in this pioneer work," but the lion's share in the quiet colonizing which laid the foundations of America's wealth is ascribed to Germans. His contention is, that a race which in the childhood of America rendered the service he measures, or so earnestly tries to measure, should make its influence felt proportionately in the nation now arrived at man's estate. He thinks that the Germans should act as a mighty unit in the endeavor to preserve in the new nation the German conception of life, and above all the mother tongue.

A reply to such typical assertions or appeals, if it is to be quietly convincing, and not merely rhetorical, must be sought in a study of the records of the settlements and of the subsequent growth of population in the various parts of the country. The records will aid us to form a clear idea in

regard to the limitations of our knowledge of the ancestry of German-Americans and of those from whom the writers mentioned above seek to distinguish German-Americans. Fortunately a scholarly presentation of the results of such studies lies before us, in the form of a series of articles contributed to the *Deutsch-Amerikanische Geschichtsblätter* during 1903 by Mr. Emil Mannhardt; and we adopt Mr. Mannhardt's conclusions because that homœopathic course seems uncommonly appropriate.

Mr. Mannhardt says that in the year 1790 German blood ran in the veins of about one-fifth of the population of the United States. In 1830 the Anglo-Saxon-Puritan element numbered 2,964,717; the German element, 2,695,167; and the American population in which the several European strains had already become so thoroughly blended as to be no longer easily distinguishable, 4,852,717. At the century's end he finds in the United States 25,477,583 Germans, as compared with 12,713,036 descendants of the "American" inhabitants in 1830, and 12,118,640 Anglo-Saxons. The Teutonic element (Germans, Scandinavians, Dutch, and Belgians) is given as 43 per cent of the total white population.

But very little reflection upon the foregoing figures will be required to convince our readers that in the course of a century a large part of the German element must have become by intermarriage thoroughly amalgamated with the descendants of British colonists and the nineteenth-century immigrants from Great Britain. It is a fair presumption that the influence of German blood may be traced in the careers of very many of the prominent Americans whose names give no certain indication of their German origin, or of German blood derived through some ancestress. An analysis of Mr. Mannhardt's figures shows, furthermore, that the appeal to German-Americans to unite as *Germans* is addressed to at least twelve or thirteen millions of people whose ancestors were citizens of the United States before 1830.

A full statement as to immigration after 1821, showing both percentages and the total number of persons reaching the United States from foreign countries, will be found in the article AMERICA, UNITED STATES OF. See also IMMIGRATION TO THE UNITED STATES; discussion of ethnologic subjects in the articles MEXICO; the series in DEPARTMENT CANADIAN HISTORY AND DEVELOPMENT, etc., and INDIANS, AMERICAN. The following list of countries from which currents of immigration have flowed to North America is not quite complete, yet suggestive enough: Ireland, England, Scotland, Germany, Norway, Sweden, Denmark, Italy, Russia, Poland, Canada, Newfoundland, Spain, France, Austria-Hungary, Holland, Belgium. In this connection see articles NEGRO IN AMERICA, NEGRO EDUCATION.

Author 'History of War with Spain,' etc.

NORTH AMERICAN INDIANS—NORTH ANNA

North American Indians. See **INDIANS AMERICAN**, *North American Stock*.

North American Phalanx, the most important colony founded by the Fourierists in the United States. It was organized in 1843, and located in Monmouth County, N. J., about 40 miles south of New York. The organization was on the joint stock principle, and all the members were engaged in the co-operative labor of the colony; they were paid a certain amount for labor, for talent (or administration) and for capital invested; the rule was to pay the highest prices for the hardest and most disagreeable labor. The labor was at first mostly agricultural, products being sold outside the colony; but later mills were built and a considerable amount of manufacturing done. A common school education was provided. The life was simple and pleasant, there was a library and reading room, but the colony lacked many of the elements of culture that distinguished the life of Brook Farm (q.v.). The management was good, and for many years the colony prospered; in 1853 dissensions resulted in a secession of some of the members, and the founding of a new phalanx; in 1854 the mills were burned down, a serious loss that badly crippled the colony; and in 1856 the organization was formally dissolved. Consult Noyes, 'History of American Socialisms.'

North Andover, Mass., town in Essex County; on the Boston & M. railroad; about 30 miles north of Boston. It was a part of Andover until 1855 when it was incorporated as a town. It is a manufacturing place, but a large portion is reserved for residential purposes, and it is noted for its beauty and healthfulness. The chief manufactures are woolen goods, mill machinery, and wood products. The government is administered by town meeting. The waterworks are owned and operated by the town. Pop. (1890) 3,742; (1900) 4,243; (1910) 5,529.

North Anna, Operations on the. After the loss of 18,000 men in assaulting Gen. Lee's lines at Spottsylvania Court House, Gen. Grant concluded to turn Lee's position by a movement that would bring him nearer to Richmond, and possibly interpose his army between Lee and that place. The movement was begun on the night of 20 May 1864 by Hancock's Second corps, which, preceded by Torbert's cavalry, marched for the Mattaponi and North Anna rivers. Torbert attacked and drove Kemper's brigade from an entrenched position at Milford Station and across the Mattaponi, Hancock following and intrenching beyond the river on the 21st. Other corps followed Hancock, and Grant's advance reached the North Anna in the forenoon of the 23d at Island and Jericho fords and Chesterfield bridge, the latter a mile above where the Richmond and Fredericksburg Railroad crosses the river. But Lee was in his front. He had detected the movement and put his army in motion for Hanover Court House, and on the morning of the 23d was south of the North Anna, in position covering the roads and railroads leading to Richmond. Here he was joined by Gen. Breckinridge from the Shenandoah Valley, and by Pickett's division from near Richmond. Ewell's corps was on the right, Anderson's in the centre, and A. P. Hill's on the left. Breckinridge and Pickett were in reserve. Gen. Warren, with the Union Fifth

corps, crossed the river at Jericho Ford, constructed a pontoon-bridge, and at 4:30 p.m. of the 23d his entire corps was in line of battle about half a mile from the river and on the edge of a wood next to it, the front being covered by the wood. Cutler's division was on the right, Griffin's in the centre, and Crawford's on the left, its flank resting on the North Anna. About 6 p.m. Wilcox's division of A. P. Hill's corps fell upon Cutler's division and part of Griffin's, driving back Cutler in some disorder, following him, and uncovering Griffin's right; but Griffin drew back his right, Bartlett's brigade hastened to his support, and Wilcox was driven back with a severe loss in killed and wounded, and nearly 1,000 prisoners. Warren lost about 350 men. About the same time Hancock had prepared to force a passage at Chesterfield bridge. A part of Kershaw's division held a bridge-head north of the stream; that was charged and carried about 6 p.m. by the brigades of Cols. Pierce and Egan, with the loss of 150 men, the Confederates retreating across the river. The crossing of the river by Warren, and Wilcox's unsuccessful effort against him, forced Gen. Lee to change and shorten his line during the night of the 23d, until it was nearly in the form of a right-angled triangle, with the right angle opposite Ox Ford and extending down the river three fourths of a mile, then southeast to near Hanover Junction. The left, under A. P. Hill, ran from Ox Ford southwest across the Virginia Central Railroad to Little River. On the morning of the 24th Hancock crossed the river unopposed, and began to intrench within 700 yards of Lee's line, where about 6 p.m. Smyth's brigade was attacked and became sharply engaged. Barlow's division was got ready to attack, but Lee's intrenchments were found so strong that the attack was abandoned. At the same time Wright's Sixth corps crossed the river at Jericho Ford and joined Warren. Burnside's Ninth corps arrived at Ox Ford but could not cross in the front of the blunt angle of Lee's line holding the south side, upon which Potter's division was sent to the left and crossing lower down, formed on Hancock's right, while Crittenden's division moved up stream to near Quarles' Mill, and crossing joined Crawford's division of Warren's corps. Crittenden, supported by Crawford, moved forward to connect with and open the way for Wilcox's division to cross, but was attacked by Mahone's division and driven back with severe loss. Everywhere Lee was found well intrenched. Grant found himself in a false position; his two wings on one side of a stream, difficult at all times to cross, and liable to sudden rise by heavy rains, while his centre was on the other side, with Lee's centre like a blunt wedge, standing ready to receive him, and interposing between his wings, neither of which could support the other. The trains were ordered to recross the river on the 25th, and on the night of the 26th Grant recrossed and, marching to the left 32 miles, crossed the Pamunkey at and near Hanover Town by the afternoon of the 28th, and was in connection with his new base at White House. Consult: 'Official Records,' Vol. XXXVI.; Humphreys, 'The Virginia Campaign of 1864-65'; Walker, 'History of the Second Army Corps'; Grant, 'Personal Memoirs,' Vol. II.; Pennypacker, 'Life of

NORTH ATTLEBORO—NORTH CAROLINA

Gen. Meade'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

North Attleboro, át'l-bûr-ô, Mass., town in Bristol County; on the New York, N. H. & H. railroad; about 30 miles southwest of Boston. It includes the villages of Oldtown, Adamsdale, Falls Village, and Robinsonville. It was settled in 1637 and incorporated in 1887. The chief industries of the town are connected with the manufacturing and sale of jewelry. It has establishments for the manufacture of boxes, buttons, braid, cotton yarn, rope, silverware, machinery and supplies for the jewelry business. Some of the prominent buildings are the G. A. R. Memorial Hall, the Holmes Memorial building, the high school, and the Richards Memorial Library. The government is administered by town meetings. The town owns and operates the electric-light plant and the waterworks. Pop. (1890) 6,727; (1900) 7,253; (1910) 9,562.

North Bay, Canada, town in Nipissing district, in the Province of Ontario; on the north shore of Lake Nipissing, and on the Grand Trunk and the Canadian P. R.R.'s. A United States consul is stationed here. It is a favorite resort for sportsmen on account of the abundance of fish and small game.

North Berwick, bër'ík, Scotland, a fashionable watering-place, formerly a fishing village of Haddingtonshire, at the entrance to the Firth of Forth, 23 miles northeast of Edinburgh. Behind it rises conical North Berwick Law (612 feet). Tantallon Castle three miles east fronting the Bass Rock is a magnificent ruin, finely described in Scott's 'Marmion.' Pop. about 3,000.

North Borneo. See BORNEO.

North Brabant, brâ-bânt' or brâ'bant, Netherlands, a frontier province bordering on Belgium. See BRABANT; NETHERLANDS.

North Braddock, Pa., borough in Allegheny County; on the Pennsylvania railroad; about six miles east of Pittsburg and two miles east of Homestead. It was a part of Braddock until 1897. It has extensive steel rail interests, but a portion of the borough is a residential reserve. The government is vested in a burgess, who holds office three years, and a council. Pop. (1910) 11,824.

North Cape. See CAPE NORTH.

North Carolina, kâr-ô-lî'na, one of the original 13 colonies, midway between Maine and Florida; bounded by Virginia on the north, by Tennessee on the west, by South Carolina and Georgia on the south and southwest and the Atlantic Ocean on the east. It extends from lat. 35° 51½' to 36° 33' N., and lon. 75° 27' to 84° 20½' W. from Greenwich, taking the greatest width each way. Tennessee originally was part of North Carolina, but in 1790 was ceded by it to the United States.

Area.—North Carolina ranks the 19th State in size in the Union, and is the largest on the Atlantic coast save Georgia and Florida. It contains 52,286 square miles (including the area 3,620 square miles of its sounds and rivers) and is slightly larger than England. Its surface is very nearly a one thousandth part of the land area of the globe. Its greatest length from east

to west, from "Cherokee to Currituck" is more than 500 miles and its greatest width north and south is 188 miles.

Topography.—The State is divided by nature into three divisions—Eastern, which is generally level, with many swamps and sandy, farther back with two great sounds near the ocean, the Albemarle and Pamlico; the Central or hilly regions; and the Western which is mountainous. The coast line of more than 300 miles runs at first east of south, thence southwest. Along the whole ocean coast stretches a chain of narrow, barren sand banks, broken occasionally by inlets which are constantly changing, occasionally filling up entirely in the course of years and new ones being opened by storms. The Eastern Division extends inland from the ocean about 150 miles. The dividing line between it and the Central Division trends southwestwardly and was once the shore line of the ocean, all east of it having been in prehistoric ages the bed of the sea. This line is clearly marked by the falls of the rivers. This Eastern Division contains the two great sounds already named into which the Chowan, the Roanoke, the Tar, the Neuse, and other rivers pour their waters. Farther south, the Cape Fear and its tributaries empty directly into the Atlantic. The Central Division, beginning at an elevation above sea-level of about 200 feet, extends an average width of 200 miles westwardly, rising gradually to an average elevation of 1,200 feet or more at the foot of the Blue Ridge. The western part of this Central region is called the "Piedmont section." The Western Division contains 6,000 square miles and has an average elevation of 2,500 feet. The highest peaks east of the Rocky Mountains are to be found here. The highest of them, Mount Mitchell, is 6,688 feet. There are no less than 24 peaks which are higher than Mount Washington in New Hampshire. The principal mountain ranges are the Blue Ridge and Great Smoky Range, but there are also, the Black Mountains and the Balsam. The general trend is from northeast to southwest.

Rivers.—The rivers of North Carolina are numerous, but they are navigable only to the falls, the old shore line of the ocean in the east, hence the grand total of near 3,500 miles (of which scarcely more than 400 miles is navigable) indicates a vast water power which marks out the future of this State as one of the greatest manufacturing States in the Union. Indeed it may be well doubted if there is another which equals it in water power. At the "narrows of the Yadkin" the river has a fall of 50 feet in a distance of two miles.

Sounds and Lakes.—Besides the two great sounds, Albemarle and Pamlico, there are smaller ones, Currituck, Croatan, Roanoke, Core and Bogue. There are many lakes, the largest being Alligator, Phelps, Mattamuskeet, Pungo and Waccamaw. The largest (Mattamuskeet) has an area of 100 square miles, and Lake Phelps is about half as large.

Capes and Bays.—From the shore line jut out Cape Hatteras and Cape Lookout, between which is Raleigh Bay. Lower is Cape Fear, between which and Cape Lookout lies Onslow Bay. South of Cape Fear is Long Bay. The ocean front of North Carolina is considered the most dangerous on the Atlantic seaboard.

NORTH CAROLINA

Islands.—Roanoke Island between Albemarle and Pamlico sounds is the largest in the State and has an area of about 25 square miles. This island was the scene of the first English settlement on this continent, in July 1585. Here also was born the first child of the English race on this continent, Virginia Dare, 18 Aug. 1587. This colony made under the auspices of Sir Walter Raleigh (in whose honor the capital of the State is named) was soon abandoned. Cedar Island is nearly as large. Smith's Island at the mouth of the Cape Fear has nearly 15 square miles.

Climate and Rainfall.—The mean temperature is 59 degrees or about the average temperature of the Northern hemisphere. The State is on the same isothermal line as middle California, southern France and northern Italy. The rainfall is 60 inches for the eastern belt, 45 inches for the central and 58 inches for the western.

Geology.—The Eastern Division is covered with a stratum 50 to 300 feet thick of Tertiary sands and clays. It shows numerous marl deposits and phosphate beds. Through the Central part of the State is a three foot seam of triassic, not carboniferous, coal which is estimated to cover 70 square miles. The Western part of the State shows azoic formations only.

Soil.—The soil of the eastern division is generally sandy. Along the rivers are extensive bottom lands of clayey loam, which are very fertile, while the swamp lands have a deep, peaty black soil, and when drained are exceedingly fertile. In the central and western divisions the soil is clay, and gravelly or sandy loam.

Agricultural Products.—North Carolina is the only State that fills every blank in the Census of farm products, yielding all the crops grown in both the northern and southern sections of the Union. Its greatest crops, however, are corn, cotton and tobacco. Cotton is grown in the Eastern Division and in the southern half of the Central Division. The yield in 1912 was 1,106,000 bales, eight times the quantity produced by this State in 1861, being the largest percentage of increase shown by any State since the Civil War, save Texas. In tobacco production North Carolina is second only to Kentucky and the area has been steadily increasing. Nine tenths of the tobacco known in the markets of the world as "Virginia Brights" is grown in North Carolina. Corn is grown in every county. Rice is produced in large quantities in the Eastern Division and in the production of sweet potatoes the State stands first. In the last few years there has sprung up a great trucking industry, which extends from Currituck to Brunswick. Grape culture has largely increased of late years and no small quantity of wine is produced and shipped.

Timber.—The extent and value of the forests are especially noteworthy ranging from the palmetto, magnolia and live oak around Wilmington to the fir, hemlock and white pine in the mountains of the west. The vast quantities of pine and cypress, and of hardwoods specially oak, hickory, ash, walnut and gum have not only attracted saw mills but have created large furniture factories at High Point and at other places. Of the various species of trees found in the States east of the Rocky Mountains all the

eight varieties of pine, the seven varieties of magnolia, the five varieties of maple, and both varieties of walnut are found in North Carolina, while it produces 19 out of the 20 varieties of oak, four out of the five varieties of spruce, three each out of the five varieties of elm and birch respectively and six of the eight varieties of hickory. Immense quantities of turpentine, rosin, tar and pitch are also produced from the vast tracts of pine forests.

Fowls.—Deer, red and gray foxes, raccoons, squirrels, opossums and rabbits are numerous, while wolves, bear, wildcats, beavers and others are still to be found. Swan, geese, brant and wild duck swarm in the sounds, bays, and rivers of the east in the cold months, while in all parts of the State quail, woodcock, snipe, doves and wild pigeons, larks, and many other birds are numerous. The attraction to sportsmen has been so great that a close season for game has been enacted by the legislature, and recently an Audubon Society has been authorized by the legislature for the protection of birds.

Fisheries.—More than 12,000 men are employed in the fisheries on the sounds and at the mouths of the rivers. More than \$1,500,000 capital is invested. The shad and herring fisheries are especially valuable. Many of the seines are from a mile to three miles long and are operated by steam power. There are 26 counties interested in this industry, the principal ones being Currituck, Pasquotank, Chowan, Bertie, Beaufort, Dare, Pamlico, Craven, Carteret, Onslow, New Hanover and Brunswick. Herring are mostly cured in salt and shipped in barrels, but the shad, striped bass, chub, perch, and other fish are shipped on ice, the large fisheries having each its own ice factory. The State in 1876 organized its fish commission, establishing fish hatcheries which largely increased the catch of fish. Of recent years the United States government has taken over this work and has a shad and herring hatchery at Edenton and a similar establishment for rock bass and salmon at Weldon, at the falls of Roanoke River. The young fish thus hatched are set free in all the principal rivers and waters of the State and in other States, some being shipped even to the rivers of the Pacific coast. The oyster and shell fish industry in the eastern waters are also of great value. The State has an Oyster and Shellfish Commission which owns a steamboat and has many agents to encourage and protect this industry. The oysters are of fine quality, those of New River being especially prized. Diamond-back terrapins and turtles are found all along the coast and are shipped north and inland, as are also large quantities of clams.

Navigation.—Vessels drawing 24 feet can ascend the Cape Fear River 30 miles to Wilmington, while the river is navigable 120 miles further to Fayetteville, to which point the Federal government contemplates deepening the channel to 8 feet. Th Roanoke is navigable 130 miles to Weldon, the Tar and the Neuse about 100 miles each and the Chowan for 75 miles. Two canals connect the Albemarle and Pamlico Sounds with Chesapeake Bay, and Congress has before it a bill to establish an inland waterway along the whole front of the State by deepening the sounds which lie behind the sand banks which fringe the seaboard.

Manufactures.—The water power of the

NORTH CAROLINA

State owing to the great non-navigable length of its rivers and streams is very great, in fact more than twice enough to manufacture the entire cotton crop of the South. Already the State has more cotton factories than any other in the South and is a large manufacturer of tobacco. Other factories of all kinds have greatly increased in number. There are over 50,000 persons employed in tobacco manufacturing and over 40,000 in the cotton factories. Child labor under 12 years of age is forbidden by law in factories of all kinds. The chief manufactures of tobacco are to be found at Durham, Winston, Reidsville, and Henderson. There are also cotton factories at those points and at Charlotte, Raleigh, Concord, Salisbury, Fayetteville and at other towns as well as at many points on the streams remote from towns, especially in Alamance and Gaston counties, which counties have the largest number of cotton factories of any in the State.

Minerals.—The State has areas of coal, copper, gold, mica, iron, corundum, kaolin and marl. The last is to be found only in the eastern part of the State, the others in the centre and west. Silver, lead, zinc, zircon, graphite and manganese are also found. The deposits of iron are widely distributed over the State, the most abundant kind being the magnetic. The Cranberry iron mine in Mitchell County yields an ore unsurpassed in the world. There are two bituminous coal fields—one in Chatham and Moore counties and the other in Stokes and Rockingham. Both are in close proximity to extensive deposits of iron. Gold is found in 20 counties, mostly in the centre and west of the State, and more than 40 mines are being worked. Up to the discovery of gold in California, North Carolina was the largest gold producing State in the Union; the total yield up to date has been about \$30,000,000. Tin has been found in Cleveland County. At one time three fourths of all the mica in the world was mined in this State and largely in Mitchell County. It is of a superior quality and plates three and four feet across are not unusual. Beautiful marble underlies large sections of Cherokee and Clay counties in the extreme west. Granite, sandstone, and porphyry are to be met with in large quantities, and superior stone for grist mills is quarried in Moore County. Near Wilmington are valuable phosphate beds. The State produces more corundum than any other locality in the world and of the best quality. The valuable gems, diamonds, emeralds, rubies, garnets, amethysts, opals, agates and hedenites are found. A fine exhibition of minerals, gems, marbles and stones of all kinds is to be seen in the Museum of the State Agricultural Department at Raleigh. At Dunn's Mountain near Salisbury is an exhaustless supply of granite almost as white as marble, and at Mount Airy is an equally large quarry of light gray granite. Near Raleigh is the granite quarry from which the material for the State Capitol was taken. Indeed granite quarries of good quality are to be found in most of the counties and sandstone quarries are numerous. Mineral springs are numerous, the most noted being the Panacea Springs in Halifax County and the Seven Springs in Wayne in the east, while in the centre and west are the Hot Springs in Madison, the Sulphur Springs in Jackson, the Glen

Alpine and Connelly Springs in Burke, the Vade Mecum Springs in Surry, the Lithia Springs in Lincoln, Cleveland Springs in the county of that name, Jackson Springs in Moore, and there are many others. Among natural objects of interest are Mount Mitchell, the highest peak on this continent east of the Rocky Mountains; Linnville and Cullasaja Falls; Hickory Nut Gap and the adjacent Chimney Rock; Table Rock and Paint Rock.

Railroads.—There are now about 4,500 miles of railroad in operation and several hundred miles more under contract or in contemplation. There are street railways in all the larger towns and a few miles of rural trolley lines with many more proposed. The four principal railway systems are the "Southern" the "Seaboard Air Line", "Norfolk Southern" and the "Atlantic Coast Line." The railroads are valued for taxation at \$70,000,000, but this is much less than half their true value, as they were returned in the census of 1890 as then worth \$151,000,000.

Government.—The present constitution, adopted in 1868, amended by a convention in 1875 and by several amendments submitted by legislatures since and ratified by the people, provides for an executive department consisting of a governor (not re-eligible), a lieutenant-governor, secretary of state, treasurer, auditor, superintendent of public instruction, commissioner of agriculture and commissioner of labor, all elected by the people for four years. There is also a commissioner of insurance elected by the legislature, and a corporation commission of three members elected by the people for a term of six years. The legislative department consists of 50 senators and 120 members of the house of representatives elected by the people every two years. The judicial department consists of a supreme court composed of a chief justice and four associates chosen by the people for eight years and 16 superior court judges, who are chosen for the like period by the people and who ride in rotation each of the 16 superior court districts into which the State is divided.

Education.—North Carolina was the second State to establish a State University, which it did in 1789 at Chapel Hill. It has now also the State Agricultural and Mechanical College at Raleigh and a State College for Women at Greensboro. These three constitute a complete system of higher education by the State. There is also a State Agricultural and Mechanical College for the colored at Greensboro. There are also many sectarian colleges, of which the Baptists have one at Wake Forest, the Presbyterians at Davidson, the Methodists at Durham, and there are others. There are also several colleges for women, and three colleges for the colored people. As early as 1825, the State provided a public school fund and in 1840 established a public school system. This now provides instruction in primary and intermediate grades, free of charge, to all children between the ages of 6 and 20. There is an annual appropriation for normal institutes for the instruction of both white and colored teachers. The public school system supported by State appropriations is supplemented by graded schools for free education maintained in all the larger towns by local appropriations. The public funds for education are divided between the

NORTH CAROLINA

whites and blacks per capita. Besides the State Library of 60,000 volumes, and the Law Library of the Supreme Court of 30,000 volumes, both at Raleigh, several towns have public libraries and the University and all the colleges maintain libraries. The State has also established libraries for the public schools in the rural districts.

Penal and Charitable Institutions.—The State has established a penitentiary at Raleigh, three insane asylums—one at Goldsboro for the colored people, the other two for the whites at Raleigh and Morganton. There is an Institute for Deaf Mutes for the whites at Morganton and one for the colored deaf, dumb and blind at Raleigh and an Institute for the Blind for the whites also at Raleigh.

Counties.—There are 100 counties, of which Robeson is the largest and New Hanover the smallest. Wake has the largest population and Graham the smallest. There are railroads in all the counties except seven.

Cities.—The principal towns are Wilmington, the chief seaport, 30 miles above the mouth of the Cape Fear, up to which vessels can come drawing 24 feet; Raleigh, the State capital, named in honor of Sir Walter Raleigh; Charlotte, Greensboro, Salisbury, Statesville, and Winston in the central part of the State; Asheville, Waynesville and Morganton in the west, and Fayetteville, Goldsboro, Washington, Elizabeth City, New Bern and Beaufort in the east, the last four being like Wilmington, seaport towns.

Colonies.—There is a growing stream of immigration from the North, which in some instances has taken the form of colonies, the most successful and prosperous of which is at Southern Pines in Moore County. This State has the smallest per cent of foreign population in the Union, and indeed irrespective of percentage the smallest foreign population of any State.

Population.—By the census of 1910 North Carolina had a population of 2,206,287; of which 1,500,513 were whites; 697,843 were negroes and 2,015 Indians. There were 1,098,471 males and 1,107,816 females. There were something more than two whites to every negro. The bulk of the negro population is in the eastern division and the southern half of the central division. There are very few negroes in the mountain country.

History.—The coast of North America was first seen by John Cabot in 1497, and 87 years later the first attempt by the English to establish a colony on this continent was made by Sir Walter Raleigh, whose exploring expedition of two ships arrived at Wokoken Inlet on the coast of North Carolina 4 July 1584. This expedition landed at Roanoke Island and carried back two savages, Wanchese and Manteo. The next year Raleigh sent out a fleet of seven ships under Sir Richard Grenville which settled 108 colonists on the Island under Gov. Ralph Lane. Falling into straits for want of food, these colonists were taken home in June 1586 by Sir Francis Drake, who was returning with his fleet from a raid upon the Spaniards in the West Indies. Soon after they left, Sir John Grenville arrived with relief, but not finding the colony, left 15 men and returned home. In 1587, a new colony consisting of 89 men, 17 women and 2 children

came out under Gov. John White. His daughter, the wife of Ananias Dare, on 18 Aug. 1587 gave birth at Roanoke Island to Virginia, the first child of English parentage born on this continent. Gov. White soon returned to England, but the Spanish Armada of 1588 prevented aid being sent to the colony till 1590, at which time the colony had disappeared and the fate of the "Lost colony of Roanoke" is one of the unsolved problems of history. The next settlement by the English was made at Jamestown, Va., in 1607. In 1629 a grant of Carolina was made to Sir Robert Heath and an abortive attempt at settlement was made in 1639. Gradually scattering settlers came into the Albemarle and Pamlico region from Virginia, and in 1660 a New England colony bought land from the Indians and settled near the mouth of the Cape Fear. They soon left, but were succeeded in 1663 by a colony from Barbados under Sir John Yeamans, who repurchased the land from the Indians. This settlement was abandoned in 1690. On 24 March 1663 Charles II. granted to the Duke of Albemarle (the restorer of the monarchy) and seven others, as Lord Proprietors, all the country between the Atlantic and Pacific Oceans and between latitudes 36° and 31°, and William Drummond was appointed Governor. In 1665, a second charter to the same Lord Proprietors was granted, extending the limits to lat. 36° 30' on the north. The first legislature was held in 1665. In 1669 the "Fundamental Constitutions of Carolina" drawn up by the famous John Locke were adopted by the Lords Proprietors and were sent out to the colony. They proved too elaborate and cumbersome for the handful of pioneers, residing mostly in the northeast of the province, on Albemarle Sound, and after a nominal existence they were repealed in 1693. Twenty proprietary governors followed in rapid succession. For the most part, save Drummond and Archdale, they were very unfit, and often unworthy men. The sturdy colony deposed six of them and sent them back. One (Sothel) they put into prison and forced him to take an oath of abdication. In 1677 under Gov. Calpeper there was open rebellion on account of undue taxation on tobacco and interference with trade regulations. Again in 1708 under Thomas Carey there was a rebellion on account of the taxation of Quakers and Dissenters for the support of the Established Church. For more than two years there was no government of any kind in force, the farmers attending to their crops and "doing and saying what they list." In 1691 was adopted a system of having one governor for Carolina with a lieutenant-governor each for Albemarle and Charleston, the two principal settlements. In 1708, Bath was incorporated as the first town. In 1710, Gov. Hyde, a cousin of Queen Anne, came out as the first governor of North Carolina. On 20 Sept. 1711 the Tuscarora Indians, by preconcert, fell upon and massacred the settlers on the Roanoke, Neuse and Pamlico. The war lasted two years, but with the aid of troops from South Carolina the power of the Indians was broken with the capture of their fort at Nahucke in the spring of 1713. In 1718, Edward Teach, commonly known as "Blackbeard," the leader of the pirates who had troubled the colony, was killed in a sea fight off Bath, which put an end to piratical depredations. In 1728

NORTH CAROLINA

the long boundary dispute with Virginia was settled, the line being surveyed to the foot of the mountains. In the same year seven of the lord proprietors sold out their interest to the crown for \$87,500. Earl Granville retained his one eighth which was set off to him as a strip of land, 70 miles wide, next to the Virginia boundary, though he surrendered all right to share in the government. At this time there were three counties, Albemarle, Bath and Clarendon, divided into eight precincts. In 1729 the above counties were abolished, the precincts becoming counties, and the colony being definitively divided into North Carolina and South Carolina. The population of North Carolina was then about 40,000. The Royal government thus established continued until the Revolution. There were five Royal governors, George Burrington 1729-34; Gabriel Johnston 1734-1752; Arthur Dobbs 1754-1765; William Tryon 1765-71; Josiah Martin 1771-75. During this period immigration came in rapidly, mostly from Virginia and Pennsylvania, so that at the outbreak of the Revolution the population had risen to 300,000 and there were settlements to the mountains and beyond. There were Scotch settlements made after Culloden on the Cape Fear. Germans and Moravians came in by way of Pennsylvania, from which also and from Charleston came many Scotch-Irish. In 1740 the Province sent a battalion to join the English expedition against Carthage in South America. In 1749 the first printing-press was set up. The first book was printed in 1752 and a crude postal service was established in 1755. In 1758 the colony set a regiment under Col. James Innes to Winchester, Va., to take part in the war against the French and Indians, and soon after sent other troops under Hugh Waddell against the Cherokees in the west of the province. The colony openly resisted the Stamp Act and on 16 Nov. 1765 forced the stamp master, William Houston, to resign his office and to swear not to receive the stamps. In February 1766 under the leadership of Hugh Waddell and John Ashe the inhabitants of Wilmington, without using any disguise, boarded the *Viper*, sloop of war, and demanded and obtained the release of certain merchant vessels which had been seized on account of failure to observe the Stamp Act. A few days later 700 armed militia surrounded the house of Gov. Tryon and took therefrom in his presence the comptroller of the province and forced him to do what Houston had done. In 1765 an agitation began against the exaction of exorbitant official fees, and poll-tax, which culminated in open war, known as the Regulators War, in which the insurgents were crushed by Gov. Tryon at the battle of the Alamance 16 May 1771. This was really the first bloodshed in the Revolution. In August 1774 a Provincial Congress was held in New Bern in defiance of Gov. Martin's prohibition, which elected delegates to the Continental Congress. In Edenton 51 women held the famous "Tea Party," subscribing to a paper to boycott the use of East India tea and to abide by the action of the Provincial Congress. Patriotic meetings were held in many counties. Soon after the receipt of the news of Lexington and Concord, the people of Charlotte assembled, 20 May 1775, and declared the country independent of Great Britain and

by special messenger sent a copy of their proceedings to the Continental Congress. This was the first declaration of the kind in America. In honor of this event, "20 May 1775" is borne on the State seal. Gov. Martin fled from New Bern 14 June 1775 and took refuge on a British man of war. On 12 April 1776 the new State instructed its representatives in the Continental Congress to vote for independence, being the first State to do this. A free Constitution was adopted in that year. The first victory for the patriot cause was that gained by the North Carolina militia at Moore's Creek 27 Feb. 1776. The State furnished ten regiments of "Continental" Regulars and many thousands of militia for shorter "tours of duty." In 1780-1 the State was invaded by Cornwallis. On 7 Oct. 1780 a most damaging blow was inflicted on him by the destruction of Ferguson and his detachment at King's Mountain, the bulk of his assailants being from North Carolina and Tennessee (then a part of North Carolina). On 15 March 1781 was fought the battle of Guilford Court House. The Americans under Greene retired, but the result was a practical defeat for Cornwallis, who fell back to Wilmington, whence he marched to his fate at Yorktown. North Carolina was represented in the Federal Constitutional Convention at Philadelphia in 1787, but it was the last State but one to ratify the Constitution, which it did not do till assured for the adoption of the first ten amendments to that instrument. It rejected the United Constitution in 1788, but ratified it in November 1789. Thus it did not participate in the first election for President. At the first census, 1790, it was the third State in point of population (391,000), coming after Virginia and Pennsylvania only, and ahead of New York and Massachusetts.

One of the first acts of the State as a member of the Union was the cession of Tennessee, which was accepted by the United States 2 April 1790. The permanent capital was located at Raleigh by statute in 1791. There soon set in a tide of emigration to Tennessee, then to other Southern and Western States, so that North Carolina which in 1790 ranked third in population was only eleventh in 1840. This tide showed no slackening until after 1850. In the War of 1812 the State furnished nine regiments, two of which went to Norfolk, and one to Jackson's aid in the Creek war. Capt. Johnson Blakely of Wilmington commanded the United States sloop *Wasp* and destroyed many English ships. Among its many privateersmen who preyed on the enemy's commerce Capt. Otway Burns was the most famous. In the Mexican War the State sent a regiment and two companies.

North Carolina was the next to the last State to enter the Federal Union in 1789 and she was the next to the last to leave it in 1861. The State voted against Secession in February of that year, but when President Lincoln called for troops to coerce the seceding States and Virginia had seceded, North Carolina on 20 May 1861 followed her example. The die was cast, she did her full duty to the cause she had espoused. With a voting population (white) of 112,000 in 1861 she sent over 127,000 men to the Confederate armies. Some 5,000 or more (whites and blacks) joined the Union forces.

NORTH CAROLINA COLLEGE—NORTH CAROLINA, UNIVERSITY OF

The first man killed on the Southern side in battle was a soldier from this State, and historians claim that the dead left nearest the enemies' lines at the pivotal battles of Gettysburg and Chickamauga were North Carolina's sons, and they fired the last volley at Appomattox. The captures of Fort Hatteras, Fort Fisher, of Plymouth, the battle of Bentonville 19-20 March 1865, and the surrender of Joseph E. Johnston 26 April 1865 were the most notable events of the war which took place on her soil. Wilmington was famous as a port for blockade running and was the last to be closed. Her war governor was Zebulon B. Vance, afterward for many terms United States Senator. The State lost 42,000 killed and wounded, or about one third of the troops she furnished to the Confederacy. In 1868 began the era of Reconstruction, when the blacks were first allowed to vote and the "carpet bag" rule began. The Ku-klux Klan (q.v.) was organized as a protest against this in 1869, and the State was in a turmoil until the whites regained full control of the government. In 1870 Gov. Holden was impeached and removed from office. The State has grown rapidly in population and development since the war. In 1894 and 1896 the Populist and Republican parties combined and carried the State. In 1898 the State again became Democratic and the General Assembly submitted a Constitutional Amendment disfranchising the uneducated negroes, which was ratified by the people in 1900. Prohibition was adopted on a referendum vote in 1908.

WALTER CLARK,
Chief Justice Supreme Court of North Carolina.

North Carolina College of Agriculture and Mechanic Arts, a technical industrial institution founded in 1889 at West Raleigh. It was the result of a movement that had been agitated for some years by a small but earnest and determined set of men who became convinced that the industrial growth of the State was being retarded by the lack of technically trained men to assist and guide this development. The college opened its doors to students in October 1889, and, like all new enterprises, at first encountered some hostility, a great deal of indifference and incredulity being exhibited as to its power to do the work that was wanted. When the college opened it had only one building, very little equipment, and only five professors present for duty. Since then, nine other large and comfortable buildings have been added, and the shops, the drawing-rooms, the chemical, the physical, the horticultural, the electrical laboratories, the barn, the dairy, and all the class rooms have been equipped with the best modern apparatus to do thorough and practical work. The specific object of the college is to give young men, besides a general education, a technical training that will make them self-sustaining in life, and intelligent directors of agricultural and mechanical enterprises. A regular college course, minus the classical languages but plus scientific studies in particular lines, is offered at tuition fees so low as to attract young men from all parts of the State. Four years' courses are offered in agriculture, civil, mechanical, electrical, and chemical engineering, textile work, cotton manufacturing, and dyeing; the degrees conferred for the completion of these courses are bachelor of

agriculture and bachelor of engineering; there are also graduate courses, two years' courses in agriculture, mechanic arts, and cotton manufacturing, and twelve weeks' courses in agriculture, carpentry, machine shop work, engine and boiler tending, and machine drawing and designing. The experiment station is also connected with the college, and receives an annual Federal appropriation. The college controls the national land grant of 1862, and also receives State and Federal appropriations, in 1910 the income amounted to \$95,000. The library contained 7,500 volumes; the students numbered 570, and the faculty 48.

North Carolina, University of. The University of North Carolina is situated among the hills of Orange County in the town of Chapel Hill, 500 feet above the sea. The charter of the university was granted in 1789. The cornerstone of its first building, the Old East, was laid on 12 Oct. 1793, now known as University Day. Its endowment by the State was in the form of old claims on sheriffs and other public officers and escheats, including unclaimed land warrants, to be located in West Tennessee, granted to soldiers of the Continental Line. Only a small sum was realized from these sources for many years. The money which enabled the doors to be opened in January 1795, was realized from donations in small amounts by friends of education and a loan of \$10,000 by the State, afterward converted into a gift.

The management was at first entrusted to Rev. David Ker, D.D., afterward federal judge of Mississippi Territory, as presiding professor. The post fell successively to Profs. Charles W. Harris, Joseph Caldwell and James S. Gillaspie, but in 1804 the trustees elected Caldwell, a graduate of Princeton, to the office of president. Dr. Caldwell in 1812 resigned the presidency, in order to devote himself to his department of mathematics. His successor, Rev. Robert Hett Chapman, born in New York, held the presidency four years, when Dr. Caldwell was re-elected. In 1835 the residue of the Tennessee lands was sold and an endowment of about \$200,000 realized. The new president, ex-Governor David Lowrie Swain, was widely and favorably known. The number of students increased and when, in the decade beginning with 1850, the South became prosperous, the number of students reached as high as 461 in 1858-9.

The alacrity with which the students rushed into the Civil War may be gathered from the fact that out of the 243 freshmen in the three years ending in 1861 only 16 became graduates. Two hundred and seventy alumni are known to have lost their lives in the struggle. Although numbers diminished, the energy of President Swain kept the doors open until the end of the War, and until the trustees, elected under the Reconstruction Acts in 1868, dismissed all the faculty and suspended the exercises for six months.

The most prominent professors under the old régime were Archibald D. Murphey, afterwards a judge and a forceful advocate of public schools; Rev. William Bingham, founder of the Bingham School; Ethan A. Andrews, an able writer of text-books; Denison Olmsted, author of works on Natural Philosophy, afterwards professor at Yale; Elisha Mitchell, who gave his name to Mount Mitchell, the highest peak east

NORTH DAKOTA

of the Mississippi, the pioneer of chemistry, geology and mineralogy in the State; James Phillips and Charles Phillips, his son, eminent mathematicians; Walker Anderson, afterwards chief justice of Florida; William M. Green, afterwards bishop of Mississippi; William Hooper, afterwards an eminent preacher and college president; Charles F. Deems, author and pastor of Church of the Strangers, New York; William H. Battle, judge of the supreme court; Albert M. Shipp, afterwards dean of the theological department of Vanderbilt; Nicholas M. Hente, scientific author; A. D. Hepburn, afterwards college president, and other accomplished men.

The endowment of the university was lost during the War. The new president, Solomon Pool, after a year's trial, was forced to close the doors. By a constitutional amendment the general assembly elected a new board of trustees in 1874. These were hindered by legal difficulties, thrown in the way, from taking charge until the next year. The doors were then reopened, alumni and friends repairing the buildings and the general assembly granting a small annuity, coming from the land scrip fund, Rev. Charles Phillips, D.D., being chairman of the faculty. In 1876 Kemp P. Battle, who had been tutor of mathematics in his youth, and afterwards a lawyer and State treasurer, was elected president. Soon an annuity of \$20,000 from the State was secured, and that, with income from endowments and tuition money, enabled the trustees to increase the faculty largely and add to the library and apparatus.

In 1877 the university was the first institution in the South to inaugurate a summer normal school. It was continued with much success, and has been one of the chief agents in arousing the spirit of education in the State.

President Battle resigned his office in 1891, and was succeeded by George T. Winston, professor of Latin, under whose energetic management the numbers rose to 412. He resigned in 1896 to accept the presidency of the University of Texas. Then came Edwin A. Alderman, professor of pedagogics, under whom the institution was still further advancing, when in 1900 he accepted the presidency of Tulane University. The trustees then entrusted the care of the university to the professor of chemistry, Francis P. Venable, under whom the number of students has risen to 622 and the faculty to 66.

Since 1875 the old curriculum of Latin, Greek and mathematics, with a small amount of scientific and other studies, has been abandoned. An equal attention is paid to the sciences, well-equipped laboratories supplied, and courses mapped out leading to the degree of A.B. The departments of the university have been increased until they now embrace a collegiate department leading to the degree of A.B., a graduate department giving the degrees A.M. and Ph.D., a law department having a two-years' course leading to B.L.; a medical department giving two years at Chapel Hill and two years at Raleigh with the degree of M.D., a pharmacy department with a two-years' course leading to Ph.G., and a mining department.

Since its foundation the University of North Carolina has been a chief factor in the development especially of the Southern States. From its walls have gone a national President (Polk), a Vice-President (King), heads of departments

(Branch, Eaton, Graham, Dohbin, Thompson), a solicitor-general (Phillips), a president of the Senate (Mangum), foreign ministers (Miller, Saunders, Barringer, Rencher), and many senators and representatives of the Union, while its alumni have as governors, judges, legislators, preachers, teachers and in corporate and individual private enterprises largely aided in molding our institutions and pushing onward our civilization.

FRANCIS P. VENABLE,
President of the University.

North Dakota, *da-kô'ta*, a northwestern State (No. 26 in the Union), abutting on Canada (Assinibou and Manitoba), and bounded south by South Dakota, east by Minnesota, and west by Montana. It extends 360 miles east and west and 210 north and south. Area, 70,795 square miles, of which 600 is water. Capital, Bismarck. Pop. (1910) 577,056.

The State is part of the great prairie region, extending far into Canada. Its surface is mostly level or gently rolling. The only tract of considerable elevation as a whole is the Turtle Mountain district in the north centre, about 20 by 40 miles in length, a small part in Canada,—a district of low hills, whose highest points are Butte St. Paul, 2,500 feet, and Bear Butte, 2,400 feet. A great number of isolated buttes, with some short ranges of hills, are scattered through the southwestern portion beyond the Missouri. The generally even surface of the State renders it best classified by the valleys and watersheds of its rivers: (1) The Red River of the North, forming its entire eastern boundary, flows into Lake Winnipeg, through a valley of rich bottom land 50 to 60 miles wide, elevated beyond the reach of overflows, and rising in the north to the Pembina highlands. The chief affluents are the Sbeyenne in the south, the Goose in the centre, and the Pembina in the north. (2) The Dakota or James River (French, "Rivière de Jacques"), in the south, is half way between the Red and the Missouri. This is the longest unnavigable river in the world and flows (600 miles) from the central plateau through South Dakota into the Missouri. Its valley is one of the most noted artesian districts on the globe, being underlain by the Dakota sandstone, a great water-bearing stratum which occupies a large part of the State. (3) The Mouse or Sooris River in the north, west of the centre, flowing south by east down from Canada, sweeping around in a great loop and then running north into Canada again, joining the Assiniboine. It is noted for its valuable coal deposits and stock ranges. (4) The Missouri has a navigable course of about 300 miles in the State. Its *coteau* or plateau, a stony upland separating its bed from that of the Dakota, extends in a huge curve through the centre of the State and is dotted with small alkaline lakes. (5) The southwestern triangle beyond is a country of broad semi-arid valleys and scattered buttes. It contains two main watersheds lying at right angles to each other: the Little Missouri, running north and south in the extreme west for 150 miles, then turning east for another hundred to join the Missouri, and those of the Cannon Ball, Heart and Knife, which flow into the Missouri from the west. The Missouri has no considerable affluent from the east within the State. At

NORTH DAKOTA

the extreme west, north of the centre, the Yellowstone runs its last few miles in the State before joining the Missouri. Up and down the centre are hundreds of small lakes. In the northwest are one or two larger ones, but the one great group is northeast of the centre, its chief member being Devil's Lake (Indian, Minnewaukan), a wildly irregular body of salt water some 50 miles long by 1 to 12 wide, about 400 square miles in area, 1,467 feet above the sea, and with no visible outlet. Hurricane Lake and Lake Irwin drain into it. North and east lie the Sweetwater Lakes and Stump Lake.

Geology and Minerals.—The entire surface of the State has been worn by glacial action and having been afterward repeatedly submerged, is covered with the mud of extinct lakes. One of these was the vast Lake Agassiz (q.v.), larger than all the Great Lakes together, of which the Red River Valley forms a part. The southwestern triangle of the State is entirely underlaid with lignite or half-made coal (the soft coal of Germany), which is so abundant that the farmers often dig their own supplies from the hillsides. The fuel is also to be found in quantities sufficient to be of economic importance throughout the entire portion of the State which lies west of the hundredth parallel. Lignite is a free burner, and an excellent gas coal, but has been thought too light for the strong drafts of locomotives. The coal famine of 1902, however, stimulated invention, patterns in stoves have made it available and satisfactory for household purposes, and the process of briquetting promises well to remove most of the objections to it for locomotive uses. Many new mines have been recently opened, and there are now 43 in the State. The cheap power to be derived from this source is expected to make large irrigation works possible and is largely relied upon, not only by those interested in local and private irrigation but by those entrusted with the expenditure and use of the moneys, now amounting to nearly \$3,000,000, apportioned to the State as its share of the national irrigation or "reclamation fund." The production of lignite has risen from 38,997 tons in 1895, to 166,601 tons in 1900 and 306,800 tons in 1902. So also, although there is comparatively little building stone in the State, with the exception of some excellent qualities of sandstone to be found in the western portion and the granite boulders scattered throughout the glaciated area, the soil is rich in valuable clays. Not only is nearly all of the brick used in the State made within its borders, but a large and growing trade is carried on with the Canadian Northwest, and large quantities of high grade facing and fire-brick are shipped throughout the West and Northwest of the United States. Pottery clays are also to be found in great abundance, while in the neighborhood of the Tongue River in Cavalier County are to be found rich deposits of argillaceous limestone which are being made into high grade Portland and natural hydraulic cements.

Flora and Fauna.—The forested area of the State is very small, mainly in the Pembina, Turtle Mountain, and Devil's Lake regions, where grow oak and ash, poplar and birch, willow and box-elder, plum and ball-cherry, and other deciduous trees. Along the Missouri are large cottonwoods. The characteristic wild animals are nearly all in the southwest, where are brown bears and a few grizzlies, timber and prairie

wolves, panthers, and wildcats, besides gophers, prairie-dogs and deer. Trappers also find otter, mink, beaver, raccoon, and badger. Sportmen shoot much grouse and prairie chicken, wild geese and wild ducks.

Climate and Rainfall.—The weather is severe in the winters, sometimes as low as -40° , but the very dry atmosphere—the precipitation during the winter not averaging over five inches—makes it less trying than damper climates with higher temperatures. The summer heat rises to about 95° . Spring usually begins in March. The rainfall steadily decreases from east to west, being about 20 inches in the Red River Valley and 10 at the Yellowstone. Three fourths of it falls in the growing season, April and August. The rain is sufficient for profitable farming for 100 miles west of the Red River; beyond that, the region is better suited to ranching. Irrigation is contemplated in the arid parts, and will greatly increase their agricultural development.

Soils and Agriculture.—The soil is by far the richest in the Red River Valley, a wonderful bottom-land, where the black rich top soil of decayed vegetation overlies alluvium and glacial drift to the depth of sometimes 300 feet, down to a clay which when near the surface is itself rich farming ground. The soil grows thinner to the westward on the plateau, and to the southwest. The great crop of North Dakota is wheat: the No. 1 hard spring wheat of the Scotch variety, which ranks as the foremost in the market and makes the best flour. In 1902 the crop was 116,342,677 bushels, valued at \$97,791,296. Other cereals were grown in immense volume: oats, 65,787,236 bushels; barley, 26,316,755 bushels; corn, 4,999,701 bushels. The value of these four crops together was over \$133,000,000. The next most important specialty to wheat is flaxseed, of which the State raises more than all the rest of the United States together: in 1900, 10,319,062 bushels, valued at \$14,347,036. The crop of potatoes was about 5,176,938 bushels. The garden produce nearly doubled in 1901 from 1900. Small fruits and grasses also grow in abundance; but orchard fruits are not much raised. In 1900 the State had over half a million neat cattle, besides 261,917 milch cows, 289,354 sheep, and some 331,585 swine. The wool clip in 1900 was 2,457,000 pounds. The exports of hay were very large. There are still millions of acres of unappropriated land in the State, besides 8,328,400 reserved, and the farming section has a great future.

Manufactures.—The State being a predominantly agricultural and cattle-raising one, the only considerable manufacturing industries which are not "neighborhood" manufactures, consumed near the point of production, are those of flour, potteries, and bricks. In 1900 there were 70 flour-mills, producing a value of \$4,134,023, or 45 per cent of the total manufacturing product of the State; in 1902 there were 84. In 1902 there were eight cheese factories and 38 creameries, and 926,005 tons of feed were turned out. Fargo and Grand Forks were the chief centres of manufacture, producing over 35 per cent of the total value of products, and employing over 48 per cent of the wage-earners. There were in 1900 753 establishments, employing 3,431 hands, paying \$2,422,000 in wages, and turning out a product valued at \$19,150,000. The articles included, besides the grain products, harness and

NORTH DAKOTA

saddlery (always important items in a ranching country), dairy products, brick and tile, pottery, fire-clay, and terra-cotta, fur and woolen goods, paper and tow, wire rope and cable and other wire work, carriages and wagons, furniture, lumber, timber, soda and mineral waters, tobacco, cigars, cement and binding-twine.

Banking.—All private banks have been compelled by a recent statute to take out charters as State banks. On 1 Sept., 1910, the number of national banks in operation was 149, their capital was \$5,280,750, their outstanding circulation \$1,458,788. There were also 143 state banks.

The total deposits of the 176 banks (an increase of 38 within the year) were over \$10,000,000; resources, \$9,603,699.96; reserves, \$13,437,076.88; loans and discounts, \$8,482,721.64, an increase of nearly 50 per cent in the year. There were six building and loan associations, with over 2,000 members.

Transportation Lines.—The Missouri is navigable throughout its length in the State, but needs a clever pilot. The Red River is navigable from Fargo to the end, but boats ordinarily run only from Grand Forks. The railroad systems are three, besides small local lines: the Great Northern and the Northern Pacific cross the entire State from east to west as part of their through lines, the former mostly north of the parallel of 48°, the latter a little south of 47°, and the Minneapolis, St. Paul & Sault Ste. Marie cuts it diagonally through the centre, connecting at the Canadian boundary with a branch of the Canadian Pacific. The Chicago & St. Paul and the Chicago & Northwestern also enter the State with short branches in the south; and the Bismarck, Washburn & Grand Forks has a section from Bismarck to Washburn open 45 miles along the Missouri. There were 3,300 miles of main track in the State at the end of 1902, an increase of 219 miles in two years, and business sections are well served.

Education.—The schools are managed by a board of commissioners composed of the governor, the superintendent of public instruction, and the president of the State University. The public schools of the State have a land endowment valued at \$50,000,000. One eighteenth of all lands were reserved for them at the outset by the constitution; making 2,531,200 acres, besides other gifts. None of these lands may be sold at less than \$10 per acre, and the State is obligated to make good any shortages. In 1902 there were 3,262 schools and 4,319 teachers, with 103,728 enrolled pupils; the expenditures on them by the State were \$1,670,093.28. The estimated value of the public school buildings and furnishings was \$2,889,000. There were, of institutions for higher and special education, an Agricultural College at Fargo, largely supported by Congress; a State University at Grand Forks, with a School of Mines connected therewith; a State Normal School at Valley City, and another at Mayville; a School of Forestry at Bottineau, and a Scientific School at Wahpeton, all provided for by the constitution and possessing large land grants. There are nearly 100 traveling libraries in use in the system. There are about 225 periodicals and newspapers published in the State.

Churches.—The chief religious bodies are the Swedish and Norwegian Lutherans, with 237 societies; the Methodists, with 215; Roman

Catholics, 121; Presbyterians, 115; Congregationalists, 104; Baptists, 67; Episcopalians, 35.

Charitable and Penal Institutions.—There is a State Insane Hospital at Jamestown; an Asylum for the Blind at Bathgate; an Institution for the Feeble-Minded at Grafton, with a new building lately opened; a Deaf and Dumb Asylum at Devil's Lake; a Soldiers' Home at Lisbon; an Industrial School and School for Manual Training at Ellendale; a State Penitentiary at Bismarck; and a State Reform School at Mandan.

State Government and Finances.—The governor is elected for two years, and receives \$3,000 a year. He has a veto by items. The State officers are elected in November of the even-numbered years. The legislature is composed of a Senate to consist of 30 to 50, and a House of Representatives to consist of 50 to 140; it now has 103. It meets biennially in January of the odd-numbered years, and the sessions are limited to 60 days. The supreme court has three justices, a chief and two associates; when the State has 600,000 people it may increase the number to five. Women may vote for school offices, and may hold them. Under the new apportionment of the census, the State sends two Representatives to Congress. It has been heavily Republican since its admission, except in 1892, when the Democratic-Populist fusion barely carried it; it is so at present by nearly two to one. The Democratic platform (1896) especially favored adequate taxation of corporations, and denounced "government by injunction." The State constitution makes it a misdemeanor for any one to interfere with another's obtaining, or enjoying after having obtained, employment from any one. It also provides for the prohibition of the liquor traffic. The assessed valuation of the State for 1910 was \$278,994,193. The State, by its constitution, is limited to a 4-mill tax, but the interest on the bonded debt, school tax, etc., raises it to 7.2. The balance in the treasury on 1 Jan. 1903 was \$670,409.35; the bonded debt (1910) \$1,151,300. The income during 1902 was \$2,125,232.24. A permanent sinking fund was established during the year, the interest-bearing warrants for current expenses, which had been much overdue and shunned by investors, were taken up, and the finances of the State put on a sound footing.

Population and Civil Divisions.—In 1880 the population of this section of what was then Dakota Territory was 36,305, excluding Indians; in 1890, it was 174,545, or 182,719 altogether; in 1900, 319,146 altogether. During the next few years the rapid development of coal mining property and other causes of emigration so added to the population of the State that in 1910 it was 577,056. In 1900 about 311,712 were white, 286 colored, 6,968 Indians, and 180 Chinese and Japanese. The foreign-born were 113,091; but as of these 25,004 were Canadian English, 2,009 English from England, 1,800 came from Scotland, and 2,670 from Ireland, of whom probably a third, or 800 to 900, were English and Scotch from the North; there were not over 70,000 of really alien blood. Of this mass, more than half were Scandinavians,—30,206 Norwegians, 8,419 Swedes, and 3,053 Danes; 14,079 Russians; 12,677 Germans from Germany and Austria; 3,164 French Canadians; 2,670 from Ireland altogether; 1,445 Bohemians;

700 Italians, and 353 Rumanians (Jews, as were nearly all the nominal Russians and some of the Germans).

The two chief places of the State are Fargo and Grand Forks, both on the Red River of the North, at the crossing respectively of the Northern Pacific and the Great Northern railroads. Fargo had 14,331 in 1910, having nearly tripled since 1890; Grand Forks had 7,652 in 1890, and 12,478 in 1910. The other towns of importance are Bismarck, the capital, 5,443, on the Missouri; Jamestown on the Dakota (James) River, and the N. P.; Valley City on the Sheyenne at the crossing of the N. P. and the M., St. P. & S. Ste. M.; Grafton on the Park west of the Red River in the north; Wahpeton on the Red River in the south; Dickinson on the Heart River in the southwest, on the Northern Pacific, and Minot in the northwest. The Indians are nearly all on four reservations: Standing Rock, on the Missouri in the southern centre; Fort Berthold, around the junction of the Little with the main Missouri; Devil's Lake, and Turtle Mountain. There are also several military posts; the largest is Fort Lincoln near Bismarck.

The State has 46 counties, as follows, with their capitals:

Adams, Hettinger.
Barnes, Valley City.
Benson, Minnewaukan.
Billings, Medora.
Bottineau, Bottineau.
Bowman, Bowman.
Burleigh, Bismarck.
Cass, Fargo.
Cavalier, Langdon.
Dickey, Ellendale.
Dunn, Manning.
Eddy, New Rockford.
Emmons, Williamsport.
Foster, Carrington.
Grand Forks, Grand Forks.
Griggs, Cooperstown.
Hettinger, Mott.
Kidder, Steele.
Lamoure, Lamoure.
Logan, Napoleon.
McHenry, Towson.
McKensia, Schafer.
McIntosh, Ashley.

McLean, Washburn.
Mercer, Stanton.
Morton, Mandan.
Mountrail, Stanley.
Nelson, Lakota.
Oliver, Sanger.
Pembina, Pembina.
Pierce, Rugby.
Ramsey, Devil's Lake.
Ransom, Lisbon.
Richland, Wahpeton.
Rolette, Rolla.
Sargent, Forman.
Sheridan, McClusky.
Sioux, Dickinson.
Steele, Sberbrooks.
Stutsman, Jamestown.
Towner, Towner.
Traill, Hillsboro.
Walsh, Grafton.
Ward, Minot.
Wells, Mandan.
Williams, Williston.

1876 it was proposed to set off the northern part as the Territory of Pembina, but political antagonisms had arisen, and the population of the Territory had increased to half a million before final action was taken dividing it into two States. The great Scandinavian immigration began about 1885. The State was admitted into the Union 2 Nov. 1889.

ANDREW A. BRUCE,
Associate Dean University of North Dakota.

North Dakota Agricultural College, opened in 1891, at Fargo. The regular four years' courses include agriculture, general science, and mechanical engineering; the shorter courses are agriculture and steam engineering, two years, and a "farm school" of three months; there are also courses in domestic science and military science. The college is open to women, and there are women on the faculty. The campus includes 640 acres; a new sewerage system connecting all buildings and grounds with the main sewer of Fargo was completed in 1901. The income, is derived mainly from State and Federal appropriations. The college organizes farmers' institutes in all parts of the State, under the supervision of the faculty; in 1910 18 such institutes were held, with an attendance of over 7,000. The faculty in 1910 numbered 85, and the students 1190, of whom about 400 were women.

North Dakota, State University of. The State University and School of Mines of North Dakota is located at Grand Forks. It was established by an act of the Territorial Legislature approved 27 Feb. 1883. The following colleges or departments have thus far been organized: The College of Law, granting the degree of LL.B.; The College of Liberal Arts, granting the degrees of B. A. and M. A.; The College of Mechanical and Electrical Engineering, granting the degrees of M. E. and B. E.; The College of Mining Engineering, granting the degree of E. M.; The Normal College; the School of Commerce; and the School of Pharmacy. The plant of the University consists of eight substantial buildings heated by steam and lighted by electricity. The University has received as a grant from the Federal Government 126,080 acres of land which, under the terms of the grant and of the state constitution, may not be sold for less than \$10 an acre. It is probable that this grant will eventually yield a fund of not less than \$2,000,000. The University is maintained by an annual fixed appropriation of two-fifths of a mill on the dollar of the assessed valuation of the State for purposes of taxation. The total income of the University for the current year is approximately \$100,000. The University owns, exclusive of its lands, property valued at \$500,000. Its library numbers 30,000 volumes. **E. J. BASCOCK.**

North Platte, plat, Neb., city, county-seat of Lincoln County, at the confluence of the North and South Platte rivers, and on the

History.—The old Territory of Dakota took its name, as did its river, from the Dakotas ("allies"), another name for the Sioux confederation. It formed a part of the Louisiana Purchase (q.v.) and when Lewis and Clark (see **LEWIS AND CLARK'S EXPEDITION**), were sent to explore the region in 1804, they wintered in the Mandan camps and were at the mouth of the Yellowstone in the spring. Lord Selkirk built a fort at Pembina in 1810, supposing it a part of his purchase from the Hudson's Bay Company. The first steamer ascended the Missouri in 1830. Fremont in his explorations penetrated to Devil's Lake in 1839. In 1832 George Catlin was here, and painted some of his famous Indian portraits. The first purchases of land from the Sioux were made in 1851. In 1857 the first settlement in Dakota was made at Sioux Falls, in South Dakota. When Minnesota was organized as a Territory in 1849, a portion of this district was assigned it. The Territory of Dakota was organized in 1861, and included Montana and parts of Wyoming and Idaho. The limits of the present North and South Dakota were fixed in 1868. Settlement was long checked by Indian wars, and the shelter taken here by the Sioux tribes expelled from Minnesota after the bloody outrages committed during the Civil War. In

NORTH POLE—NORTHAMPTON

Union Pacific railroad; about 220 miles in direct line west of Lincoln, the capital of the State. It is in a productive agricultural region where irrigation has been introduced, and in which there is a large acreage of alfalfa, sugar beets, corn, and wheat. Considerable attention is given to stock-raising. The railroad machine shops here employ several hundred men. It has grain elevators, a cold storage plant, stock yards, brick, coal, and lumber yards. It is the seat of a United States land office. The Y. M. C. A. library has about 2,200 volumes. Pop. (1890) 3,055; (1900) 3,640; (1910 est.) 4,000.

North Pole. See ARCTIC REGIONS; POLAR RESEARCH.

North River, the name given to the lower course of the Hudson River. This name was applied in the early days when the Delaware was called the South River. See HUDSON RIVER.

North Sea, or German Ocean, a north-eastern extension of the Atlantic Ocean lying between Great Britain and the continent of Europe; lat. 51° to 61° N.; lon. 2° $30'$ W. to 7° $30'$ E.; Great Britain with the Orkney and Shetland islands being on the west; Denmark and part of Norway on the east, Strait of Dover, part of France, Belgium, Holland, and Germany on the south; and the Arctic Ocean on the north. Extreme length, from the Strait of Dover to Uuaq, the most northern of the Shetland Isles, about 700 miles; greatest breadth, between Haddingtonshire, Scotland, and Denmark, about 420 miles; area, over 140,000 square miles. The shores of all the countries that surround the North Sea are deeply indented with bays, fiords, inlets, and large estuaries; but its most remarkable arm is the Skager Rack, between Denmark and Norway, which communicates through the Kattegat with the Baltic Sea. The North Sea is deepest on the Norwegian side, where the soundings give 190 fathoms; but the mean depth of the whole basin may be stated at no more than 31 fathoms. The bed of this sea is traversed by several enormous banks, one of which trends from the Firth of Forth, Scotland, in a northeasterly direction, to a distance of 110 miles; others run from Denmark and Jutland upward of 105 miles to the northwest; while the greatest of all, the Dogger Bank, occupies the centre of the sea, from lat. 54° $10'$ to 57° $24'$ N and lon. 1° to 6° $7'$ E. The great oceanic tidal wave which originates in the Atlantic, after having swept the west coasts of Great Britain and Ireland, enters the northern extremity of the North Sea, giving high water nearly simultaneously to the opposite shores of Scotland and Norway. Pursuing its course along the coasts of the former and of England, it rules the tides as far south as the Thames, making the tour of Great Britain in 18 hours. On entering the North Sea, on the north of Scotland, the tidal wave does not exceed 12 feet; but gradually increases to 14, 16, 18, and in the Humber to 30 feet; a difference of height depending on the figure of the shore, the form of the bottom, and the direction of incidence of the wave. The fisheries are extensive, especially on the Dogger Bank, on all the shores that bound it, and in the direction of the Orkney and Shetland Isles. The North Sea has been from the earliest times one of the most important highways of the world.

North Sydney, Canada, town and port of entry, Cape Breton Island and County, Province of Nova Scotia, on the northern side of Sydney Harbor, five miles north northwest of Sydney; and on the Intercolonial and the Nova Scotia Steel and Coal Company's R.R.'s. Coal is mined in large quantities and there are large shipping interests beside some smaller manufactures. It is the general shipping point for farm products and general merchandise going into Newfoundland. Religious services are held in five church edifices. There are two banks. Besides the public schools, Saint Joseph's Academy (Catholic) is located there. The town was first settled in 1793 by Loyalists and became incorporated in 1895. Its government consists of a mayor elected yearly and a council of eight members elected for two years. The population is mainly English, Scotch, and Irish. Pop. (1901) 4,640; (1910) about 5,000.

North Tonawanda, tōn-ə-wōn'də, N. Y., city in Niagara County; at the confluence of Niagara River and Tonawanda Creek, on the Erie Canal, and on the New York C. & H. R., the Erie, and the Lehigh V. R.R.'s; opposite Tonawanda, and 10 miles above Buffalo. Several other railroads, using leased tracks, and electric lines connect the city with Buffalo, Niagara Falls, and other places. North Tonawanda is in an agricultural region, but the city is noted for its manufacturing and commercial interests. It has large lumber yards, and the chief manufactures are steam pumps, merry-go-rounds, pig iron, bolts, nuts, steam piping, and a variety of lumber products. The public library has about 6,000 volumes. The charter of 1897 provides that the government shall be vested in a mayor, who holds office two years, and a council consisting of two members from each ward, and three at large. The city owns and operates the waterworks. Pop. (1910) 11,965.

Northampton, nōrth-āmp'ton, England, a city, capital of the county of same name, 66 miles northwest of London, on the left bank of the Nen, and on the London and Northwestern, and Midland R.R.'s. The principal buildings are the town hall; the shire or county hall, the county and borough jails, corn exchange, barracks, infirmary, theatre, etc. There are a free library, museum, schools of science and art, grammar school, mechanics' institute, an Athenaeum, and other literary and artistic societies. The benevolent institutions include the infirmary, a lunatic asylum, the Royal Victoria Dispensary, St. John's and Thomas-A-Becket hospitals, etc. The principal churches are All Saints', rebuilt in 1680, St. Peter's, restored in 1850; St. Giles', St. Sepulchre's, dating from the 12th century, and the Roman Catholic cathedral. The staple manufacture is boots and shoes for home and export trade, which employs about 12,000 hands. The curing of leather is also carried on on a large scale. The races, held on a race course, north of the

NORTHAMPTON—NORTHEAST BOUNDARY DISPUTE

town, attract great numbers of visitors. Besides two weekly markets there are 11 annual fairs. Pop. about 90,000.

Northampton, Mass., city, county-seat of Hampshire County; on the Connecticut River, and on the New York, N. H. & H. and the Boston & M. R.R.'s; 18 miles north of Springfield, 109 miles west of Boston, and about 140 miles from New York city. The largest part of the city is known as the "Center," and the remainder includes the villages of Bay State, Florence, and Leoda. Nearby are Mount Holyoke and Mount Tom, both with electric railroads to the summit. The city is on a height which commands a fine view of the river valley. It was settled 14 May 1654 by English colonists, and was named after Northampton in England. Jonathan Edwards (q.v.) lived here for some years. It was incorporated on 18 October of the same year, and chartered as a city 1 Jan. 1884. It is in a productive agricultural section, but it has extensive manufacturing and commercial interests. The chief manufacturing establishments are sewing-silk mills, basket and paper box factories, lumber mills, brush factory, hardware works, hosiery mills, sewing machine and furniture factories, machine shops, pulp mills, emery wheel works, and foundries. There are about 3,000 employees in the manufactories. The trade is principally in the manufactured articles and farm products. It has a number of fine buildings and prominent institutions, among which are the Dickinson Hospital, the State Asylum for the Insane (1903, 700 patients), and the opera house. The last mentioned, a gift from a native of the city, is owned and managed by the municipality. There are a number of fine church buildings. The educational institutions are Smith College (q.v.); the Buttrick Classical School for Girls; the Clarke Institute for Deaf Mutes, endowed by John Clarke; public and parish schools; three public libraries, gifts of natives of Northampton, and the "Home Culture Club," founded by George W. Cable (q.v.), and assisted by a gift of \$50,000 from Andrew Carnegie. The educational advantages of this club have been of great benefit to a large number of men and women; unique features are the instructions in household arts and amusements. The three national banks have a combined capital of \$650,000, and the three savings banks have a total deposit of \$4,975,000. The "Smith Charities" has peculiar features that make it a most remarkable and beneficent institution. It was founded by the will of a public benefactor, who desired to aid a special class of worthy persons. On certain conditions young men and women and widows receive annual gifts of money, young women receive gifts when they marry, and young men, who learn a trade, receive a certain sum of money when they attain the age of 21. The charter of 1883 provides for a board of aldermen and a council of 21 members elected annually by the people. The board of education and the trustees of the Forbes Library are chosen by popular vote. The city owns and operates the waterworks. Pop. (1864) 18,643; (1910) 19,431. Consult Trumbull, 'History of Northampton.'

JAMES H. HUNTINGTON,

Editorial Staff, 'Daily Hampshire Gazette.'

Northbridge, Mass., town in Worcester County; on the Mumford and the Blackstone rivers, and on the New York, N. H. & H. railroad; about 10 miles southeast of Worcester. It was settled in 1662 and remained a part of Mendon until 1772 when it was incorporated as a separate town. Its chief manufacturing establishments are large cotton and woolen mills, machine shops, furniture and cigar factories. The government is administered by annual town meetings. Pop. (1910) 8,807.

Northbrook, Baron. See BARKING, THOMAS GARGA.

Northcote, north/nbt, James, English artist: b. Plymouth, England, 22 Oct. 1746; d. London 13 July 1831. He early showed a taste for drawing and was encouraged to go to London, where he arrived (1771) with a letter of introduction to Sir Joshua Reynolds, under whom he worked for five years. He visited Italy in 1777 where he spent his time in copying the old masters, especially Titian. He returned to London in 1780, and six years later exhibited his first historical work, 'The Young Princes Murdered in the Tower.' Between 1783 and 1831 he exhibited no less than 229 historical paintings, taking subjects from English history or Shakespeare; these are chiefly remarkable for highly effective composition. The faces are Greek, the costumes absurd, the chiaroscuro fantastic and exaggerated, and the coloring inharmonious. His greatest skill is shown as an animal painter. His portraits are uneven, but those of men are better than those of women, while some of his children's and angels' faces are beautiful. This will be seen from his 'Portrait of Sir Simon Taylor'; 'A Dog and a Hawk'; 'Prince Arthur and Hubert'; 'Four Infant Angels in the Clouds.'

Northcote, Sir Stafford Henry, 1st Earl of ILMERSLEY, English statesman: b. London 27 Oct. 1818; d. there 12 Jan. 1887. He was educated at Eton and at Balliol College, Oxford, became private secretary to Gladstone in 1843; was called to the bar in 1847, and in 1851 succeeded his grandfather in the baronetcy. He sat in Parliament in 1855 for Dudley, in 1858 was elected member for Stamford, and in 1866 for North Devon, which he represented till 1885. In 1862 he published 'Twenty Years of Financial Policy.' In 1866 he became president of the Board of Trade; in 1867-8 was secretary for India; in 1871 a member of the high joint commission, which arranged the Treaty of Washington; and in 1874-80 was chancellor of the exchequer in the cabinet of Disraeli. After the Liberals returned to power in 1880 he became Conservative leader in the Commons, and in 1885 he was raised to the peerage, and appointed first lord of the treasury. Consult his published 'Letters and Essays' (1887); Lang, 'Life, Letters, and Diaries of Stafford Northcote' (1890).

Northeast Boundary Dispute, the disagreement between the United States and Great Britain from 1783 to 1842 respecting the northeast frontier. The Treaty of 1783 defined the northeast boundary of the United States, toward Canada, as extending from the source of the St. Croix due north to the highlands or watershed between the Atlantic and St. Lawrence systems, thence along those highlands to the northwesternmost head of the Connecticut River.

NORTHEAST CAPE—NORTHROP

Disputes arising over this definition, in 1831 the King of the Netherlands, as arbitrator, made an award which neither party was willing to accept. Finally, by the Webster-Ashburton Treaty of 1842, the present line was agreed upon, not greatly differing from that suggested by the Dutch king, and giving about seven twelfths of the disputed territory to the United States and about five twelfths to Great Britain. See **BOUNDARIES, AMERICAN**.

Northen, nôr'tên, Adolph, German painter: b. Münden, Prussia, 6 Nov. 1828; d. Düsseldorf 28 May 1876. He was a pupil in the Düsseldorf Academy from 1847 to 1851, when he devoted himself to the delineation of soldier life and battle scenes. In 1852 he began a series of pictures illustrating the wars of Napoleon I. These included 'The Battle of Belle Alliance' (1860); and 'The Retreat of the Grand Army.' To these he added scenes from the war with Denmark, and from the German-Austrian war 1866. His series portraying the last Franco-Prussian war includes 'The Storming of Weinberg'; 'The Transport of French Prisoners'; and 'The Charge of the 16th Uhlans on a Square.'

Norther. See **COLD WAVE**.

Northern Bear, in international politics, a name often applied to Russia.

Northern Drift, in geology, an obsolete name for the boulder-clay of the Pleistocene Period. The deposits were popularly supposed to have been brought by the polar currents from the far North.

Northern Giant, a name frequently applied in Europe to Russia, alluding to its size, growth, and population.

Northern Illinois College, a coeducational institution, in Fulton, Ill.; founded in 1861, opened in 1865; it last reported: professors and instructors, 12; students, 220; volumes in the library, 1,000; value of grounds, buildings, and scientific apparatus, \$110,000; total income, \$8,000. The departments are preparatory, collegiate, and the summer school. The courses lead to the degrees of A.B., B.S., Ph.B., and B.L. There is no endowment fund.

Northern Territory. See **SOUTH AUSTRALIA**.

Northfield, Mass., town in Franklin County; on the Central Vermont railroad; about 12 miles northeast of Greenfield, and 30 miles northwest of Fitchburg. It is famous as a centre of religious training. It is the birthplace of Dwight L. Moody (q.v.) and was his home and the scene of much of his work. The annual conferences of Christian workers and of students are held, in summer, in Northfield. The town is the seat of the Northfield Training School and of the Northfield Seminary for young women. The Mount Hermon School for Boys, in the adjacent town of Gill, is connected with the Northfield educational work. The town is in an agricultural region and its industries are connected with farm products. The govern-

ment is administered by town meetings. Pop. (1910) 1,642.

Northfield, Minn., city in Rice County; on the Cannon River, and on the Chicago G. W. and the Chicago, M. & St. P. R.R.'s; about 40 miles south by west of Saint Paul. It was settled in 1856 and in 1875 was chartered as a city. It is in a fertile agricultural section in which wheat is one of the principal crops. The chief manufactures are knit goods, dairy products, flour, and brick. It has considerable trade in grains and live stock. It is the seat of Saint Olaf College, opened in 1875 under the auspices of the Lutheran Church, and of Carleton College, opened in 1870 by Congregationalists. Other educational institutions are the Scoville Library, the Goodsell Observatory, and the public schools. It has the Odd Fellows' Orphans' and Widows' Asylum, a Y. M. C. A. building, and several fine churches. The city owns and operates the waterworks. Pop. (1890) 2,659; (1900) 3,210; (1910) 1,918.

Northfield, Vt., village in Washington County; on the Dog River, and on the Central Vermont railroad; about nine miles south by west of Montpelier. It is in a valley surrounded by low hills and mountains, Bald and Paine mountains are near. In the vicinity are black slate and granite quarries. The chief industries are connected with the quarrying of granite and slate, and with farm and dairy products. It has flour and lumber mills and woolen factories. It is the seat of the Norwich University, opened in 1834. The village owns and operates the electric light plant. Pop. (1890) 1,222; (1900) 1,508; (1910) 3,226.

Northington, nôr'thing-tôn, Robert Henley, 1st EARL OF, English statesman: b. about 1708; d. Grange, England, 14 Jan. 1772. He was educated at Oxford; in 1733 was called to the bar, and in 1747-57 sat in Parliament for Bath. In 1756 he was appointed attorney-general, and in the next year became lord keeper of the great seal and took his seat as speaker of the House of Lords over which he presided for three years. In 1761 he was made lord chancellor, and owing to ill-health resigned in 1767.

North'men. See **NORMANS**.

Northrop, nôr'thrûp, Birdsey Grant, American educator and clergyman: b. Kent, Conn., 18 July 1817; d. Clinton, Conn., 27 April 1898. He was graduated at Yale in 1841; and from its divinity school in 1845; and was subsequently a pastor of a Congregational Church at Saxonville, Mass., for 10 years. He was agent of the Massachusetts State Board of Education 1857-67 and secretary of the Board of Education of Connecticut 1857-67. He introduced the observance of Arbor Day in schools, and was considered as the 'father of Village Improvement Societies.' In 1872 he was invited by the Japanese government to establish a system of public education in Japan. Although he declined the honor he rendered such valuable service to that country that he was received as the guest of the Japanese nation.

Northrop, Cyrus, American educator: b. Ridgefield, Conn., 30 Sept. 1834. He was graduated from Yale in 1857, from its law school in 1859, and was admitted to the bar in 1860. He was clerk of the Connecticut House of Rep-

NORTHROP—NORTHWEST FRONTIER PROVINCE

representatives in 1862 and of its Senate in 1863. He became editor of the New Haven 'Palladium' in 1863 and in 1863-84 was professor of rhetoric and English literature at Yale. From 1869-81 he was collector of the port of New Haven; president University of Minnesota 1884-1908 when he resigned.

Northrop, Harry Pinckney, American Roman Catholic bishop: b. Charleston, S. C., 5 May 1842. He was graduated from Mount Saint Mary's College, Emmitsburg, Md., in 1860, studied four years in the theological seminary there and at the American College in Rome, and was ordained to the priesthood in 1865. He held several pastorates in his native city and elsewhere, and was consecrated bishop in 1882 as vicar apostolic of North Carolina, and titular bishop of Rosalia. In 1883 he was transferred by papal brief to the see of Charleston.

Northumberland, nôr-thûm'bër-land, John Dudley, Duke of, English statesman: b. England 1502; d. London 22 Aug. 1553. During the war with France 1544-5 he commanded the English squadron, and later was one of the executors of the will of Henry VIII. He schemed against Somerset, the Protector, and in 1550 was the dominant influence in the council. The next year he was created Duke of Northumberland, lord high steward, and earl marshal. His fourth son, Lord Guilford Dudley, married Lady Jane Grey in May 1553, and the duke persuaded Edward VI. to name her as his successor. Through Northumberland's influence she was placed on the throne 10 July, but on the 22d of August following he was executed for high treason.

Northumberland, Robert de Mowbray, EARL OF, English warrior: d. about 1125. He was a son of Roger de Montbray, a follower of William the Conqueror, and was made Earl of Northumberland some time not far from 1080. He was constantly engaged in feudal quarrels in the course of which he burned Bath and ravaged Wiltshire, and when Malcolm, king of Scots, invaded the country for a second time in 1093 he was met and slain by Mowbray at Alnwick. He raised an insurrection in 1095 and endeavored to wrest from the Conqueror's sons the crown and give it to their cousin, Count Stephen of Aumale. At first successful he was finally forced to retreat to his great castle of Bamborough where, after a stout resistance, he was finally taken, and though reports conflict, it is reasonably certain that the remaining 30 or more years of his life were spent in prison. He founded the priory at Tynemouth.

Northumberland, Earls of. See **PENY.**

Northumberland, England, a maritime county bordering on Scotland and on the North Sea; area 2,015 square miles. The county-seat is Newcastle-upon-Tyne, and other large towns are Wallsend and Tynemouth. The surface is diversified with hill, moorland, and valley, and its principal river is the Tyne. Coal mining and its supplemental industries place Northumberland high among the most productive counties of England.

Northumbria, England, an ancient Anglo-Saxon kingdom, one of the Heptarchy, which extended from the Humber to the Forth, and was bounded on the west by the kingdoms of

Strathclyde and Cumbria. The kingdom was founded by Ida, an Anglian chief, who invaded the country in 547. On the death of Ida in 560 part of it was incorporated in the kingdom of Deira, which occupied also what is now Yorkshire. Bernicia and Deira were united under Ethelfrith in 593. In 792 it was ravaged by the Danes, and again in 844 and 867, when they permanently settled in the country. Halfdene became sovereign, and portioned out the land among his followers. In the treaty which Alfred made with the invaders Northumbria was included in the Danelagh. Against Alfred's successors the Danes carried on a series of petty wars, till the dissolution of the kingdom of Northumbria in 950. It was then divided into the three earldoms or counties of Bernicia, Deira, and Lothian.

Northwest Boundary Dispute, the disagreement between the United States and Great Britain from 1814 to 1846, respecting the northwest frontier. The territory bounded north by latitude 54° 40', east by the Rocky Mountains, south by latitude 42°, and west by the Pacific Ocean had been claimed at various times and to various extents by Russia, Spain, Great Britain, and the United States. The Russian claim, which rested mainly upon occupation by fur traders, was settled by a treaty 11 Jan. 1825. Under this treaty the United States were to make no settlements north of latitude 54° 40', and Russia none south of that latitude. Great Britain and Russia agreed upon the same terms. The Spanish claims were confined south of latitude 42° by the treaty which ceded Florida in 1819. Great Britain had little or no claim by discovery. The United States' claim rested upon the voyage of Gray up the Columbia River in 1792 and the explorations of Lewis and Clark through the Rocky Mountains and through the Oregon country in 1805-6, under the orders of Jefferson. By the treaty of 20 Oct. 1818 the whole territory west of the Rocky Mountains was to be opened to both countries for 10 years, and, in 1827 the joint occupation for an indefinite period was agreed upon. Later this produced dissatisfaction, and after considerable negotiation, Great Britain was induced in 1846 to accept latitude 49° as the boundary from the Rocky Mountains to the channel between Vancouver's Island and the mainland. See **BOUNDARIES, AMERICAN; ALABAMA BOUNDARY COMMISSION.**

Northwest Company, The, an organization of French-Canadian traders who, in the 18th century, entered the fur trade as a rival of the Hudson's Bay Company, which had enjoyed a monopoly for 200 years. In 1805 the Northwest Company established trading posts on the Pacific coast and in 1813 absorbed the Pacific Fur Company, established by John Jacob Astor. In 1821 the Northwest Company consolidated with the Hudson's Bay Company. See **FUR TRADE, THE.**

Northwest Frontier Province, India. A new political and administrative province of British India, constituted 7 Nov. 1901, out of the province of the Punjab, consisting of portions of the district of Hazara, and the Trans-Indus districts of Peshawar, Kohat, Bannu, and Dera Ismail Khan, with the political charges of the mountain regions of

NORTHWEST PASSAGE—NORTHWEST PROVINCES

Kurram, Malakand (including Dir, Swat, and Chitral), Khybar, Tochi, Gomal, and Shirani. These mountain regions came under the suzerainty of the British Government during the recent Afghan Wars, and were designated by Lord Beaconsfield, "the scientific frontier of India." Up to that date, these mountain tribes nominally acknowledged the Amir of Kabul, and consequently regarded themselves as altogether independent of the British Government. It was this effort, on the part of the conservative administration of Great Britain, to separate these tribes from the quasi-authority of the Amir, and to bring them under the power of Great Britain, that was so strenuously resisted by the late Sher Ali Khan of Kabul, in January 1877, and which led to the Afghan War of 1878.

These mountain tribes are Afghans, speaking Pushto, the language of the Afghans, and are made up of a people trained to the use of arms from their youth. The annexation of these tribes to British India was, therefore, a most important event in the history of Hindustan. According to a report by Sir Lepel Griffin, the fighting power of these tribes is estimated as follows: Adjoining the Hazara district, Akkzais 1,000, Hassanzais 1,700; adjoining the Peshawar valley, Jadrans 2,500, Wazeerwals 2,000, Swatis 6,000, Utmankhels 5,000, Momunds 16,000; adjoining Peshawar and Kohat, Afreedis 23,500; adjoining Kohat, Bannu and Dera Ismail Khan, Orukzais 20,500, Saimooshts 4,500, Turis 5,000, Wazeeris 44,000; adjoining Dera Ismail Khan, Shoornees 5,000, Ustranas 900, Kusranis 1,500. These tribes, numbering more than 114,000 fighting men, are Afghans by birth and nationality, and Moslems of the Sunni sect, and they were consequently a constant menace to the peace of the Northwest frontier of India until they were brought under the control of the British Government.

This newly-formed province comprises an area of 16,466 square miles, with a population, mainly Mohammedans, of 2,125,480. The capital of the province is the ancient city of Peshawar, with a population of nearly 100,000. It is here that the chief commissioner of the province resides. There are deputy commissioners at Peshawar, Abbotabad, Kohat, and Dera Ismail Khan. Outside the native city of Peshawar there is a large military cantonment under a major-general commanding the "Frontier Force," with outlying stations of English and native troops at Nowshera; the corps of Guides at Murdan; native troops at Kohat, Bannu (or Edwardesabad), Dera Ismail Khan, and Abbotabad. At Cherat, on the Khattak hills, between Peshawar and Kohat, there is a sanitarium occupied by British troops during the hot season. A military force of Afreedis, under the command of a British officer, has been organized in the Khyber Pass, and there are forts at Jamrud, Alimusjid, and Lundi Kotal, commanding the Pass which is the highway to Kabul. The city of Kabul is 190 miles from Peshawar.

There is railway communication from India to Peshawar, crossing the river Indus at Attok, and running to the entrance of the Khyber Pass. There is also a railroad to Kohat, and to Dera Ismail Khan.

The Peshawar valley is watered by the Kabul River, which empties itself into the Indus at Attok; and the Derajat Valley is drained by the Kurram, and the Gambila rivers. On the left bank of the Kabul River is the district of Yusufzai, inhabited by an Afghan people speaking the Afghan language. The ancient fords crossing and commanding the River Indus and entering the Peshawar Valley, are at Attok, Hund, and Torbeyla. It is supposed that Alexander the Great crossed with his army at Hund, 331 B. C. Nearly all the invading armies of Northern India have passed through the Peshawar valley, hence the importance of this section of country. It was here that the Hon. Mountstuart Elphinstone held a political conference with Shah Shujah, the King of Kabul, in 1808. It was here that Sir John Lawrence signed a treaty with Sardar Gholam Hydar Khan, son of Dost Mohammed, Amir of Kabul, January 1857, and which is said to have kept the Afghans faithful to British interests during the Indian Mutiny which broke out at Meerut the May following. It was here that the political conference was held in January 1877, between Sir Lewis Pelly, K. C. B., representing the British Government, and Nur Mohammad Shah, representing the Amir of Kabul, which resulted in the British advance on Afghanistan the following year.

As a literary centre Peshawar claims to be the birthplace of the two popular Afghan poets who were contemporaries at the close of the seventeenth century: Abdur Rahman, whose grave is still to be seen in the village of Hazarkhana, near Peshawar, and Khushhal Khan Khuttuk, who died in 1691, and who is buried near Akora on the right bank of the Kabul River.

Throughout the Peshawar valley there are interesting and important Buddhist remains. The most notable of these are at Takh-i-Bhai, a short distance from Murdan, and the Gurkhatra in the centre of the City of Peshawar. The valley is said to have been frequently visited by Gautama, the founder of Buddhism. It is notoriously unhealthy, and is designated by the British soldier "the valley of death." The temperature ranges from a minimum of 17° in February to a maximum of 137° in July. The average rainfall is about 14 inches.

The principal agricultural products of the province are wheat, millet, jawar, cotton, rice, and indigo. The Peshawar valley is specially celebrated for its rice. The poppy plant is extensively grown in the Darajat. The cultivation of the land mainly depends upon artificial irrigation.

The chief towns of the province are Peshawar, Kohat, Dera Ismail Khan, Bannu (Edwardesabad), Abbotabad, Hurripur, Tank, and Kolachi.

THOMAS P. HUGHES,
Author of 'The Dictionary of Islam.'

Northwest Passage. See **ARCTIC REASONS; POLAR RESEARCH.**

Northwest Provinces, India, until 1901, the designation of a political division now THE UNITED PROVINCES OF AGRA AND OUDH. It is situated in the north central part of India, bounded on the north by Tibet and Nepal, on the

NORTHWEST TERRITORIES—NORTHWEST TERRITORY

east by Bengal, on the south by the states of the Central India Agency, and on the west by the Rajputana and the Punjab. It consists of Agra, 83,198 square miles; Oudh, 23,966 square miles; and the native states of Rampur, 899 square miles; and Garhwal, 4,180 square miles. Population Agra, 34,858,705; Oudh, 12,833,077; Rampur, 533,212; Garhwal, 268,885.

Northwest Territories, Canada, the political division comprising the territories of Assiniboua, Alberta, Saskatchewan, Athabasca, Mackenzie, Ungava, Franklin, Keewatin, and the Yukon Territory. The political division has an area of 2,634,880 square miles. (See CANADA: THE CANADIAN WEST; THE SETTLEMENT OF THE CANADIAN WEST; THE HUDSON'S BAY COMPANY; GEOGRAPHY.) This immense district (excluding Labrador) was known as the Hudson Bay Territory up till 1870, when the Hudson's Bay Company surrendered it to Canada for the sum of £300,000. The territories are governed by a lieutenant-governor and executive council, and a legislative assembly. Regina is the seat of government. The climate generally is of an Arctic character with long and rigorous winters, and short summers; the agricultural capabilities of a part of this region to the south, however, are very great. The fertile belt of the Saskatchewan alone contains an area of 64,000 square miles in one continuous strip of 800 miles long, with an average breadth of 80 miles. But the best and largest wheat area is beyond the Saskatchewan, in the valleys of the Athabasca and Peace rivers, and extending through the Peace River Pass to the western slope of the Rocky Mountains, and north to lat. 60° N. The lakes and rivers west of Lake Superior are bordered by rich prairies and luxuriant woods. Coal is abundant and is now worked, petroleum is plentiful; copper, silver, iron, salt, and gold have been found, the last especially on the Klondike River in the Yukon district. Great quantities of furs are obtained. The Canadian Pacific Railway crosses the southern part of this territory, and there are several other railways made or to be made. In the towns and villages springing up along the lines of railway free schools are established, and in the Rocky Mountain region five tracts of land have been reserved as national parks. Population about 115,000. See CANADA, NORTHWEST TERRITORIES OF.

Northwest Territory, the name given by the Continental Congress of America, in 1787, to a region east of the Mississippi, north of the Ohio, south and west of the Great Lakes, and west of Pennsylvania. The greater part of this territory belonged to France prior to 1763, when, by treaty, Great Britain became possessor of all the domain east of the Mississippi, in North America, which had been claimed by France. The territory west of the Alleghany Mountains and north of the Ohio River was, in 1774, annexed to the Province of Quebec. By the treaty of peace with Great Britain, at the close of the Revolutionary War, in 1783, this region was ceded to the United States. Its area was about 265,878 square miles, and it bordered on all the great interior waterways of North America which had then been explored; the Saint Lawrence River because a part of the Great Lakes not excluded. The exact status

of this territory was a subject of dispute for several years, on account of the conflicting claims of ownership of New York, Virginia, Connecticut, and Massachusetts. The States mentioned cited in support of their claims various early grants from the Crown, and conquests of Indian tribes. The original Colonial charter usually gave definite north, east, and south boundaries, but that of the west was often the sea, the South Sea, the ocean, etc., which was interpreted as Pacific Ocean. The other States of the Union refused to recognize the claims based on charters and acts as cited, but held that the lands in question should belong to the whole Union and should be administered for the common good. Congress in session, in 1780, gave a pledge to the Union that if the States claiming this western territory should cede it to the Confederation it should be used for the good of all the States, and should, in due time and under proper conditions, be admitted as States of the Union, with equal rights and privileges with the original States. New York was the first to cede her claims, in 1781; three years later Virginia ceded her claims, except a section north of the Ohio River (now the southern part of the State of Ohio) called for sometime the "Virginia Military District." In 1785 Massachusetts gave up her claims, and in 1786 Connecticut ceded all except a strip extending from the Pennsylvania boundary westward 120 miles, comprising about 6,000 square miles and called the "Western Reserve" (q.v.). Connecticut retained jurisdiction over this territory until 1800. A tract of 500,000 acres, in the western part of the "Western Reserve," was donated by Connecticut as "Fire Lands" to be divided as directed among such of its citizens as had been damaged by incursions of the British troops during the Revolutionary War. On 13 July 1787 the "Northwest Territory" was established by the Continental Congress. The ordinance was prepared by the chairman of the committee, Nathan Dane of Massachusetts. This ordinance provided for the enactment of certain rules deemed necessary for the public good, the chief provisions of which were (1) that not less than three nor more than five States should be formed out of the "Northwest Territory"; (2) that slavery should be prohibited forever within its borders; (3) that religious freedom should be wholly and entirely established and maintained; (4) that schools and means of education should be forever encouraged; (5) that the writ of habeas corpus and trial by jury should be guaranteed to all its inhabitants. A form of government was provided for and the territory was divided. It was further provided that when any one of the divisions had a population of 60,000, it might be admitted into the Union as a State. Certain conditions of admission were exacted in accordance with the Ordinance of 1787. The Continental Congress which established the "Northwest Territory" and so wisely provided for its admission into the Union, had its last roll-call to Oct. 1788.

The new Congress confirmed the Ordinance relating to this territory. At first the government was administered by means of a governor, secretary, and three judges appointed by Congress, who governed the whole as one district. The governor and judges sitting together had power to make and execute such laws as they

NORTHWESTERN COLLEGE—NORTON

deemed needful for the district, subject to the approval of Congress, until such time as the territory would have a legislature of its own. Provision was made for a legislature when there were in the territory 5,000 free male inhabitants of full age to be voters. This legislature was to consist of a Legislative Council of five members, chosen by Congress, and a House of Representatives chosen by male inhabitants who were freeholders. The first governor of the Northwest Territory, Arthur St. Clair, was appointed October 1787. He arrived at Marietta, the capital, July 1788. His first official act was the founding of Washington County. He appointed magistrates, established courts, arranged for defense against the Indians, and in every way sought to promote the advancement of the country. The first legislature of the Territory met 24 Sept. 1799. The House of Representatives had 22 members, representatives of the nine counties of the whole Territory. In May 1800, upon petition, Congress divided the Northwest Territory into two territorial governments; the boundary between which was a line extending from the mouth of the Kentucky River north to Canada. The portion east of this line was called "Territory Northwest of the River Ohio," and its capital was Chillicothe. The portion west of this line was called "Indiana Territory," and the capital was Vincennes. William Henry Harrison was first governor of the "Indiana Territory." Virginia completed her articles of cession 1 March 1784. On that same day Jefferson, as chairman of a committee, proposed a plan which was adopted by Congress 23 April 1784. The territory was to be divided into States, each State two degrees wide and the lines to be intersected by two meridians, one passing through the falls of the Ohio and the other through the mouth of Kanawha River. The States were to be named, Chersonesus, Assenisippia, Sylvania, Pelisippia, Illinois, Polypotamia, Washington, Mesopotamia, and Michigania. Slavery or involuntary servitude were to be allowed only as a punishment for crime. The plan never went into effect, and was superseded by the Ordinance of 1787 whereby the Northwest Territory was established as mentioned. In 1785, the year Massachusetts yielded her claims, Congress provided for a survey of the lands in dispute. Ohio, the first State formed out of the Northwest Territory, was admitted in 1803, and was the 17th State of the Union. Michigan Territory was created January 1805, and William Hull was first governor. It was admitted as a State in 1837. Illinois Territory was organized in 1809; Kaskaskia was the capital. It was admitted as a State on 3 Dec. 1818. Indiana was admitted as a State in 1816. A part of Michigan Territory was in 1836 organized as the Territory of Wisconsin. It became a State in 1837. A part of the Territory of Wisconsin is now the eastern part of Minnesota.

Northwestern College, a coeducational institution in Naperville, Ill.; founded by the Evangelical Association in 1861. In 1910 there were connected with the school 25 professors and instructors and nearly 500 students. The library contained about 6,000 volumes; the grounds and buildings were valued at \$120,000; the amount of productive funds was \$114,000; the income, about \$20,000, and the benefactions, \$12,500. The number of graduates is about 500.

Northwestern University, Ill., chartered under the auspices of the Methodist Episcopal Church, in 1851, and first opened in 1855. The first department organized was the collegiate department; the present organization includes (1) the College of Liberal Arts; (2) the Medical School, (3) the Law School; (4) the School of Pharmacy; (5) the Dental School; and (6) the School of Music; the College and the School of Music are at Evanston, Ill., and the professional schools in the city of Chicago. The university also maintains three secondary schools, namely, the academy at Evanston, Grand Prairie Seminary at Ormaga, Ill., and Elgin Academy at Elgin, Ill. The Garrett Biblical Institute, a theological school under separate management, is located on the college campus, and is in close co-operation with the university; the Norwegian-Danish Theological School and the Swedish Theological Seminary are affiliated with the institute. The work of the College of Liberal Arts is mainly elective, the courses being arranged for major work in one department and minor work in another; the degrees of A.B. and B.S. are conferred; the corresponding master's degrees and the degree of doctor of philosophy are conferred for graduate work. The government is by a board of 36 trustees elected by the board, to which are added 8 chosen by Church conferences. Women are admitted, and dormitories on the campus are provided for their use. The campus contains about 75 acres of ground, on the shores of Lake Michigan; the buildings include the old college, the first building erected, University Hall, the Fayerweather Hall of Science, the gymnasium, the observatory, and the library. The professional schools occupy their own buildings in Chicago, the law school, school of pharmacy, and dental school being in Northwestern University Building at the corner of Lake and Dearborn streets, and the medical school having two buildings on Dearborn Street, between 24th and 25th streets. There is a large athletic field, and the athletic affairs of the university are under the management of a committee of 15, 5 from the faculty, 5 from the alumni, and 5 from the students. The Students' Debating Society is affiliated with the Central Debating League, including the students' societies of the universities of Michigan, Chicago, and Minnesota; and with the Northern Oratorical League, including societies from the universities of Michigan, Wisconsin, Iowa, Chicago, Minnesota, and Oberlin College. The college library contains over 50,000 volumes, besides 35,000 pamphlets, and the professional schools have also special libraries. In 1910 the productive funds amounted to \$3,100,000, and the annual income was \$703,000; number of students in attendance, 4,106; number of professors and instructors, 395.

Norton, nôr'tôn, Andrews, American Unitarian theologian: b. Hingham, Mass., 31 Dec. 1766; d. Newport, R. I., 18 Sept. 1853. He was graduated at Harvard in 1804, and after studying theology was a tutor in Bowdoin College in 1809. He returned to Harvard in 1811 as mathematical tutor there; and became in 1813 librarian of the university and lecturer on Biblical criticism and interpretation. In 1819-30 he was Dexter professor of sacred literature. He

was among the most eminent exponents of Unitarianism, equally strong in his protests against Calvinism and the naturalistic theology represented by Theodore Parker. He published 'Reasons for not Believing the Doctrines of Trinitarians' (1833); 'The Genuineness of the Gospels' (1837-44); 'The Latest Form of Infidelity' (1839).

Norton, Caroline Elizabeth Sarah Sheridan, English poet and novelist: b. London 1808; d. there 15 March 1877. A granddaughter of Richard Brinsley Sheridan and a sister of Lady Dufferin, she showed her talent at 13 with 'The Dandies' Rout.' She was married to George Chapple Norton in 1827; procured for him a police magistracy by her influence with the Home Office; broke with her husband in 1836, when he accused Lord Melbourne (q.v.) of criminal intercourse with her; and was vindicated entirely of this charge in a famous suit, the basis of Dickens' *Bardell v. Pickwick*, in the 'Pickwick Papers.' Her differences with her husband were not then ended, for he claimed the custody of her children and the income from her writings. She wrote 'English Laws for Women in the Nineteenth Century,' a pamphlet which contributed to the change of English laws as to the status of women. Two weeks before her death Mrs. Norton married Sir William Stirling Maxwell. Her principal works are: 'The Sorrows of Rosalie' (1829), a Byronic poem; 'The Dream' (1840); 'The Lady of La Garaye' (1862), her best poem, which has much the tone of Campbell; 'A Voice from the Factories' (1836); and 'The Child of the Islands' (1845), both attacking social conditions; and the novels, partly autobiographical, 'Stuart of Dunleath' (1851), 'Lost and Saved' (1863), and 'Old Sir Douglas' (1867).

Norton, Charles Eliot, American scholar: b. Cambridge, Mass., 16 Nov. 1827; d. there 21 Oct. 1908. He was a son of Andrews Norton (q.v.) and after he was graduated from Harvard in 1849 was in the employ of a Boston establishment in the India trade. Except a voyage to India in 1849 and various trips to Europe his life was passed in the house where he was born. During the Civil War period he edited the papers of the Loyal Publication Society and with his friend, J. R. Lowell, edited the *North American Review* 1864-8. From 1875 to 1900 he was professor of the history of art at Harvard, becoming professor emeritus in the year last named. As a Harvard professor he exercised a salutary influence over successive generations of collegians before whom he has placed the highest ideas. The young men were helped by him to quicker perception of what culture really is as well as to discriminative discernment between true and false culture—between thoughtful, intelligent citizenship, and the noisy, puppyish assertion that so often passes itself off as patriotism. Few Americans have been sterner critics than he of whatever in American life falls below an ideal standard, and as a consequence few men, not professedly politicians, have been the target for so much adverse comment as was Professor Norton. Stigmatized often as unpatriotic he rose to a much higher level of patriotism than his critics. He enjoyed the friendship of many of the foremost personages of his time and was the

literary executor of such men as Lowell, Carlyle, Emerson, Curtis, and Ruskin. He was the foremost of American Dante scholars and was the founder of the American Dante Society, as well as of the Archaeological Institute of America, of which he was the president for many years. His published books include: 'Considerations on Some Recent Social Theories' (1863); 'The New Life of Dante' (1859, a partial translation with essays, followed by a complete translation); 'Notes of Travel and Study in Italy' (1860); 'Historical Study of Church Building in the Middle Ages' (1880); 'The Divine Comedy of Dante' (1891-2), a much prized prose translation. He also edited 'The Early Letters of Thomas Carlyle' (1886); 'Letters of James Russell Lowell' (1894).

Norton, Charles Led'yard, American author: b. Farmington, Conn., 11 June 1837. He was graduated at Yale in 1859; served in the Federal army during the Civil War; was editor of the 'Christian Union' 1869-79, and in 1893 became editor of 'Outing.' He has published 'Canoeing in Kanuckia' (1878), with J. Habberton; 'Handbook of Florida' (1890); 'A Medal of Honor Man; or, Cruising among Blockade-Runners' (1896); 'A Soldier of the Legion'; 'The Queen's Rangers'; 'Political Americanisms' (1890); etc.

Norton, Charles Stewart, American rear-admiral: b. Albany, N. Y., 10 Aug. 1836. He was graduated at the United States Naval Academy in 1855; became commander in 1870, captain in 1881, commodore in 1894; and was promoted rear-admiral in 1897. During the Civil War he served with honor at Charleston, Hampton Roads, and Port Royal. After the War he served on the board of inspection and survey; commanded the South Atlantic station in 1894-6, and was in charge of the Washington navy yard and station 1896-8. He was retired in the year last named, having reached the age limit.

Norton, Frank Henry, American journalist: b. Hingham, Mass., 20 March 1836. He was connected with the Astor Library in New York (1855-65) as assistant librarian and assistant superintendent, and entering journalism in 1872 was editor and owner of the New York 'Era' 1879-81, and from 1883 to 1891 on the staff of the New York *Herald*. Besides such dramatic burlesques, etc., as 'Alhambra,' 'Cupid and Psyche,' he has written 'Life of Alexander H. Stephens' (1883); 'The Malachite Cross' (1894); etc.

Norton, John, American colonial clergyman: b. Shortford, Hertfordshire, England, 6 May 1606; d. Boston, Mass., 5 April 1663. He was educated at Cambridge University, entered the ministry and in 1635 left England and came to Boston. He was pastor at Ipswich in 1636-52; then he succeeded John Cotton as colleague of John Wilson in the pastorate of the First Church of Boston. In this charge his influence steadily increased and his opinions came to be sought by officials of both church and state. He was still in this position when the colonies decided to send their petition to George II. in 1662, and was selected to accompany General Bradstreet; though the petition was nominally granted and Norton had without doubt performed his delicate task with fidelity, the colonies were dissatisfied with the results and hencefor-

ward his popularity waned. This change in public feeling was without doubt the cause of his death in the following year. He wrote: 'Responsio ad Totam Quaestionum Syllogem'; 'The Orthodox Evangelist' (1654); 'The Heart of New England Rent by the Blasphemies of the Present Generation' (1660); etc.

Norton, Lillian. See **NORDICA, LILLIAN**.

Norton, Sidney Augustus, American chemist: b. Bloomfield, Trumbull County, Ohio, 11 Jan. 1835. He was graduated from Union College, Schenectady, N. Y., in 1856 and from Miami Medical College in Cincinnati 1867, in which latter institution he was professor of chemistry 1867-72. In 1873 he became professor of chemistry in Ohio State University. He has published: 'Elements of Natural Philosophy' (1870); 'Essays and Notes' (1874); 'Elements of Physics' (1875); 'Elements of Inorganic Chemistry' (1878); 'Organic Chemistry' (1884); etc.

Norton, Thomas, English dramatist: b. Bedfordshire, England, 1532; d. England 1584. He collaborated with Sackville in writing 'The Tragedie of Gorboduc' (1560-1) which was the first English blank-verse tragedy.

Norton, Thomas Herbert, American chemist: b. Rushford, N. Y., 30 June 1851. He was graduated from Hamilton College, Clinton, N. Y., in 1873 and afterward studied at Heidelberg. From 1878 to 1883 he was manager of important chemical works in Paris, France, and was professor of chemistry in the University of Cincinnati 1883-1900. In May 1900 he was appointed to establish the United States consulate at Harput, Turkey.

Norton Sound, an arm of Bering Sea indenting the west shore of Alaska. It is about 220 miles long and 200 miles wide from Cape Nome to Cape Dyer. The Yukon is the largest river flowing into the Sound, a number of short streams enter from the north. The coast is irregular, the largest indentations are Golofnin and Norton bays and Golofnin Sound. A number of islands are along the coast, the largest are in the eastern part of the Sound. Nome (q.v.) is the most important city on the coast. Captain Cook discovered Norton Sound in 1778.

Norumbega, nò-rùm-bé'ga, a name given by the early explorers to various parts of the eastern coast of North America, also to a river, and to an Indian city. In 1539 the name was applied to the whole coast from Cape Breton to Florida, but this seems to have been on the authority of an anonymous narrative called 'Dieppe Captain.' The map of Verrazano's voyage, published in 1529, locates Aranbega on the coast of New England; Mercator's map, published in 1541, locates Anorumbega near the Hudson River; Gastaldi's map, 1556, locates Norumbega near Cape Breton. Other accounts mention Norumbega as a large river, brackish near the mouth; and still others picture it as a city with high towers and substantial houses. The rivers mentioned are supposed to have been Penobscot, Connecticut, or Hudson. Champlain, in 1605, applied the name to Maine and also to the Penobscot River. Humphrey Gilbert (q.v.) in 1583, began an exploration of the beautiful country of Norumbega, and so convinced was he of its existence, that he took with him a poet to

sing its praises. A map of 1582 marked Penobscot River a strait connecting the Saint Lawrence with the ocean at the mouth of the Penobscot. The country between was called Norumbega. The origin of the word has been attributed to many languages; as an Indian word meaning "still water"; a Spanish word meaning "fields"; a Norse word, *Norvegr*, meaning Norway; etc. In 1889 Prof. Horsford caused the erection of a memorial tower at the confluence of the Charles River and Stony Brook, near Watertown, Mass., in memory of Norumbega, a Norse city which once existed here. Considerable research has been given to the matter, and some historians claim to have reasonable proof of the origin and location of what by many is considered a mythical city or a name applied by different explorers to different rivers and locations on the coast between Cape Breton and Florida. Consult: Fiske, 'Dutch and Quaker Colonies in America'; Horsford, 'Defenses of Norumbega'; and 'Discovery of Ancient City of Norumbega'; Beauvois, 'La Norumbegue.'

Norval, nòr'vål, Young, son of Lady Randolph and her first husband, Sir Malcolm Douglas, in Homes' tragedy, 'Douglas' (1757). He is reared in obscurity and his identity is revealed to Lady Randolph only after he has saved the life of his stepfather. Glenalvon, the latter's heir, jealous of Norval, incites Lord Randolph's jealousy against him and a duel ensues in which Glenalvon is killed and Norval dies immediately after, whereupon Lady Randolph flings herself from a precipice. The part was much favored by both Kemble and Macready.

Norwalk, nòr'wåk, Conn., city in Fairfield County; on the Norwalk River, near Long Island Sound, and on the New York, N. H. & H. R.R.; about 30 miles east by north of New York city and 12 miles west by south of Bridgeport. Steamers ply regularly between Norwalk and New York. It was settled in 1649, and in 1651 was incorporated as a town, which included what is now South Norwalk (q.v.). Norwalk was incorporated as a borough in 1836 and in 1893 was chartered as a city. In 1779 it was plundered and burned by a British force under Generals Garth and Tryon. The chief manufactures are silks, felt goods, air compressors, locks, hats, shirts, corsets, shoes, worsted goods, and machinery. The coastwise trade, the oyster interests, and the shipping of farm products engage the attention of a number. Norwalk has a State Armory, the Fairfield County Children's Home, and the Norwalk Hospital. The Carnegie Library and the public and parish schools are the principal educational institutions. The city owns and operates the waterworks. Pop. (1910) 6,954. Consult: Byington, 'Ancient and Modern Norwalk' in the 'Connecticut Quarterly,' Vol. I.; Selleck, 'Norwalk.'

Norwalk, Ohio, city, county-seat of Huron County; on the Wheeling & L. E. (main line, and also Huron branch), Lake Shore & M. S., and Cleveland & S. W. R.R.'s; about 56 miles west by south of Cleveland and 10 miles south of Lake Erie. Huron County is one of the 10 counties which composed the "Western Reserve" or the "Connecticut Reserve." (See **WESTERN RESERVE**.) The city is connected with a number of villages, and cities by electric railroad. It was

NORWAY

settled in 1816 by Platt Benedict, Eliash Whitlery, and others; incorporated in 1828 and chartered in 1840. It is in a productive agricultural region, and has extensive manufacturing interests. The steel and iron works have 300 employees; piano factory, 400 employees; railroad shops, 400; printing works, 250; pyrography works, 150; canneries, 50; machine-shops, 100. There are a number of smaller industrial establishments each having from 5 to 20 employees. Norwalk has a large trade in its own manufactures and in farm and dairy products, fruit, and live-stock. It has a fine court-house, several well-built business blocks, and a number of handsome residences. The educational institutions are one central and four ward public schools, two parish schools (R.C.), and a Carnegie Library. There are 10 churches. The four banks have a combined capital of \$250,000; the amount of the annual business is \$1,350,000. The government is vested in a mayor, who holds office two years, and a council of six members chosen by popular vote. About three fourths of the population are native born, and the others are Germans and Irish. Pop. (1890) 7,195; (1900) 7,074; (1910) 7,858.

J. H. WILLIAMS,
Editor 'Norwalk Chronicle.'

Norway (Norwegian *Norge*; Swedish *Norriga* or *Norriga*, signifying North Kingdom), the western kingdom of the Scandinavian peninsula in the north of Europe, united 1814-1905 with Sweden (q.v.) so as to form the single monarchy of *Sverige och Norge*—Sweden and Norway,—and ruled 1873-1905 by Oscar II. Norway is bounded on the northeast by Russian Lapland, east by Sweden, and on all other sides by the sea, the Arctic Ocean being on the north, the Atlantic and the North Sea on the northwest and west, and the Skager-Rack on the south. From the Naze on the south, to a point adjoining the North Cape, the length southwest to northeast is about 1,080 miles; greatest breadth, measured nearly in the parallel of 60°, about 275 miles; area, 124,130 square miles. For administrative purposes Norway is divided into six provinces corresponding with the stifts, or dioceses, and subdivided into twenty bailiwicks (*amter*). The stifts are Christiania, Hamar, Christiansand, Bergen, Trondhjem, and Tromsø. Christiania is the capital.

Topography.—The coast consists for the most part of bold precipitous cliffs, and is remarkable for the vast number of islands by which it is lined, and the bays or fjords which narrow, deep, and winding, cut into it in all directions, providing an almost uninterrupted series of excellent natural harbors of refuge. Many of these fjords are deeper than the sea outside which averages 200 fathoms; Sogne Fjord, for instance is 2,820 feet deeper; Hardanger Fjord 930 feet; and Vest and Nord Fjords 840 feet. Some of these fjords penetrate great distances inland and send off numerous branching arms. The Sogne Fjord cuts its way to the foot of the Jotun Fjeld, 106 miles from the ocean, and Hardanger Fjord (q.v.) encircling the Folgefond is 68 miles long; the Jostedal lies between the Nord and Sogne Fjords. These three are the most characteristic of the fjords and offer some of the most sublime and accessible scenery in Norway. The surface generally is mountainous, particularly in the west and

north, the mountain masses, however, are of the form of great plateaus or tablelands called *fjelds*, fields or fells, as the Hardanger Fjeld, Dovre Fjeld, etc. The main range, the Kjølen or Kell Mountains from 3,000 to 6,000 feet high, runs parallel to the coast from the plateau of Finnmark in the north to 61° in the south and then divides, as the backbone of the peninsula forming the boundary with Sweden. The highest summits belong to the Sogne Fjeld, a congeries of elevated masses, glaciers, and snow fields in the centre of the south division of the kingdom, where rise Galdhøppingen 8,400 feet, the Glutretind 8,384 feet and Skagastølstind 7,879 feet. The line of perpetual snow ranges from 5,000 feet in the south to 3,000 feet in the north. In general the valleys are short and abrupt; and the streams, dashing down impetuously through rocky gorges, form numerous cascades. The leveler portions of plateau regions consist of dreary moors, covered in winter with snow and in summer with coarse grass and heather, studded with numerous tams and forest belts of conifers, birches, willows, etc. The grass affords pasturage to the sheep and cattle of the *dalsmen*. The *sætre* or huts of the herd-girls and the wood-cutters are the only habitations in the mountain solitudes.

Hydrography.—The short distance from the western slope to the western coast gives rise to a great number of minor streams, which proceed directly to the shore or the fjords. On the eastern slope the streams do not properly assume the character of rivers till they have run a considerable part of their course in Sweden. The few important rivers of Norway have a southerly direction in accordance with the general slope already referred to, and discharge themselves into the Skager-Rack; of these the longest are the Glommen 350 miles, Drammen 163 miles, with its tributary the Hallingdal 113 miles, Numedal Laagen 143 miles, and Otteren 140 miles. Some of these streams in their lower courses expand into long narrow lakes of considerable size: Lake Mjøsen is 60 miles long, and its bottom is 1,080 feet below the level of the sea; others are Randsfjord (43 miles long), Tyrifjord (19 miles), and Femund (35 miles long and 2,300 feet above sea-level). The most important rivers in the north are the Tana, which forms part of the boundary between Russia and Norway, and falls into the Arctic Ocean; and the Namsen, which falls into the Atlantic.

Geology and Mineral Resources.—The prevailing rocks of Norway are gneiss and mica-slate, of which all the loftier mountains are composed. Granite is of comparatively rare occurrence. On some of the plateau blocks of conglomerate occupy a large part of the surface. Porphyry, argillaceous schist, and limestone occur, but in very limited quantities, and rocks of volcanic formation are rare. Almost all parts of the country bear traces of the grinding action to which the structural rocks were subjected during the Glacial period. The minerals are numerous and abundant; the most important are iron, copper, silver, and cobalt, others are nickel, feldspar, and marble. For a century down to about 1870 the copper and iron mines of Røros and the silver mines of Kongsberg yielded considerable outputs; but have since declined. The principal mine is at Vigernes on Karmø, at the entrance to Bukken Fjord, which yields \$300,000 worth of pyrites in the year. The total mineral

NORWAY

output of Norway, iron pyrites, silver, copper, apatite, nickel, was valued at \$1,567,575 in 1900, showing an increase over preceding years. The silver mined was valued at \$24,500. Barely 2,000 men are employed in this occupation.

Climate.—Known as "The Land of the Midnight Sun," one third of Norway lies within the frozen zone and the greater part between the same degrees of latitude as Greenland. It would in all probability be still covered with a similar ice-cap to Greenland, as it was in the end of the Tertiary period, were its shores, west and north, not washed by the Gulf Stream. It is mainly owing to this warm oceanic artery that Norway is habitable; its influence, together with the direction of the parallel mountain rampart, the distribution of the atmospheric pressure, and the presence of deep-sea banks off the coast, determines the predominant climatological features of the country. The isotherms do not run from west to east, but parallel to the coast. The harbors on the west are never blocked with ice; while in places more inland, though much farther south, as at Christiania, this regularly happens. Hammerfest, for instance, on the north coast, in lat. 70° 40' N., has a winter mean of 22-6° F., 3° higher than Christiania, which has virtually an inland site, in lat. 59° 55' N. In winter the west coast districts are the warmest, and the cold increases in intensity according to the distance inland; whereas in summer the reverse is the case, though altitude is then a more potent influencing factor than in winter. The places that have the lowest winter mean (11.8°) are all inland, as Elverum and Roros (Røraas), near the Swedish frontier, Kautokeino (in southern Finmark), and Nyborg (at the head of Varanger Fjord); at all these places the mercury has been known to freeze (—40° F.). The places which have the highest summer temperature are Christiania, the southwest extremity of the country, the heads of the western fjords, and the interior of Finmark. The prevalent southwest winds bring considerable rainfall, 40 to 70 inches in the year, to the west coast of southern Norway. In the interior only 12 to 16 inches fall during the year.

Flora and Fauna.—In general the mountain slopes up to a certain height are clothed with magnificent pine forests, and at lower elevations the oak and the beech are by no means uncommon. In the loftier altitudes, below the snow line, willows, lichens, and numerous wild berries—cranberries, raspberries, bilberries, and cloudberries—are found in summer. Among wild animals are the bear, wolf, lynx, fox, wild reindeer, and lemming; buzzards, kestrels, and owls prey on the smaller animals and birds; snipe, loon and teal abound in the lakes; lapwings and plovers breed in the tams; in winter the ptarmigan is plentiful, and the eagle, sparrowhawk, woodcock, raven, and crow are common throughout the kingdom.

Forestry.—The forests cover about 26,300 square miles, of which 73 per cent are pine trees; 4,000 square miles are under state control. The area of late years has greatly diminished, but trees are being systematically planted in several parts, especially in the southern and eastern parts of the country. The trees are cut down principally in winter and floated down the streams in early spring to the sawmills at their mouths. The saw mills, wood pulp, and cellulose

factories, give employment to about 12,000 people. The export of manufactured lumber in 1901 amounted to over \$2,530,000, and of wood pulp over \$6,400,000.

Fisheries.—The fisheries are of great value, and contribute mainly to the support of the inhabitants along the seaboard, from the Naze to the entrance of the White Sea. The fisheries are divided into three chief divisions—Lofoden, Romedal, and Finmark. They include cod, herring, mackerel, salmon, shark, walrus, seal, and lobster fisheries, the cod and herring fisheries being by far the most important. Over 100,000 persons are employed in the fisheries, and the annual total value of the products of the fisheries considerably exceeds \$5,000,000, more than two thirds of which is for cod. The rivers and lakes abound with salmon and salmon-trout, and make Norway one of the best angling countries in the world.

Land Tenure, Agriculture, etc.—The farms are generally the property of those who cultivate them, small proprietors being common in Norway. They often include a large stretch of mountain-pasture, perhaps 40 or 50 miles from the homestead, to which the cattle are sent for several months in summer. Among the crops cultivated for food the principal is barley, which ripens at 70° of latitude; rye is successfully cultivated up to 69°; oats to 68°; but wheat not beyond 64°, and that only in the most favorable seasons. Another most valuable crop is potatoes, grown with success even in Finmark. Some hemp and flax are also produced, and in the southern part of the country some tobacco is grown. Fruit, too, particularly the apple, pear, and cherry, is raised generally in all the lower localities of the south and the centre. The grain raised falls far short of the consumption. One of the most extensive and profitable branches of rural economy is the rearing of cattle, for which many parts of the country are well adapted. The breeds, however, are inferior. The milk of the cows, however, is good, and enters largely into the food of the inhabitants; and butter is produced in such quantities that there is a considerable export trade of that commodity. Sheep are less numerous than goats, and yield a coarse though abundant and warm wool; swine are not viewed with much favor. The horses are vigorous and sure-footed, but of diminutive size; the ponies are among the best of their kind, and are often exported. Another domestic animal of great value is the reindeer, which forms the principal stock of the northern provinces.

Commerce.—The export trade is chiefly confined to raw produce. The principal items are timber, with wood-pulp and cellulose; fish, smoked and dry, with ice, fish-oil, etc.; also copper ore, iron pyrites, lucifer matches, paper, etc. The chief imports are grain, bacon, and other provisions, coals, textiles, wool, cotton, hemp, salt, sugar, coffee, tobacco, wine, brandy, etc. This trade is chiefly concentrated in the towns of Bergen, Christiania, and Trondhjem, though Drammen, Stavanger, Christiansand, and Arendal likewise have a considerable share in the commerce of the country. During the latter half of the 19th century the foreign commerce of Norway more than quadrupled; in 1901 the exports amounted to over \$41,400,000 and the imports to over \$76,000,000.

NORWAY.

VEBLUNGSNÆS AND RØMSDAL'S HORN

NORWAY

Manufactures.—These have made comparatively little progress, but are increasing since the protective system adopted by the non-renewal of the customs treaty with Sweden in 1897. The purely industrial establishments are grouped mainly around Christiania, and do not employ more than 45,000 persons. Besides those already mentioned, the more important are textile manufactures, machine-shops, chemical factories, iron and metal works, brick-works, flour-mills, tobacco-factories, breweries, and in a minor degree tanneries, distilleries, and factories for matches, glass, oil (fish and vegetable), and paper.

Shipping and Navigation.—For its population, Norway had a large mercantile navy, amounting in 1909 to 8,550 vessels (of which 1,645 were steamships), with an aggregate tonnage of 1,577,659. The Norwegians are among the busiest sea-carriers of the world. Ship-building and supplemental industries are carried on chiefly at Christiania in about 150 establishments employing over 3,000 men. The Norwegian ports were entered in 1909 by 12,924 vessels of 4,402,461 tons and cleared by 12,943 vessels of 4,422,323 tons.

Railways, Communications, etc.—In 1908 there were 1,605 miles of railroad, of which 1,354 miles were controlled by the state, and the rest operated by private companies; there were also 12,120 miles of telegraph and telephone lines, most of which also belong to the state with 77,049 miles of wire. The national and communal roads had an aggregate length of over 15,000 miles; the principal means of communication, however, are steamboats.

Weights, Measures, and Money.—The metric system (q.v.) of weights and measures was introduced in 1879 and became obligatory 1 July 1882. The unit of value is the Krone, equal to 100 öre, comparative value 27 cents; the 20 Krone gold piece weighing 8.96 grams contains 8.6645 grams of fine gold, and the silver Krone weighing 7.5 grams contains 6 grams of fine silver.

Banking.—There are two state banks, the Bank of Norway—'Norges Bank' and the 'Kongeriget Norges Hypothekbank' or Mortgage Bank of the Kingdom of Norway. The Bank of Norway, although a joint-stock bank, is largely owned by the state, is governed by state laws, and administered by directors elected by the parliament, excepting the president, who is appointed by the king. It is the only bank authorized to issue bank notes, and besides state business, is a general deposit, discount, circulation, and loan institution. Its assets in 1908 amounted to nearly \$30,000,000; its balance to about \$8,000,000. The 'Kongeriget Norges Hypothekbank' established by the state in 1852 to issue loans on mortgage, had in 1908 capital of over \$5,000,000, and a reserve fund of about \$250,000. The loans on mortgage amounted to more than \$43,000,000, and the bonds issued aggregated as much again. Private banking was represented by 93 joint-stock banks with a paid up capital of \$11,000,000, and there were 460 chartered savings banks, controlled by the minister of finance with over \$108,000,000 on deposit and 868,614 depositors.

Government, etc.—Norway is a constitutional and hereditary monarchy, the royal succession being in the direct male line in the order of primogeniture. If there is no male heir to the throne, the King may propose a suc-

cessor to the Storting (or legislative assembly), the assembly reserving the right to nominate another if it does not approve the King's choice. On June 7, 1905, Norway declared its union with Sweden dissolved, and an agreement to this effect was signed 26 October 1905. Prince Carl of Denmark was elected King 18 November, and accepted the crown as King Haakon VII November 20, 1905. His wife, whom he married 22 July 1896, was Princess Maud, the third daughter of the late Edward VII, of England. Their son, Prince Olav, Crown Prince, was born 2 July 1903.

The constitution, or Grundlov, bearing originally date of 17 May 1814, and many times amended, vests the legislative power in the Storting, which represented the sovereign power of the people. The King has the veto power, which may be twice exercised on a measure; but if the same bill passes three Storting which have been assembled by separate and subsequent elections, it becomes law without the royal approval. The King commands the army and navy, and makes all appointments, but, except in a few cases, is not allowed to nominate any but Norwegians to public offices under the crown. He exercises his authority through a Council of State, composed of one Minister of State and at least seven Councillors, who may be present in the Storting and take part in public discussions without voting. Local government is exercised by a chief executive functionary called the Amtmaend in each of the 20 districts into which the country is divided.

The ordinary revenues of the crown as shown by the budget for the year ending 30 June 1910, were 107,080,000 Kroner (the value of a Kroner being about 27 cents); extraordinary revenues, 7,273,200 Kroner; total revenue, 114,353,200 Kroner. The prospective expenditure, as listed in the budget of that time included State railways, 17,200,000 Kroner; army, 13,493,800 Kroner; post, telegraph, etc., 13,968,800 Kroner; Church, arts and education, 13,176,600 Kroner; interest on public debt, 11,105,700 Kroner, etc.

The most important fortresses of Norway are Oscarsborg and the new fortresses by Agdenes, Bergen, Tonsberg, and Kristiansand. The army of Norway is a national militia, somewhat resembling that of Switzerland. The navy consists of 4 war ships, 2 old coast service monitors, 3 gunboats, 3 destroyers, 29 torpedo boats, and one submarine.

Ethnology.—The Norwegians are almost entirely of Scandinavian origin. They are about the middle height, light-haired, and blue-eyed, sober and thrifty, honest and industrious, and where not devoted to a rural life have a strong passion for the sea, and make excellent sailors. The Finns or Lapons dwelling in Nordland, and more especially in Finnmark, bear little resemblance to the Norwegians proper. The Qvaens, though dwelling in the same localities with the Finns, are very easily distinguished from them both by physical features and habits.

Population.—In 1908 the population was estimated at 2,352,786. Illegitimacy is somewhat high, averaging 8.5 per cent of the births. The Laps numbered 19,545, and Finns 7,767. The population is more rural than urban, only about one sixth living in the towns. There is comparatively considerable emigration, the number in 1907 being 22,135, of whom 20,615 came to

NORWEGIAN LUTHERAN COLLEGE—NORWICH

the United States. From 1900 to 1908 the total increase in the population of Norway was 112,906.

Education.—Primary education is compulsory, and is conducted on a national system, according to which gratuitous elementary instruction is placed within the reach of all. The schools, designated by the name of *almuse skoler*, or people's schools, are stationed in all towns and parishes. In the country the instruction is only elementary; in the schools themselves an important distinction is made, some being what is called *fast skoler*, or stationary schools, and others *omgangs skoler*, or ambulatory schools. The latter, as their name implies, shift about at certain periods of the year, from place to place in the more thinly-peopled districts; and thus have the effect of bringing education to those who, but for this arrangement, would be doomed to live without it. Towns possess, in addition to these people's schools, what are called middle schools, middle and royal schools, burgher schools, Latin or learned schools, in all of which superior instruction is given; there are also four cathedral schools, one each in the towns of Christiania, Bergen, Trondhjem, and Christiansand. At the head of all the educational establishments is the Royal Frederick University of Christiania, with five faculties, 63 professors, which, in 1907, had 1,557 students. For *Language and Literature* see SCANDINAVIAN LANGUAGES AND LITERATURE.

Religion.—The great body of the people are Protestants of the Lutheran confession. Though no express law prohibited other religious bodies from meeting for public worship, the popular feeling was for long so decidedly opposed to it that a law, permitting them so to meet, and form regular congregations under their own pastors, was passed for the first time in 1845. Recently there were 52,680 dissenters, including 1,969 Roman Catholics. The country is divided into six bishoprics (stifts), corresponding in name and extent with the administrative provinces; and into 902 parishes. With exception of the cathedral of Trondhjem, founded 1180 or 1183 A.D., and a few other churches which are stone edifices, the churches in Norway are generally built of wood. Many of them are very ancient structures, dating as far back as the 11th and 12th centuries.

Judiciary.—Norway is divided into 108 districts for the administration of civil justice. Of these districts each with an inferior court, 26 are urban, and the rest rural courts, each with one chief, and two other judges, and a *Höiesteret*, or supreme court, for the whole kingdom, consisting of a president and a minimum of six other judges. In each town and district there is a *Forligelseskommisjon*, or court of mediation, consisting of two men chosen by the electors, before which civil cases are generally first brought.

History.—In the earliest times Norway was divided among petty kings or chiefs (jarls), and its people were notorious for their piratical habits (see *NORTHMEN*). Harold Fair Hair, who ruled from 863 to 933, succeeded in bringing the whole country under his sway, and was succeeded by his son Erick. He was ultimately driven from the throne, which was seized in 938 by his brother, Hako I., who had embraced Christianity in England. Magnus the Good, the son of Saint Olaf and Alfhild, an English lady

of noble birth, was called to the throne in 1036; and having in 1042 succeeded also to the throne of Denmark, united both under one monarchy (see *DENMARK*). After his death the crowns of Norway and Denmark again passed to different individuals. In 1319 the crown of Norway and Sweden became for a short time united in the person of Magnus V. Erick of Pomerania succeeded, by separate titles, to Norway, Sweden, and Denmark; and in 1397 was crowned king of the three kingdoms. Sweden then for a time became a separate kingdom; but the union between Denmark and Norway was drawn closer and closer, and very much to the disadvantage of the latter. The subsequent history of Norway becomes for a long period a part of that of Denmark. After the defeat of Napoleon by the allies in 1813 it was arranged by the treaty of Vienna in 1814 that Denmark must cede Norway to Sweden, and the result was the union of the two countries under the Swedish crown. The union has been accompanied with a certain amount of friction, partly owing to the entirely democratic character of the constitution of Norway, in which country titles of nobility were abolished early in the 19th century. The right claimed by the king to veto absolutely bills passed by elected representatives met with an overwhelming protest by the people, the struggle lasting till 1884. In 1905 a grave constitutional struggle arose between the two countries, from the demand for greater independence for Norway in her foreign policy. The situation developed an acute crisis over the refusal of King Oscar to grant separate consular service to Norway. On 7 June the Storting passed a resolution for dissolving the union of the two countries, and after a period of strained relations and warlike preparations a treaty was drawn up at Karlstad, the Swedish Riksdag officially adopting it on 16 October, thus recognizing Norway's independence. On 20 Nov. 1905 Prince Charles of Denmark accepted the throne, taking the title of Haakon VII. In 1907 a treaty guaranteeing the integrity of Norwegian territory was signed by Great Britain, France, Russia, and Germany, which was approved by Norway in 1908. In 1907, woman suffrage was adopted.

CHARLES LEONARD-STUART, B.A.,
Editorial Staff, 'Encyclopædia Americana.'

Norwegian Lutheran College, situated at Decorah, Iowa. It was founded in 1861 under the auspices of the Lutheran Church. There is a preparatory department, besides the regular collegiate department. The degree of A. B. is conferred. In 1905 the value of the productive funds was \$11,000; the annual income amounted to \$6,800; the library contained 13,438 volumes. The students numbered 195, and the faculty 13.

Norwich, nor'wich, Conn., city, county-seat of New London County; at the junction of the

NORWICH

Shetucket and Yantic rivers where they form the Thames, at the head of navigation on the Thames, and on the New York, N. H. & H. and the Vermont C. R.R.'s; about 14 miles from Long Island Sound, and 40 miles southeast of Hartford. It was settled in 1659 by a company of English from Saybrook, and the place was named after Norwich, England. It was incorporated as a township in 1685 and chartered as city in 1784. Its surface is irregular and it is surrounded by picturesque valleys and hills. The land around is productive but its exceptional water-power advantages have contributed to the extensive development of manufacturing industries. The chief manufactures are firearms, leather, silk fabrics, cotton and woolen goods, machinery, stoves, iron and iron products, and furniture. There are about 50 manufacturing establishments which have a total of 5,000 employees. It has a large trade in its own manufactures, lumber, farm products, coal, and clothing and food supplies for the interior of western Connecticut. It is the industrial and commercial centre of a large portion of New London and Windham counties. The educational institutions are public and parish schools, the Free Academy, built and endowed by public-spirited citizens, the Art Museum connected with the Academy, and the Otis Free Library, which has about 30,000 volumes. The prominent buildings are the Slater Memorial Hall, the State Armory, State Insane Hospital, the William Backus Hospital, the Y. M. C. A. building, the court-house, and Saint Patrick's Roman Catholic Church. There are several good church buildings and a large number of handsome residences. The Indian burying ground which contains the grave of Uncas, the place where Miantonomoh fell, the ruins of colonial homes, the places where once lived the Huntingtons, and others prominent in Revolutionary times, are all of historic interest.

The five national and three savings banks have a combined capital of \$1,600,000; the deposits are over \$24,000,000. The revised charter of 1877 provides for a mayor, who holds office two years, and a council of 12 members, six of whom are elected each year. The city owns and operates the waterworks. Pop. (1900) 17,251; (1910) 20,367. Consult Cautkins, 'History of Norwich.'

Norwich, nor'ij, England, capital of Norfolk, see of an extensive bishopric, the largest city on the eastern side of England; forms with its precincts a county of itself. It is on the river Wensum; 108 miles N.E. by N. of London (114 by rail); 19 miles W. of Yarmouth—the celebrated fishing port; 99 miles E.S.E. of the city of Lincoln. Norwich city proper extends more than a mile and a half in length from north to south on both sides of the Wensum, and a mile and a quarter in its greatest breadth. The geological formation consists of chalk, upper drift and crag; beds of sand and gravel.

Railways.—The first railway in Norfolk was from Norwich to Yarmouth 1 May 1844; that from Norwich to London July 1845. There are now three railway stations at Norwich. The Norwich electric tramway system, connecting all parts of the city, opened 30 July 1900, is in the hands of a private company.

Industries.—The great Colman factory—mustard, flour, and starch—represents the most important industry in Norwich, the premises on the river front extending three-quarters

of a mile. Boot and shoemaking and brewing are prominent manufactures, and Norwich has one of the largest organ manufactories in Great Britain, that of Messrs. Norman and Beard, Limited. Norwich market place is a very fine one, and the cattle market is one of the most commodious in England.

Public Buildings, etc.—The great Norman Castle was probably built by William Fitz Osbern, one of the Conqueror's captains, as a place of arms, and to overawe the subject Saxons. The keep, which remains, is nearly square, 92 by 96 feet, and 76 feet high; it is only exceeded in England by the Norman keep at Colchester, Essex. By public subscriptions the Castle, long used as a prison, was converted into a splendid Museum and Art Gallery, opened 23 Oct. 1894. The ornithological specimens in this Museum are of exceptional value.

The Cathedral is a grand Anglo-Norman pile, 407 feet long, and 72 feet broad, the spire reaching 315 feet from the ground. It contains several ancient chapels, a beautiful choir, and the cloisters are the most spacious in England except Gloucester. The Erpingham Gate and St. Ethelbert's Gate, which give entrance to the Upper Close are of considerable interest. In 1272 a great part of the church and the adjoining monastery were burned by the citizens, and many of the ecclesiastics killed. The Bishop's Palace north of the Cathedral, built by various prelates, is an extensive edifice. St. Andrew's Hall, anciently the nave of the Church of the Dominicans (Blackfriars), is a noble perpendicular structure, saved from spoliation by Henry VIII. through the public-spirited action of Augustine Steward, thrice Mayor of Norwich. It is now one of the handsomest civic halls in England; the walls are decorated with a number of valuable portraits, especially Beechey's Nelson, with others by Gainsborough, Lawrence, Opie, etc. The Guild Hall, succeeding the Tolhouse, where the king's tolls were paid, was built in 1413. In the Guild Hall corporation business is transacted.

The uninteresting Shire Hall (27 Sept. 1823) contains several portraits; in it the business of the shire, or county, is largely transacted. The Cavalry Barracks (1792, £20,000), Infantry Barracks (June 1888), Corn-Exchange (1861, £17,000), and Agricultural Hall (1882, £7,000) are commodious buildings adapted to their purposes. The Theatre (1826), often renovated, has no special features. The Grand Opera House (4 Aug. 1903), now the Hippodrome, is used for variety entertainments, a popular resort.

Antiquities.—This ancient city abounds in quaint relics of the past, and is notable for its antiques and curios. One of the show-places is Hercules and Samson House (Cubitt's), a large and very ancient mansion facing the Cathedral, the portico supported by ponderous figures of Hercules and Samson. It has great historical associations, its panelled rooms are filled with a choice collection of antique furniture, old china, and curios of every kind, freely open to visitors.

The Strangers' Hall, an ancient building, is a local museum in private hands, containing many interesting exhibits.

Hospitals.—The Norfolk and Norwich Hospital (1771, £21,000) is a fine institution, greatly extended of late years. There are near Norwich the extensive County and City Lunatic

NORWICH—NORWICH UNIVERSITY

Asylums, and minor agencies for the insane. The Jenny Lind Children's Hospital, founded by the great songstress, 1853; new infirmary built by public subscription, opened by Prince and Princess of Wales, 30 June 1900.

Libraries.—The Norfolk and Norwich Subscription Library contains over 20,000 well-selected volumes; reopened after destruction by fire 2 Aug. 1899. The Free Library (16 March 1857, £6,500) contains over 44,000 volumes in circulation, with good reference and local collections.

Churches.—Apart from the Cathedral, Norwich, with its suburbs, has 40 Anglican churches, some quite new, two in ruins. The chief churches of the Independents, Baptists, and Presbyterians, are large and well attended. Before the Black Death in 1349 Norwich city had twice as many churches as to-day, and came to be called "the City of Churches."

A magnificent Roman Catholic church, opened 29 Aug. 1894, is still unfinished; the whole immense cost is borne by the Duke of Norfolk, Earl Marshal, and premier duke of England.

Bridges and Parks.—This city had five bridges in the 13th century; there are now 11. Formerly called "A City of Gardens," Norwich has an ornamental little park in Chapel Field Gardens; the Castle Gardens are very ornamental, and several of the churchyards are planted with flowers; there are several recreation grounds.

Educational Facilities.—Norwich grammar school occupies a chancel-house (Bishop Salmon 1325) transferred there, and to adjacent buildings at the Reformation. There are also the commercial school, divided from the grammar school (28 July 1862, £2,000), and a large Technical Institute for Science and Art and Technical Instruction (opened 1899, cost about £22,000). The public schools are numerous, fitted up with the best modern appliances.

Government and Population.—Communal self-government, under a Reeve, was granted by a charter of Richard I in 1194, but in 1223 the government of the city was committed to four bailiffs, and so continued till January 1403-4, when Henry IV. granted that the city should be a county by itself, and the citizens were empowered to elect annually a mayor and two sheriffs. By a Municipal Reform Act (1835), one sheriff only was to be appointed. The city is now (1906) divided into 16 wards under the governance of a mayor, sheriff, 16 aldermen, and 48 councillors. Norwich first sent members to Parliament (2) in 1298, and still returns two members. Pop. (1811), 37,313; (1851), 68,706; (1881), 87,841; (1901), 111,728; (1906), 116,741.

History.—Many contradictory and mythical accounts have been given as to the beginnings of Norwich; until recently the accepted theory was that its first origin was the formation of the castle by some early Angle chieftain sailing up the river, piling up a great mound, and planting upon it a stockaded fort. But the latest authorities contend that the castle mound was thrown up by the Normans.

Between the 7th and 10th centuries East Anglia was the scene of continuous conflicts between the Saxons and the Danes. The first actual mention of the name of Norwich occurs

on coins minted there in the reign of Æthelstan (A. D. 925-941), and the earliest mention of it in any record is the statement in the *Saxon Chronicle* that in 1002 "Swegen came with his fleet to Northwic and wasted and burned the burh." Our first reliable glimpse of Norwich comes about 1050, when it could boast 1,320 burgesses, a number surpassed only by London and York, and was the residence of an Earl, East Anglia having been divided into four Earldoms by Canute (1017-1035). With the Norman Conquest came the building of the Castle, and in 1101 the dedication of the grand Cathedral by Losinga, first bishop of the diocese.

By a license from Henry III. the city was inclosed by a bank and a ditch (1253-1266); 41 years later a protecting wall, with towers and gates, was begun, which occupied 26 years in the building, and was accomplished by the munificence of Richard Spynk.

The most stirring events in Norwich arose from the Laborer's Revolt in 1381, and Kett's Rebellion in 1549. The former led by John Litester (the dyer) raided the city, but was soon routed by Despencer, the warrior-bishop of Norwich, and Litester was beheaded and quartered. Relentless taxation had infuriated the laborers and brought them to bay. Similar causes, also the inclosure of land previously of common right, and the suppression of the monasteries, stimulated Kett's rising. Robert Kett, a tanner, led some 20,000 men against Norwich, but, after some temporary successes, was defeated, leaving 3,500 dead upon the field, Kett himself being hanged from the parapets of Norwich Castle.

The Black Death, 1348-9, swept away a third of the inhabitants of Norwich, and the Plague of 1665-6 resulted in about 3,000 deaths.

This British Norwich is almost certainly the parent city of Norwich, Conn., for Miss Mary Perkins in her history of the latter (1895) says: "The Mohegan Indian fort may have suggested castle-crowned Norwich, perhaps, to the brothers Huntington, who are supposed to have emigrated from Norwich, England."

Norwich, nôr'wich, N. Y., village, county-seat of Chenango County; on the Chenango River, and on the Delaware, L. & W., and the New York, O. & W. R.R.'s; about 45 miles in direct line south by west of Utica and 35 miles north by east of Binghamton. It is the industrial and commercial centre of a productive agricultural region. The chief manufacturing establishments are blast furnaces, railroad shops, furniture factories, ribbon and glove factories, machine-shops and creameries. Perfumery, drugs, and patent medicines are also made and nearby are stone quarries. It has a free public library, a village hospital, and the county buildings. Pop. (1910) 7,422.

Norwich University, situated at Norwich, Vt. It was first chartered (1819) under the

NORWICH CRESTED CANARY—NOSE

name of American Literary, Scientific, and Military College and was situated at Middleton; in 1889 it was moved to its present site; and the name changed to Norwich University in 1834. The usual collegiate courses are offered; and in addition courses in civil and chemical engineering and military science; military drill is also a part of the curriculum. The chief work of the university has always been in science and engineering, and in 1898 it was made the official State military school, and receives a State appropriation. The degrees of bachelor of arts and bachelor of science are conferred. In 1910 the annual income amounted to \$41,000; the students numbered 180, and the faculty 14.

Norwich Crested Canary. See CANARY.

Norwood, Mass., town in Norfolk County; on the New York, N. H. & H. R.R.; about 12 miles southwest of Boston. It has a large printing establishment, a railroad repair shop, foundry, tanneries, glue and ink factories, machine-shops, and furniture factories. The educational institutions are the Morrill Memorial Library which contains about 8,000 volumes and the public schools. The government is administered by annual town meetings. The town owns and operates the waterworks. Pop. (1890) 3,733; (1900) 5,480; (1910) 8,014.

Norwood, Ohio, city in Hamilton County; on the Pennsylvania, the B. O. & S., the Cincinnati, L. & N., and the Norfolk & W. R.R.'s; northeast of and adjoining Cincinnati. It was settled in 1804, incorporated as a village in 1898, and chartered as a city in 1903. It is a beautiful residential hill-suburb of Cincinnati, and also a manufacturing city of considerable importance. The chief industrial establishments (1903) are playing-card factory, which has 2,300 employees; the elastic book-case works, 1,200 employees; electric manufacturing works, 1,000 employees; washing-machine factories, 600; foundry, 200; piano factory, 400; millwork works, 125; tool factory, 125; iron works, 150; enamel sign works, 50; lithography works, 250; and other establishments employing fully 1,000 men. Several of the manufacturing companies have buildings of considerable architectural merit. Other notable buildings are the town hall, Enterprise Block, Knights of Pythias Hall, the bank building and the eight churches. The educational institutions are five public schools (fine buildings), one parish school, and there are branch libraries of the Cincinnati public library. The First National Bank has a capital of \$1,000,000. The government is vested in a mayor, a council of eight members, and a board of public service consisting of three members, all elected by the people. The population is mostly native born Americans, some are of German descent. Pop. (1900) 6,480; (1910) 16,185.

SAMFORD KLINE,

Editor 'The Norwood Enterprise.'

Nose, that part of the face of man and the higher animals which is included in the mechanism of respiration, containing avenues for the passage of air to the lungs, and which also contains and accommodates the organs of smell; in a broader and looser sense, the muzzle. The nose in most animals is the most prominent feature of the face—least so in monkeys and lemurs, not much prolonged in the cats, but an important part of the prolonged muzzles of

other carnivora, and of the long-headed herbivorous animals generally. In several kinds of animals, otherwise widely diverse in structure and relationship, the fleshy part of the nose has been extended, through similarity of required service, into a more or less prolonged proboscis, as in the pigs, some shrews, certain seals, and, most prominently, the elephants. In these cases the nose performs other services than its usual functions, and becomes a tool for rooting, an organ of prehension, etc.

In structure, the nose consists of a series of bones of the face (see SKULL), together with certain cartilages, forming a tube or tubes holding the paired olfactory surfaces and nerves. The cavities of the nose are the two anterior nares, which open externally by the nostrils (in some of the lower animals, as the cetaceans, joined into a single one, the "blow-hole"); and the posterior nares, which are within the bones of the face and open interiorly into the mouth at the top of the windpipe. These cavities are separated by a more or less continuous cartilaginous partition called the septum, which is perforated by apertures for the transmission of blood-vessels and nerves. Occasionally the two nasal fossae or cavities communicate with each other.

The muscles which are concerned in the movements of the nasal cartilages include the triangularis (or compressor) nasi, which arises by its apex from the superior maxillary bone, and is inserted into a fibrous aponeurosis spreading over the front ridge of the nose. The fibres of the muscle of one side may unite with those of the opposite and companion muscle. The depressor alae nasi of each side also arises from the superior maxillary bone, and is inserted into the septum and posterior part of the ala of the nose. The former of these two muscles appears to increase the breadth of the nose, and thus may open, dilate, or expand the nostrils; the action of the latter muscle is that of a true compressor of the nostrils, each of the depressors drawing its ala or side of the nostril downward. The levator labii superioris alaeque nasi lies on the side of the nose, between the inner side of the orbit and the upper lip. When in action this muscle dilates the nose, raises the upper lip and ala of the nose; its use being well seen in the expression of a derisive smile, and in the wrinkling of the skin at the angles of the nose and mouth.

The skin of the nose is of delicate and smooth character. The papillae or minute elevations of the true skin in the neighborhood of the nose are described as being of smaller size than ordinary, while the supple skin or cuticle is of more than usually thin nature. The hairs of the skin are also of finer nature than in the other regions of the body; and the sebaceous or skin glands are very numerous, and possess short ducts, while their secretion is generally present in very abundant quantity.

There are three meat or compartments of the nose, which are formed in the outer wall or side of each of the nasal cavities by the turbinated bones. These compartments are of unequal size, and they communicate by apertures with certain spaces known as air-cells or sinuses, existing in the frontal, sphenoid, superior maxillary, and ethmoid bones. The upper or superior meatus is the smallest compartment, and occupies the posterior part of the nasal wall. It

NOSE AND THROAT

communicates with air-cells known as the posterior ethmoidal and sphenoidal sinuses. The middle meatus is a little larger. It communicates anteriorly through a passage or infundibulum with the anterior ethmoidal and frontal sinuses. The inferior meatus is the largest cavity, and occupies the greater part of the outer nasal wall. Into the front portion of the inferior meatus the nasal duct opens; this canal conveying the tears or lacrimal secretion from the eye to the nose. (See EYE.) Posteriorly to the extremity of the inferior meatus the aperture of the Eustachian tube, leading from the ear, may be seen.

The mucous membrane lining the nostrils and nasal cavities is also known as the pituitary membrane. It extends throughout the nasal sinuses, into the pharynx, into the nasal ducts and orbits, and through the Eustachian tubes, into the tympana and mastoid cells of the ear. (See MUCOUS MEMBRANE.) In the upper part of the nose, corresponding to the upper and middle turbinated bones and the ethmoidal portion of the septum—and termed the olfactory region, from the distribution at this part of the olfactory nerves—the mucous membrane has a covering of epithelial cells of the columnar variety, but non-ciliated. And beneath this layer, and also between the columnar epithelial cells, nucleated or olfactory cells are found. These latter cells form the terminal points as it were of the delicate ultimate filaments of the olfactory nerves, or the nerves of smell (see NOSE AND THROAT); and in this way the odoriferous particles drawn into the nostrils, and brought in contact with these cells, stimulate through them the olfactory nerves, and produce the sense or impression of smell.

The study of the comparative anatomy of the nasal organs shows us that man possesses a sense of smell greatly inferior in very many instances to that possessed by the lower animals. The distribution of the olfactory nerves in man is of a very limited nature when compared with what obtains in such animals as the dog, sheep, etc. And among these lower forms great differences are apparent in the kinds or qualities of odors most readily perceived or appreciated. The carnivorous mammals will in this way be most susceptible to the odors of other animals, and the herbivorous forms to those of plants.

Nose and Throat, Diseases of. In treating of the various aspects of the subjects here naturally combined, attention is first drawn to matters of anatomical structure, and the parts first presented for consideration are the anterior nasal cavities. These cavities mark the commencement of a continuation of passages which extend from the external orifices of the nose to the lungs. These are subdivided into anterior nares, nasopharynx, pharynx, and larynx. This series of continued passages constitute what is known as the respiratory tract. (See RESPIRATION.)

The anterior nares are the two nasal cavities (nostrils) separated by the nasal septum. The septum also serves to define this space, since its posterior border marks the dividing line between the anterior and posterior nares. Each naris consists of a nearly horizontal floor, an internal or septal wall, and two side walls tending to converge in the upper portion, leaving a narrow and irregular roof. The external wall

serves as an attachment for the series of the three turbinated bones.

Turbinated Bones.—These are scroll-like processes of bone attached to each lateral wall of the nasal cavity, one over the other, and projecting well into the lumen of the cavity. In the order of location they are known as the superior, middle, and inferior, the inferior being the largest and the longest of the three. The spaces between these bones, looking antero-posteriorly, are known as the superior, middle, and inferior meatuses.

The Nasal Septum.—The septum divides the anterior nasal cavity antero-posteriorly. It is partly cartilaginous and partly bony, the bony portion being made up of processes of the ethmoid bone and the vomer.

Accessory Sinuses.—Four groups of accessory sinuses communicate with the anterior nares. They are in pairs and are named as follows: The maxillary sinuses or antra of Highmore, the frontal, the ethmoidal, and the sphenoidal. The maxillary sinuses are situated one in each superior maxillary bone, for the most part occupying the space in the prominence of the cheek. They are irregular cavities, rather pyramidal in shape. The roof of the sinus constitutes the floor of the orbit, its floor being the alveolar process. Occasionally the teeth project into this cavity. The maxillary sinus opens into the nasal cavity in the middle meatus through a small tortuous canal, known as the ostium maxillare.

The frontal sinuses are located between the two tables of the skull, just over the orbit, and give rise to the prominence over each eye. They communicate with the nose.

The ethmoidal, better named ethmoid cells, are in series, and are located in the middle anterior and posterior portions of the ethmoid bone. These open into the nasal cavity.

The sphenoidal sinuses are located in the body of the sphenoid bone. They are each about the size of a bean, and open into the superior meatus. The opening of the lacrimal or nasal duct which leads from the lacrimal sac to the nose is in the anterior portion of the inferior meatus. The bony walls of the anterior nares together with the sinuses above described are completely covered by mucous membrane. This membrane is richly supplied with blood-vessels, lymphatic nerves, and glandular structures. The olfactory nerves descend through the cribriform plate of the ethmoid bone and cover the upper surface of the septum, the superior and middle turbinated bones. Most physiologists regard the function of the nasal cavities as three-fold in character, relating to respiration, olfaction, and phonation. The secretions are supposed to have a bactericidal power.

Rhinascopy.—This term denotes the methods used for examining the nasal passages, either through the anterior nares or the post-nasal space. The examinations may be made by direct or by reflected light. Various methods have been employed, the commonest being the student-lamp or ordinary gas-jet, with McKenzie's bull's-eye condenser. This, together with a reflecting head-mirror, enables the examiner to throw a light directly into these cavities. An electric head-light which does away with the use of a burner or indirect apparatus may be employed. When an anterior naris is examined the nostril is opened wide by the means

NOSE AND THROAT

of a nasal speculum. For examining the posterior nares a tongue-depressor and small hand-mirror must also be used.

Catarrh.—The term catarrh is used quite generally to designate the varieties of inflammation of the upper respiratory tract. This is contrary to the strict meaning of the term. It may, however, be used to define certain varieties of inflammation, which are no less distinctly recognized.

Inflammation.—The varieties of inflammation in the nasal cavity include: 1. Catarrhal inflammation, of which the acute variety is a simple inflammation of the nasal mucous membrane resulting from irritants, exposure to cold, or from infections (measles, scarlet fever, typhoid, diphtheria, grip, etc.), while rheumatism and gout sometimes induce catarrhal inflammations of the upper respiratory tract. Chronic catarrhal inflammation may result from a series of acute attacks, but is more particularly found as a local indication of systemic diseases such as syphilis, Bright's disease, gout, rheumatism, malaria, etc. 2. Membranous inflammation, of which there are three varieties: (a) croupous or pseudomembranous, an exudate without material organization and not due to specific bacteria, and which may be produced by escharotics or infectious fevers; (b) fibrinoplastic inflammation, which is characterized by the formation on the surface of the membrane of plastic material that seems to organize in layers, but is nonbacterial in origin; (c) diphtheritic inflammation, a more deep-seated exudate due to a specific germ, the Klebs-Löffler bacillus, or *Bacillus diphtheriae*.

Unlike the foregoing this false membrane when removed leaves a bleeding surface, showing that ulceration exists, which extends at least through the basement membrane.

3. Hemorrhagic inflammation, a violent inflammation of the mucous surface, characterized by interstitial hemorrhage.

4. Gangrenous inflammation, a type of inflammation which sometimes follows the acute infectious diseases in children. It may be due to burns, scalds, etc.

Specific Inflammations (Chronic Infectious Inflammations; Specific Granuloma).—These include actinomycosis, glanders, leprosy, syphilis, tuberculosis (q.v.), and rhinoscleroma, which is characterized by excessive thickening and swelling of the skin and mucous membrane of the nose, and is supposed to be due to *Bacillus rhinoscleromatis*.

Nasal Bacteria.—Owing to the peculiar construction and functions of the nasal cavities, together with the moist condition of the membrane, bacteria to a greater or less extent accumulate. The secretions of the nose and nasopharynx are supposed by most bacteriologists to possess considerable germicidal influence, as may be instanced by the fact that they are found in much larger numbers in the anterior nares than in the rhinopharynx. It may also be noted that even the more virulent types, especially the *Staphylococcus pyogenes*, *Micrococcus pneumoniae* (Frankel), *Bacillus tuberculosis*, Friedlander's pneumococcus, Klebs-Löffler bacillus (diphtheritic), and the streptococcus may be found and still not result in the development of the specific diseases of which they are supposed to be the causative factors.

Diseases of the Anterior Nasal Cavities.—Of these one of the most frequent is acute rhin-

itis (acute nasal catarrh, acute rhinorrhoea, catarrhal rhinitis, cold in the head, snuffles), an acute inflammation of the lining membrane of the nasal cavities, supposed to be the result of lowered vitality, confinement in overheated rooms, and prolonged mental strain, to which is added exposure to draft or sudden chilling of the body. Contributing causes may also be mentioned, such as deviation of the cartilaginous septum, stenosis, rheumatism, gout, chronic hypertrophy, and unsuitable clothing. Irritant drugs, the inhalation of dust, clippings, etc., may be considered as exciting causes.

Simple chronic rhinitis (chronic blennorrhoea, chronic nasal catarrh, chronic coryza, chronic rhinorrhoea) is a chronic inflammation of the nasal mucosa characterized by infiltration of the tissues and resulting from changes in the secretions and repeated acute attacks. In its hyperplastic form, owing to the increase of connective tissue in the nasal mucosa, it is accompanied by more or less nasal obstruction.

Ozena.—This is usually spoken of as a disease, but in reality is only a symptom. The conditions giving rise to its characteristic stench are not fully understood. By some it is considered to be simply a decomposition of the various fatty acids set free from certain intranasal inflammations. A more generally accepted opinion, however, is that the retained altered secretions undergo a putrefactive process as a result of the presence of saprophytic bacteria. The conditions usually present in the nose are those of atrophy and disease of the accessory sinuses. The odor is mainly confined to the large masses of crusts imbedded in the nasal cavities.

Atrophic Rhinitis.—This disorder, also known as atrophic catarrh, dry catarrh, dry rhinitis, fetid rhinitis, nasopharyngitis, ozena, and rhinitis sicca, may be described as atrophy of the nasal mucous membranes, accompanied by lessening of both the blood-supply and glandular secretion. The atrophic state has usually been preceded by a succession of inflammations accompanied by more or less hypertrophy of the tissues. In a large proportion of atrophic cases ozena is present.

Purulent rhinitis is a rare condition resulting from direct infection, and often mistaken for purulent conditions of the accessory cavities.

Nasal hydrorrhea is an obstructed nasal condition accompanied by an excessive flow of watery fluid from the nose, probably of reflex origin.

Nasal Syphilis.—A disease also called specific catarrh, specific rhinitis, and syphilitic rhinitis. It is an intranasal manifestation of syphilis, usually of the tertiary variety, accompanied with more or less necrosis of both soft tissues and bone. Occasionally the nasal mucous membrane may become the seat of the initial lesion. The intranasal lesions of the tertiary stage are severe and extensive and may involve the cartilaginous septum or the bony framework of the nose, resulting often in serious and extensive deformity. Wherever there are masses of necrosed bone the odor is exceedingly offensive, and frequently large pieces of broken down bone may be removed *en masse*.

Lupus (q.v.) is a skin-disease of which there are two distinct forms.

Furunculosis (phlegmonous rhinitis) is the

NOSE AND THROAT

formation of abscesses in any part of the nasal cavities.

Ulcers.—Small ulcers may form in various portions of the nasal cavity, but are usually found upon the septum, and result from foreign bodies, picking of the nose, and from a general systemic disturbance like diabetes. Malignant growths occur in the nose and do not differ essentially from those found elsewhere in the body. Infected ulcers, when occurring in nasal cavities, are due to some specific form of disease like syphilis, glanders, diphtheria, scarlet fever, smallpox, typhoid fever, or typhus fever, the type depending upon the nature of the accompanying disease.

Neuroses.—Neurosis of olfaction (smell) is a perversion of olfaction, a perception of imaginary odors frequently amounting to hallucination. Hyperosmia, overacuteness of olfaction, is supposed to be due to impairment of nerve-force. See ANOSMIA; SMELL.

Sneezing is a forcible and audible spasmodic expulsion of air through the nose and mouth caused by inhalation of irritating substances or by irritation of the vasomotor centres. See HAY FEVER.

Non-Inflammatory Diseases.—Of these, one of the most common is nosebleed (q.v.). Several varieties of foreign bodies are occasionally found in the anterior nasal space. Rhinoliths are developments of hard substances in the nasal mucosa formed from the deposit of mineral salts. Various animate foreign bodies may be found in the nose, such as insects, maggots, and intestinal worms. Of other foreign bodies, those placed in the nostrils by malingerers and children form the greater part, and consist chiefly of buttons, beans, peas, seeds, rags, etc.

Neoplasm of the Upper Respiratory Tract.—Non-malignant neoplasm (papilloma) is a benign wart-like growth made up of hypertrophied papillae, appearing rarely in nasal cavities, but occasionally seen in the pharynx and larynx. Adenoma is a benign tumor made up of connective tissue enclosing a large space filled with blood. Enchondroma in the nasal passages, is a cartilaginous growth, sometimes called chondroma, and is an offshoot from the cartilaginous septum. Exostosis is a bony growth projecting outward from the surface of the intranasal bony framework. Myxoma (nasal polypus) is the lowest grade of adult connective-tissue tumor; being a soft translucent growth made up of connective tissue and capillary vessels enclosed in a jelly-like matrix. They are usually pedunculated, multiple, and sometimes of large size; grayish in color, translucent, and have a small surface. They give rise to symptoms of intranasal pressure and obstruction, asthma, laryngeal cough, impairment of smell, and excessive watery discharge. As a rule the growth is associated with diseases of the accessory sinuses.

Malignant Tumors.—Carcinoma may have its origin in any part of the upper respiratory tract. It rapidly assumes grave proportions, and is amenable to operative interference only during incipency. The same may be said of sarcoma, which is a highly malignant tumor, having its origin in the deep connective tissue and gradually spreading to the mucous surface. It is nodulated and fungoid in appearance and tends to ulcerate in the later stages. See TUMOR.

Diseases of the Anterior Nasal Cavities.—Owing to the prominence of the nose and its

peculiar anatomical conformation, the septum becomes peculiarly liable to injuries and malformations, the most common of which is deviation or deflection. A deviated or deflected septum (usually limited to the cartilaginous portion) is a permanent change from the perpendicular to varying deformities. The deformities assume various shapes, with an occasional offshoot of a cartilaginous mass heretofore described as enchondroma. These often result in severe intranasal obstruction and require radical operative interference for relief. Synechia is a cartilaginous or fibrinous band extending from the septum to the nasal wall. A synechia may sometimes form between the turbinates. Septal ulcerations are usually due to picking of the nose, the desire for which may be induced by irritants, foreign bodies, and the inhaling of poisonous gases. They may also be syphilitic in origin. Septal perforations are openings through the cartilaginous septum. They are of varying sizes, and are due to extension of ulceration. Abscess of the septum is a collection of pus in the septal tissues, due to injuries or general systemic diseases. Depression of the nasal cartilage is a nasal deformity following extensive loss of septal tissue or of nasal bones, usually due to syphilis or injury.

Diseases of the Accessory Sinuses.—The maxillary sinuses are occasionally the seat of purulent inflammation, which may be acute or chronic. The collection of pus gives rise to pain, a sense of fulness, and discharge into the nasal cavity of the affected side. The condition is caused either by carious teeth, infectious rhinitis, or from the introduction of infection through abnormal communications from other diseased sinuses.

Transillumination is a method of diagnosis of antral disease, by means of which, having the patient in a dark room, a strong electric light is placed in the mouth and a comparison of the illumination made with the opposite side. Acute cases frequently recover by local treatment, but chronic cases usually require operative measures. The antrum may also become the seat of both benign and malignant growths.

Diseases of the Ethmoidal Cells.—These groups of cells, located in the ethmoid bone and communicating with the nasal cavities, are subject to both acute and chronic inflammatory and purulent diseases, the most common being the acute catarrhal inflammation occurring with general purulent rhinitis. The purulent form may occur on one or both sides, and may be associated with a suppurative condition of other accessory sinuses. When far advanced, it results in an enlargement of the middle turbinated bones, the walls of which become cystic, forming, with the broken-down tissues of the ethmoid, large cysts filled with pus or polypoid degeneration.

The sphenoidal sinuses are less frequently the seat of disease, although they may be the seat of the same diseases heretofore described as occurring in the other sinuses.

The anatomical relation of the frontal sinuses to the nasal cavities renders them liable to the development of both acute and chronic inflammatory conditions, purulent infections, and tumors.

Catarrhal inflammation, both acute and chronic, with its attendant supra-orbital pain and sense of weight and fulness in the fore-

NOSE AND THROAT

head, is occasionally present in connection with the same condition in the nasal cavities. Acute suppurative inflammation (empyema) is an acute suppuration brought about by the introduction of infection from the nose through the infundibulum. When long continued, the purulent process takes on the form of chronic purulent inflammation, in which there may be more or less necrosis of the bony walls and the development of polypoid degeneration. The severest forms are usually quite curable by means of operation.

Nasopharynx.—The nasopharynx is that section of the upper respiratory tract between the posterior border of the vomer and the level of the soft palate. The nasopharynx may be the seat of the following diseases: (1) acute nasopharyngitis (acute postnasal catarrh, acute rhinopharyngitis); (2) chronic nasopharyngitis; (3) atrophic pharyngitis (see *Atrophic Rhinitis* above); (4) hyperplastic nasopharyngitis; (5) specific inflammations (see *Pharynx* below, also *PHARYNX*, a separate article); (6) adenoid vegetations (see *Tonsils* below).

Acute nasopharyngitis is an acute inflammation of the mucous membrane lining the nasopharynx, usually accompanied by similar inflammations in the nose, pharynx, and larynx. Chronic nasopharyngitis is a chronic catarrhal inflammation resulting usually from repeated acute attacks and with the same causal relations. It is characterized by the presence of tenacious mucus, with more or less continuous efforts on the part of the victim to "hawk" and clear the throat. In the later stages the secretion shows a tendency to become thick, forming scabs and inspissated masses. This affection may result from the inflammation of irritating gases. Hyperplastic nasopharyngitis is a chronic inflammation resulting in the development of connective tissue in the mucous membrane.

Pharynx.—The pharynx is that portion of the upper respiratory tract bounded above by the soft palate and below by the upper borders of the larynx and oesophagus. The uvula, when normal, should be about $\frac{1}{4}$ of an inch long. It is occasionally bifid, and when it is greatly relaxed or enlarged the condition is described as elongation of the uvula. The uvula may be subject to inflammations, ulceration, tuberculosis, syphilis, and oedema. The same may be said of the soft palate, which is also subject to adhesions, in which there is an attachment or adhesion between the soft palate and the posterior wall of the pharynx. Adhesions of this character are due to the ravages of syphilis.

Tonsils.—The tonsils are a series of glands known as (1) the pharyngeal or Luschka's tonsil, also called adenoid vegetation; (2) the faucial tonsils, located on either side of the pharynx between the faucial pillars; (3) the lingual tonsils, a series of glands at the base of the tongue. Taken as a whole, they have been known as Waldeyer's ring. A visible hypertrophy or enlargement of any one of the series is usually accompanied by similar enlargement of the others. They form a part of the normal anatomical structures of the locality and, when diseased, call for operative interference.

Adenoid vegetation in the vault of the pharynx is an enlargement or hypertrophy of the glandular structures of the vault, due to disease. The presence of this condition is indicated by interference with nasal respiration, resulting in

mouth-breathing, especially at night, snoring, restlessness, "dend" voice, and often with considerable arrest in the progress of physical development. With these symptoms are frequently found narrowing of the nasal orifices, attacks of middle-ear suppuration, and narrowing of the chest-walls. The causes are variously described as climatic, inherited tendency, confinement in badly ventilated quarters, and neglect. The masses are found in the vault and on the posterior wall of the nasopharynx. Enlargement of these glands is considered to be extremely detrimental to child-life, and complete removal by operation offers the only means of cure and should always be done.

The faucial tonsils are located between the anterior and posterior faucial pillars, and normally are not visible to the eye. The lymphatic structure, however, is liable to pathological changes resulting in enlargement or hypertrophy. The enlargement may be slight, but the tonsils may become so much enlarged that they meet in the median line of the pharynx. The enlargement becomes much aggravated during the attacks of the various acute inflammations which may occur in this region. The faucial tonsils are subject to acute inflammation occurring with general pharyngitis.

Tonsillar and peritonsillar abscess (quinsy, phlegmonous tonsillitis) is a suppurative inflammation of the tonsil, accompanied by severe pain, fever, and swelling in the tonsillar or peritonsillar region, resulting in formation of abscess.

Follicular tonsillitis (lacunar and cryptic tonsillitis) is an acute inflammation of the tonsil attended with small fibrinous exudates in the crypts. It is accompanied by constant pain, chills, high temperature, and is supposed to be due to exposure to cold, climatic changes, and lowered vitality.

The causes of hypertrophied tonsils are chronic inflammation, inherited diathesis, gouty or rheumatic conditions, climatic influences, and the infectious diseases of childhood. The condition is accompanied by interference with respiration, more or less difficulty in swallowing, involvement of the Eustachian tube, anæmia, languor, and retarded physical development, all these symptoms being aggravated by the recumbent position. Tonsillotomy should be performed whenever there is sufficient enlargement to interfere with deglutition, respiration, or phonation. The instrument generally used for the removal of hypertrophied tonsils is known as the tonsillotome.

Caseous tonsillitis is a condition resulting from acute or chronic inflammation of the tonsils, in which the crypts show a tendency to fill up with various secretions. These masses show a tendency to ferment and form small foul-smelling caseous masses, which eventually squeeze out of the crypts. They may be removed by the means of a curet.

Mycosis of the tonsil and pharynx is an affection characterized by the development of small yellowish-white, clearly defined masses forming around the tonsillar crypts and frequently extending over the surface of the pharynx and the glands at the base of the tongue. It is supposed to be caused by *Leptothrix buccalis*.

Fish-bones, pins, and other foreign bodies occasionally find lodgment in the tonsil-crypts.

Lingual tonsil is made up of a mass of

NOSE AND THROAT

adenoid tissue located between the circumvallate papillae at the base of the tongue and the attachment of the epiglottis.

Disease of the Pharynx (acute inflammatory diseases of the pharynx, acute catarrhal pharyngitis), an inflammatory process, catarrhal in character, results from exposure to cold, and is usually attended with a like condition in the nose and larynx. It may also be due to gastric disorders and lowered vitality. There are many contributing causes, among which may be mentioned the exanthemata, bad ventilation, bad hygiene, insufficient clothing, overindulgence in alcohol and tobacco, and the inhaling of noxious gases. The disease is indicated by a certain dry painful condition of the pharyngeal walls, congested vessels, swelling, and sometimes oedema. Later on the dryness gives way to a more or less profuse secretion gradually becoming more tenacious and mucopurulent.

Infective pharyngitis (hospital sore throat, phlegmonous pharyngitis) is an inflammatory condition, attended with more or less exudate, occurring in individuals who are exposed for a prolonged period to septic influences. It is frequently found in the throats of physicians and nurses who care for diphtheria and scarlet-fever patients.

Croupous or simple membranous pharyngitis is an inflammation of the pharynx or tonsils attended with the development of a false membrane without the presence of any specific germ. Clinically the disease resembles diphtheria, but is in no sense to be considered as the same. (See *Diphtheria*). A positive diagnosis can be established only by bacteriological examination.

Ludwig's Angina.—This is a suppurative cellulitis occurring in the tissues of the neck, due to secondary infection from within the throat. Diphtheria, scarlet fever, and grip may be mentioned as exciting causes.

Chronic Inflammatory Diseases.—Simple chronic pharyngitis (clergyman's sore throat) is an inflammation of the pharynx resulting either from frequent acute inflammations or from overuse of the voice. Public speakers and singers are peculiarly liable to its development. It may also result from lesions of the liver, kidneys, lungs, and heart, or from the use of stimulants. The marked symptoms are hyperemia or congestion, with dryness, hoarseness, and a feeling of throat-tire.

Follicular pharyngitis (granular pharyngitis) may be defined as an inflammation in which the granular structures of the pharynx become chiefly involved. It is accompanied by hoarseness, irritation, and cough, together with the appearance on the posterior wall of small granular enlargements. The disease is supposed to result either from voice-strain or improper vocalization.

Atrophic pharyngitis (dry pharyngitis, pharyngitis sicca, atrophic pharyngitis) may be defined as a chronic inflammation resulting in pathological alterations in the structure of the mucous membrane of the pharynx and impairment of the muciparous glands. The disease is attended therefore by perverted secretion, with a burning, itching sensation in the throat, and extreme dryness. It is usually accompanied by atrophy of all the membranes of the upper respiratory tract.

Rheumatic pharyngitis (gouty sore throat,

rheumatic sore throat) is an affection that may be acute or chronic, and is due to the presence of some irritant in the blood. The uric-acid diathesis may be considered an exciting cause, and the disease responds to antirheumatic or antigout treatment.

Tuberculosis of the pharynx is a rare involvement, always secondary to pulmonary tuberculosis. Its presence is indicated by the formation of small tubercles upon the soft palate or pillars of the fauces. A positive diagnosis may be made by microscopical examination of the secretions.

Syphilis.—All three forms of syphilitic lesions may appear in the pharynx. The primary lesions are occasionally found upon the tonsils or other surfaces of the pharynx in the form of chancre. The mucus-patch is usually present at some period during the history of every case. The tertiary lesion or gumma may also develop in any of the pharyngeal structures often resulting in extensive ulceration and adhesion.

Glanders.—An infectious disease due to the *Bacillus mallei*, and communicated to man from animals, usually horses.

Retropharyngeal Abscess.—A suppurative inflammation in the posterior wall of the pharynx resulting in the development of abscess, which may burrow upward or downward, causing serious danger to life. The primary infection is usually due to inherited tuberculosis or syphilis.

Foreign Bodies in the Pharynx.—The exposed location of the pharynx, with its irregular surfaces, renders it peculiarly liable to the lodgment of foreign bodies. Among those rather frequently observed are fish-bones, pieces of other bone, shells, coins, pins, needles, sharp objects of various kinds, false teeth, etc.

The Larynx.—That section of the upper respiratory tract which occupies the space between the root of the tongue and the upper end of the trachea is called the larynx (q.v.). It is subject to a variety of diseases, among which are malformations and deformities. Congenital deformities in the larynx are rare. Congenital stenosis is a narrowing of the calibre of the larynx due to the formation of webs or bands stretching across the interior. Acquired stenosis is due to cicatricial contraction, traumatism, or syphilis. Tubercular ulceration may also be mentioned as a cause of stenosis of the larynx.

Acute catarrhal laryngitis (spurious croup) is an acute inflammatory process involving the mucous membrane of the larynx, and attended with hoarseness, dryness, and slight dyspnoea. The disease is caused by cold, exposure, gastrointestinal disturbances, nasal obstruction, bad ventilation, inhalation of irritating gases, and overuse of the voice. There is usually slight fever, cough, and in the later stages considerable expectoration.

Acute laryngitis in children (spasmodic croup, false croup) does not differ in etiology and pathology from ordinary acute laryngitis. The symptoms, however, are much more marked. The small calibre of the larynx in childhood, together with the greater elasticity of the tissues, renders the condition more serious. The engorgement is more rapid, and the symptoms of suffocation rapidly develop. The peculiar stridulous breathing, with frantic respiratory efforts and a hoarse barking cough, gives the disease an appearance of unusual severity.

The disease usually continues for three days, and is relieved by steam-inhalations, emetics, and laxatives.

For spasm of the glottis see LARYNGISMUS STRIDULUS.

Acute epiglottitis, inflammation of the epiglottis, is rarely entirely local except when due to swallowing an irritating substance. It is usually associated with inflammation of contiguous membranes. The chief symptom is a burning, smarting sensation, with a tendency to edema.

Edema of the larynx is an acute inflammation of the larynx accompanied by serous infiltration of the tissues, and resulting in marked interference with respiration.

Rheumatic laryngitis (laryngeal rheumatism, gouty sore throat) is an acute laryngitis directly traceable to a rheumatic or gouty diathesis.

Membranous laryngitis (true croup, membranous croup, diphtheritic croup, fibrinous croup, croupous laryngitis, laryngeal diphtheria) is an inflammation of the mucous membrane lining the larynx, manifesting the appearance of true diphtheria, but usually without the presence of Klebs-Löffler bacilli. Various forms of pathogenic bacteria are usually present. It may occur at any season of the year, and clinically it approaches so nearly to diphtheria that a positive diagnosis is most difficult. Many observers believe the condition to be exceedingly rare, and that true diphtheria is nearly always present wherever true membrane is found in the larynx.

Laryngeal diphtheria, without the presence of membrane in the pharynx or nose, sometimes occurs, the symptoms being quite similar to membranous laryngitis. The characteristic odor, however, is usually present, and the Klebs-Löffler bacilli may be found.

Hemorrhagic laryngitis may occur as a result of acute laryngitis, or from syphilis, tuberculous or malignant disease, or from rupture of a blood-vessel.

Simple chronic laryngitis (chronic catarrh of the larynx) is an inflammation involving both the superficial and deeper layers of the mucous membrane, with more or less of tissue-changes. The disease is supposed to result from repeated acute attacks. A subacute variety may be mentioned, but it cannot be clearly defined beyond stating that it is the commencement of the chronic form. Among other causes are the inhalation of irritating gases or dust, nasal obstruction, and improper use of the voice. The marked symptoms of this condition are hoarseness, a tickling sensation, with a tendency to clear the voice, slight cough, with considerable secretion, and occasional loss of voice.

Dry laryngitis (laryngitis sicca, atrophic laryngitis, laryngeal ozema) is always associated with a similar condition in the nose and nasopharynx, the symptoms of which have all been described.

Anemia of the larynx, when marked, is usually a local manifestation of general anemia.

Singers' nodules (chorditis tuberosa, trachoma of the vocal cords) are new-growth formations appearing on the margin of the vocal cords and usually at the junction of the middle and anterior thirds. They are small oval masses, sometimes developing upon both cords. While resulting from inflammation, the exciting

cause is no doubt the improper use of the vocal apparatus. There is marked interference with phonation and sometimes complete loss of voice. Treatment consists either of rest or the adoption of a system of vocal exercises which bring other series of muscles into activity. Local astringent applications have been employed.

Syphilis of the Larynx.—Both secondary and tertiary lesions of syphilis may appear in the larynx, mucous patches, however, being somewhat rare. The tertiary stage is of comparative frequency, and is manifested by the development of gummata, with destructive ulceration and subsequent cicatrization.

Tuberculosis of the Larynx.—This disease, also called consumption of the larynx, consumption of the throat, laryngeal phthisis, and tubercular laryngitis, is a specific inflammation of the larynx, the direct result of the tubercle bacillus. Tuberculosis of the larynx is rarely, if ever, a primary affection, and usually occurs as a manifestation of general tuberculosis. It begins with the development of minute miliary tubercles in the larynx, which eventually result in large swellings of the arytenoid cartilages. These subsequently break down, forming large ulcerations. Great suffering results, with dysphonia, dysphagia, continuous irritation of the larynx, progressive hoarseness, and irritating cough with excessive expectoration. In the late stages hemorrhage may occur. This form of tuberculosis is rapidly fatal, with but little hope of the patient's recovery.

Foreign Bodies in the Larynx.—Accidental entrance of foreign bodies into the larynx occasionally occurs. Foreign bodies usually enter during the process of swallowing, speaking, or breathing. The resulting danger depends much upon the character and size of the foreign body, and also upon its location. Liquid food and even small portions of solid food, are usually dislodged with little difficulty unless the entire calibre of the larynx is shut off. Foreign bodies may usually be seen by the ordinary methods resorted to for examining the interior of the larynx. They are removed by extraction by way of the mouth and larynx, or by external operation. Unfortunately the masses are sometimes drawn beyond the larynx into the bronchial tubes with fatal results.

Neuroses of the Larynx.—Of the various laryngeal symptoms sometimes resulting from impaired nerve-supply or from brain-lesions is spasmodic cough. This occurs more frequently in persons of neurotic type, although it may be of reflex origin. Anesthesia, paræsthesia, and hyperæsthesia of the larynx may be mentioned under this type of affections.

Hysterical aphonia is usually described as a sudden and complete loss of voice, occurring in unmarried females. The immediate existing cause is usually shock, fright, anger, or some other sudden emotion. The condition may remain for some time, and recovery may be sudden and unexpected and without treatment.

Laryngeal Vertigo.—This is a neurosis in which the dominant symptoms are a sudden strangling cough with vertigo and momentary loss of consciousness. It is a rare affection, and is usually associated with acute or chronic inflammation of the larynx, strongly influenced by fatigue or nervous excitement. The disease quickly responds to treatment.

Paralysis of the Vocal Cords.—Temporary

interference with the nerve-supply of the various muscles controlling the larynx, especially from local causes, is not infrequent. The paralysis following diphtheria and accidental poisoning is typical. A more severe form results from pressure from aneurism, cancer, phthisis, and syphilis. But lesions of the brain are by far the most destructive in results. Paralysis in this location may be either motor or sensory. Bilateral paralysis of the superior laryngeal nerve is both motor and sensory in character. The gravity of these conditions depends upon the cause. Bilateral abductor paralysis, on account of the approximations of the vocal cords without the muscular power to separate them for proper inhalation, is dangerous to life, inasmuch as a fatal attack of dyspnoea may occur at any time.

Intubation of the Larynx.—This process was devised and perfected by the American physician, Joseph O'Dwyer. It consists in placing a hollow tube within the larynx for the purpose of relieving dyspnoea. Intralaryngeal tumors sometimes tend to occlude the lumen of the larynx, and intubation is resorted to for the relief of the attendant dyspnoea. Intubation also serves as a method of relief in cases of laryngeal stricture. The operation is never attempted unless the patient's life is threatened by occlusion of the larynx or sudden spasm. The most common disease giving rise to the necessity for intubation is diphtheritic laryngitis.

Tracheotomy.—An operation whereby an external opening is made into the trachea below the larynx, through which a tube known as the tracheotomy-tube is inserted. It is performed for the relief of any obstruction to breathing. The site selected for entrance into the trachea may be high or low according to the nature and location of the obstruction.

Operations on the Larynx.—Thyrotomy consists of splitting the thyroid cartilage in the median line for the purpose of opening the larynx and removing growths or foreign bodies. Laryngectomy is an operation for the complete removal of the larynx, and is performed only in case of malignant growth. In cases where only part of the larynx is removed it is called partial laryngectomy. An artificial larynx is an instrument which in certain cases may be introduced after a laryngectomy, and which serves to fulfil some of the functions of the larynx. WENDELL C. PHILLIPS, M. D.,
Professor of Diseases of the Ear, New York
Post Graduate Medical School.

Nose-bleed, hemorrhage from the nose; epistaxis. This is the most frequent form of bleeding from a mucous membrane. It may be caused by direct injury, as by a blow upon the nose, a scratch within the nostril, etc., or may result from ulceration or other morbid growth in the nasal cavity. It is most common in children and young adults. When an active hemorrhage, it may be preceded by a feeling of tension and heat in the nostrils, pain in the forehead, giddiness, buzzing in the ears, flushing of the face. These symptoms are seldom all present in the same case, and in many instances the flow of blood is not preceded by any apparent disorder.

Nosebleed may also be of a passive character, as when due to a morbid state of the blood, for example, in typhoid fever, scarlet fever, purpura, scurvy, etc., or to obstruction of the circulation by disease of the heart and liver. In persons advanced in life it must be more cautiously interfered with than in the young. If the person so affected is plethoric, the hemorrhage is evidently of an active character, and is a natural relief, usually it will stop by the clotting of the blood in the nostril, or upon pressure of the wing of the nostril against the nasal septum. It may, however, go to an extreme extent, and require other means for checking. There are many methods of affecting this, but the application of cold water, snow, ice, etc., to the forehead, spine, or other parts of the body is the most general. Raising both arms suddenly above the head has been said to stop the flow quickly; or a small quantity of solution of alum, as strong as it can be made, may be thrown up with a syringe, or a piece of linen soaked in the solution may be stuffed up the nostril. From 10 to 15 drops of dilute sulphuric acid may be given in water at intervals, according to the nature and persistence of the attack. The application of cotton or a sponge, tannin, alum, etc., may be necessary under direction of a physician, who, in desperate cases, is needed for discovering the bleeding-point, and by whom plugging of the nostril may be resorted to.

Nosology, in medicine, that science which treats of the systematic arrangement or classification and nomenclature of diseases. Many systems of nosology have been in use at different times, some of which have been founded on the nature of the ascertained cause of disease; others on the pathological conditions which attend diseases; and still others on the differences between structural and functional diseases, and so on. The system introduced by William Farr, the London medical statistician, has in recent years been accepted as the most advantageous for statistical purposes. It is expanded most fully in the nomenclature of diseases issued in 1884 by the Royal College of Physicians and Surgeons. Ten years later this work was revised, and it is used in the United States as well as in Great Britain.

In Farr's system of nosology diseases are divided into four primary classes, which are subdivided into various orders. The classification is as follows:

First Class.—This class includes zymotic diseases, diseases which are either epidemic, endemic, or contagious, induced by some specific body, or by the want of food or by its bad quality. In this class there are four orders: (1) Miasmatic diseases, such as smallpox, measles, scarlatina, diphtheria, croup, whooping-cough, scarlet, typhus, typhoid, and yellow fevers, cholera, ague, boils, erysipelas, dysentery, rheumatism, diarrhoea, etc.; (2) enthetic diseases, such as syphilis, gonorrhoea, hydrophobia, leprosy, glanders, etc.; (3) dietetic diseases, such as famine, fever, scurvy, rickets, cretinism, delirium tremens, etc.; (4) parasitic diseases, as itch or scabies, worms, scald-head, etc.

Second Class.—In this class are included constitutional diseases, those affecting several organs, in which new morbid products are frequently deposited; sometimes hereditary. This class is divided into two orders: (1) Diathetic

diseases, such as gout, dropsy, cancer, cancer, mortification, dry gangrene, etc.; (2) tubercular diseases, as scrofula, phthisis, mesenteric tuberculosis, etc.

Third Class.—Local diseases are assigned to this class. These are the diseases in which the functions of particular organs or systems are disturbed or obliterated, with or without inflammation; sometimes hereditary. This class contains eight orders: (1) Diseases of the brain or, more strictly, of the nervous system, as apoplexy, paralysis, mania, epilepsy, hysteria, neuralgia, convulsions, etc.; (2) diseases of the heart or circulatory system, as carditis, valvular disease of the heart, aneurism of the heart and aorta, fainting, varicose veins, etc.; (3) diseases of the lungs or respiratory system, as bronchitis, laryngitis, pleurisy, asthma, pneumonia, tuberculosis, phthisis, etc.; (4) diseases of the bowels or digestive system, as gastritis, enteritis, jaundice, constipation, dyspepsia, pancreatic disease, etc.; (5) kidney diseases, as stone, gravel, diabetes, Bright's disease, etc.; (6) genetic diseases, as varicocele, uterine tumors, ovarian tumors and dropsy, etc.; (7) bone and muscle diseases, as caries, spinal curvature, necrosis, exostosis, soft and brittle bones, muscular atrophy, etc.; (8) skin diseases, as roseola, eczema, whitlow, impetigo, acne, etc.

Fourth Class.—Under this class are embraced developmental diseases, special diseases resulting from the formative, reproductive, and nutritive processes. This class includes four orders: (1) Developmental diseases of children, as malformations, idiocy, congenital deaf-dumbness, teething, etc.; (2) developmental diseases of women, as chlorosis, childbirth, paramenia, climacteria, etc.; (3) developmental diseases of old people, as old age and its concomitant affections; (4) diseases of nutrition, as atrophy, debility, etc.

Various other classifications have shown some advantages for special purposes; in fact different systems will always be required for different uses. Recent progress in bacteriology has necessitated modifications in nosological methods, and future advancements will do the same, while the methods of modern medicine lead to such classifications as best suit the requirements of scientific knowledge applied in ordinary practice.

Nossairians, nōs-sā'ri-ānz (Arabic for Nazareans), a subdivision of the Shiites, or followers of Ali, who hold that God has incorporated himself with some of their prophets, particularly with Ali, and Mohammed ben-Hamishah, his son. The Nossairians are charged with borrowing this doctrine from the Christians who teach the incarnation of God in Christ, hence they nickname them Nazareans. Consult Broughton, 'History of Religions.' See MOHAMMEDANISM.

Nossi-Bé, nōs-sé-bé', a volcanic island off the northwest coast of Madagascar; about 14 miles long and eight miles wide. In 1840 it was ceded to France by Madagascar, and when Madagascar became a possession of France, in 1896, Nossi-Bé became a part of the territory under the governor-general of Madagascar. Portions of the island are very fertile. Hellville, the chief city, is a port of call visited annually by a large number of ships. Pop. about 9,500. See MADAGASCAR.

Nostalgia (Greek, "homesickness"), a feeling of depression and anxiety due to absence from home or country. The victim of this disease is possessed with the desire to return, and often filled with apprehension and despair when the desire is without early prospect of being gratified. The condition is apt to be attended by loss of sleep, loss of appetite, often by emaciation, and various forms of physical malady, while the psychic disturbance sometimes leads to melancholia ending in mania and death. Nostalgia is especially liable to occur in cases of unwilling absence from home, as those of conscripts, etc. Even soldiers voluntarily serving far from home are often great sufferers from this disease, inasmuch that army medical officers have come to recognize it in its extreme severity as a disability warranting furlough, or even discharge, in order to save the patient's life. This aspect of nostalgia has recently been impressively illustrated in the United States army in the Philippines.

Nostradamus, nōs-trā-dā'mūs (true name MICHEL DE NOTREDAME), French physician and astrologer: b. Saint Remy, Provence, 14 Dec. 1503; d. Salon 2 July 1566. He was of Jewish descent, studied first at Avignon, and then at the medical school of Montpellier, and after taking his degree acted for some time as a professor, but afterward settled as a medical practitioner at Agen. Finally, after traveling in Italy, he established himself at Salon, near Aix, about 1544, where he wrote his famous 'Prophéties' (Centuries) or astrological predictions written in rhymed quatrains. They obtained great success; Catherine de' Medici invited him to court to cast the horoscope of her sons; and on the accession of Charles IX. he was appointed royal physician. In 1550 he published an almanac containing weather predictions. Consult: Bereste, 'Nostradamus' (1842).

Nostrils. See NOSE AND THROAT; NOSEBLEED.

Nos'trum, a derogatory term for quack remedies and medicines, and for certain patented remedies which have proven worthless or injurious.

Nota, nō'tā, Alberto, Italian dramatic poet: b. Turin 15 Nov. 1755; d. there 18 April 1847. He was carefully educated and after studying law practised for a long time as an advocate, and held important appointments under government until the political circumstances of Italy obliged him to retire from public life. The comic element is weak in him, the plot usually very simple, and the events taken from ordinary life. On the other hand he excels particularly in his delineations of character, and most irregular natures are presented with extraordinary skill. Of his numerous dramas 'La Fiera' (1826), a graphic and amusing description of manners, is perhaps the best. Among others may be named 'Il Filosofo celibe' (1811); 'La novella sposa' (1826); 'Il Torquato Tasso' (1826). Twelve editions of his works appeared between 1816 and 1843, the last Italian edition 'Comedie di Alberto Nota' (8 vols.) appearing 1843-3.

Notables, Assembly of, in French history, signifies the deputies of the states who were appointed and convoked by the king. In the early history of France mention is several times made of the notables; but the first assembly of any

NOTARY—NOTATION

importance was in 1558. From 1626 no such assembly was again called, till in 1786 the minister and comptroller-general Calonne conceived the idea of summoning the notables for the purpose of effecting several arrangements which he considered necessary; and there were accordingly assembled 7 princes of the blood, 9 dukes and peers, 8 field-marshal, 22 noblemen, 8 counselors of state, 4 masters of requests, 11 archbishops, 37 chief justices, 12 deputies, the civil lieutenant, and 25 magistrates of the different cities of the kingdom, making in all 144 persons. This assembly forms an epoch in the modern history of France. A second meeting of the notables was called in November 1788 to consult on the manner of assembling the States-General. See FRANCE, History.

Notary, or Notary Public (Latin, *notarius*, from *nota*, mark), originally denoted, with the Romans, those slaves or freedmen who acted as stenographers (making use of certain abbreviations, signs, *notae*), particularly in the meetings of the senate. In later times the *notarii* were the secretaries of public authorities. From the Romans the name passed over to the nations of Western Europe; and in modern times a notary is a witness, appointed as such by government, whose testimony is in some cases useful, to give credibility to instruments; in other cases is required by law to give them full validity, as, for instance, in protests of bills of exchange, etc. In France the importance of the notary was, and still is, greater than anywhere else. He is not only a public witness for every one who wishes his testimony, but he is also the great witness of government. He makes all contracts, mortgages, and other deeds and conveyances where the property in question amounts to more than 150 francs.

In Great Britain and the United States a notary public is a person who publicly attests deeds, or writings, to make them authentic in another country; but he principally acts in business relating to commerce; makes protests of bills of exchange which are not accepted or not paid; attests the statements of masters of ships in regard to the damage which their vessels have suffered, etc. Notaries are usually commissioned by the executive of their States, and derive their particular powers from statute provisions. In Rhode Island they are elected annually by the general assembly. In New York the statute which defines their powers in respect to foreign and inland bills, drafts, and notes, confers upon them the further authority "to exercise such other powers and duties as by the law of nations and according to commercial usage, or by the law of any other state, government, or country, may be performed by public notaries." In New Hampshire, in addition to the usual powers of the office, notaries may take depositions, and acknowledgments of deeds before them have the same validity as those made before justices of the peace. Similar provisions are found in the statutes of Connecticut and Rhode Island. In New York State women are occasionally appointed notaries by the Governor.

Notation, Arithmetical, any mode of designating number by marks or figures. Modes of arithmetical notation are more ancient than modes of representing ideas and concepts by ideographs, hieroglyphs, or alphabetic charac-

ters. Doubtless the first step toward a system of numerical notation was that of designating unity by a single stroke or score, and additional units by additional scores or strokes. The Roman system of notation plainly had its origin in this primitive method, in which all numerical quantities were noted by strokes, one for each unit. But, so to speak, the instinctive mode of counting by means of the 10 fingers (*digits*) would suggest the division of a long line of strokes into groups of 10, answering to the 10 fingers; and it is supposed that each group of 10 would be marked off by two intersecting diagonal lines forming a cross or X, thus, . The group once thus marked off, the X would become its representative abbreviation and would express 10. Similarly, half of 10, 5, would be represented by the upper half of X, which is V. And as it came to be a principle of Roman notation that a smaller number prefixed to a greater was to be subtracted from it, 4 would be represented by IV and 9 by IX: in some instances 8 and 18 would be represented by IIX and IIXX, respectively. Ten X groups were represented in Roman notation by C, or (rounded) C, the initial letter of Lat. *centum*, hundred; and as V (five) was formed of X, being half of X, so by cutting off the upper limb of C a symbol was found for 50 (L), half of *centum*. The subtractive mode of expression was usual in the notation of 40 (XL), of 90 (XC), or 400 (CD), etc.; less usual was XXC for 80. Ten hundred was represented by M, the initial letter of *mille*, thousand, and this M was commonly written (I); half of this symbol was used to designate half a thousand and was written either D or ; the sign for thousand, too, was currently written . These are all the signs used in Roman numeration—seven in all. Higher numbers, up to a million, were expressed as follows: 10,000 ; 100,000 ; 1,000,000 . The symbol for 10,000 , being cut in two, the latter half, , represented 5,000, in like manner  represented 50,000, and  500,000. With this cumbersome method of notation all arithmetical operations involved great difficulty, and hence for any but the most trifling calculations the ancient Romans had to resort to the use of the abacus (q.v.).

That, like the Romans, the primitive Greeks employed a method of notation by strokes appears from rude inscriptions on archaic monuments and on vases; but, unlike the Romans, the Greeks at an early period abandoned that clumsy mode and resorted to the alphabet for number-symbols, adopting the method of notation which was in use among the Phœnicians and the Hebrews. Neither the Phœnician nor the Hebrew alphabet had the requisite number of letters (27), and the lack (five) was supplied by five arbitrary signs. The Greek alphabet had 24 letters, and to these were added three other characters, namely, Ϟ for six, ϙ or Ϡ for 90 and Ϟ for 900. The Greek notation parallels the Hebrew, letter for letter from alpha (α), one, to omicron (ο), 70; Hebrew Phœnician and Greek agree in employing the first nine letters or symbols to designate units; the second nine to designate tens, and the third to designate hundreds. The Greek scheme is as follows:

NOTCH — NOTHOSAURUS

1	2	3	4	5	6	7	8	9
α	β	γ	δ	ε	ζ	η	θ	ι
10	20	30	40	50	60	70	80	90
κ	λ	μ	ν	ξ	ο	π	ρ	σ
100	200	300	400	500	600	700	800	900
τ	υ	φ	χ	ψ	ω			

To express thousands, the letter iota (ι) or an accent mark (') is subscribed to the numeral letters, for example, α' = 1,000, β' = 2,000, etc.; to express a number multiplied by 10,000 the capital letter M is subscribed (M standing for *myriad*, 10,000), for example, θ_M = 40,000, α_M = 8,000,000. Fractions are written with the numerator on the line and the denominator a little above, and a small space left between the integer and the fraction, thus: α θ' = 21½.

Though the Greek notation is far superior to the Roman, it makes arithmetical operations exceedingly complex. For example, in multiplying 123 (αβγ) by 321 (γβλ) these operations are necessary:

α	multiplied by	γ	=	30,000	=	γ _M
β	"	"	=	6,000	=	ζ
γ	"	"	=	900	=	θ
α	"	"	=	2,000	=	β
β	"	"	=	400	=	ν
γ	"	"	=	60	=	ξ
α	"	"	=	100	=	ρ
β	"	"	=	20	=	κ
γ	"	"	=	3	=	ι
39,483 γ _M βγ						

The Chinese system of notation was originally in principle the same as the Roman, but has been much simplified and variously improved, so that it is almost as expeditious a means of representing very large numbers as our own notation. But it is still almost or quite as cumbersome as the Roman system in the representation of numbers under 20. In it 1, 2, 3, 4 are represented by strokes, 5 by a special symbol and 6, 7, 8, 9 by that symbol followed by the requisite number of strokes: there is a symbol for 10, and from 10 to 20 the numbers are written after the same manner as those from 1 to 10. But while in the Roman system the series of tens is represented by XX, XXX, XXXX (or XL), etc., in the Chinese the successive decades are expressed by the symbol for 10 with the symbols for 2, 3, 4, etc., to the left of it as multipliers; and in like manner multipliers of hundreds, thousands, etc., are affixed.

The decimal system of notation by the nine "Arabic" numerals and the cipher appears to have been introduced into Europe through the Arabians in the 11th century; but the system had been employed centuries before in India. Though evidence exists of its use in Spain and in Italy in the 13th century by learned men, it was fully 300 years before it displaced the clumsy Roman system even in England. Though the digit-signs themselves, by their simplicity, are infinitely superior to the Roman symbols, and by their small number, ten, are far more efficient than the 27 Greek letter-numbers, the preeminent advantage of the decimal system over all other systems consists in the fact that in a line of figures, however long, the value of each, whether in units, tens, hundreds, thousands or millions, is determined by its place in the line. A figure standing alone represents never more than nine; a figure in the first place to the left of the last figure in a line represents

always its own digit value multiplied by 10; in the third place, the same multiplied by 100, and so on; each remove to the left raises the value of the figure tenfold. The use of the cipher is to keep the figures in their due places in the line; thus in 190 the cipher keeps the nine in the place of the tens; in 2,043, the cipher keeps the 2 in the place of the thousands. Before the decimal system of notation had displaced the Roman system, writers often combined the two, putting, for example, X3 for 13, or L9 for 59; or, being ignorant of the function of the cipher and of the significance of the mere position of a figure in a line they would write 503 for 52, as they would write in Roman numerals LII, or in Greek letter-numbers ρλ.

In view of the adaptability of the Arabic notation and numeration to the expression of numbers, whether integral or fractional, it is singular that the common use of decimal fractions was first proposed as late as 1585, by Simon Stevin or Stevinus, native of France, but employed in the military service of Maurice, Prince of Orange. But had it been necessary to retain his awkward method of decimal notation, the decimal system could hardly have come into general use. He expresses thus the decimals in 237.578: 237 Ⓢ 5 Ⓢ 7 Ⓢ 8 Ⓢ. Even Napier, to whom the credit is usually given of having first employed the decimal point, expresses the decimals of 1993.273 thus: 1993.273⁷, though in another place he uses this form: 1993.273. Later, Napier substituted the point (.) for the comma as sign of a decimal fraction.

Duodecimal and Sexagesimal Notations are scales of notation in which 12 and 60 respectively are the base. In duodecimal notation the local value of the symbols increases twelve-fold as they proceed from right to left. But in calculations of shillings and pence British, and of feet and inches, though part of the work is done on the duodecimal scale, the numbers themselves are expressed both in symbols and in words according to the denary scale and the decimal nomenclature. Twenty-four feet nine inches on a duodecimal scale would be 20.9, that is, two twelves without integer remainder, and nine twelfths; but we write it 24.9. The sexagesimal scale is used in the common subdivision of the hour into minutes and seconds; but as in the case of the foot and the inch, the shilling and the penny, we express the result of calculations according to the common denary scale: a complete workable sexagesimal scale would require the invention of sixty different symbols.

Notch, The. See CRAWFORD NOTCH.

Note, (1) in law and business. (See PROMISSORY NOTE.) (2) In music, a character which, by its place on the staff, represents a sound, and by its form determines the relative time or continuance of such sound. See MUSIC.

Nothosaurus, a genus of small sauropterygian reptiles, allied to the plesiosaurs, and the type of a family which includes several genera confined to the Triassic period, and prevalent as fossils in the Old World, especially in the German Muschelkalk formation. Their necks were long and terminated in an elongated skull with crocodile-like jaws; the limbs were comparatively long and slender. Consult: Tittell-Eastman, 'Text-book of Paleontology,' Vol. II. (1902).

Notker, nôt'kér, two Swiss monks of the monastery of Saint Gall. **SAINT NOTKER BALBULUS** (the Stammerer): b. Thurgau about 840; d. St. Gall 6 April 912; is best known for his adoption of the simple Roman or Gregorian chant, and for his words for many sequences, the most famous being 'Media vita in morte sumus.' He was canonized 1513. **NOTKER LABEO** (Thick Lipped; sometimes called "Teutonicus," the German): b. about 950; d. 1022; founded a great school of translators, who, working under his name translated into German Boethius, the Psalter, etc., and thus left important documents for the study of Old High German in the 10th and the 11th centuries. The versions of Labeo and his school are edited by Piper (1883-4). Consult Kelle, 'Die Sankt Gallen deutschen Schriften und Notker Labeo' (1888).

Noto, Sicily, a city and episcopal see, three miles from the Mediterranean, and 27 miles by rail southwest of Syracuse. Its chief buildings are a fine cathedral and town hall. It has manufactures of olive oil, vegetable fibre, wine, and macaroni, and quarries of limestone. Noto dates from 1703 when it replaced the ancient Nictum overthrown in 1693 by an earthquake.

No'tochord, or **Chorda Dorsalis**, a rod of gelatinous tissue forming the main skeletal axis in the young of all Chordata (q.v.) and in some persisting as the only support of the body throughout life. It arises in development from the mid-dorsal line of the entoderm (see **EMBRIOLOGY**), becomes cut off from this parent layer and comes to lie as a continuous unsegmented structure between the digestive tract and the central nervous system. Around it is formed an envelope, the notochordal sheath, and in the vertebrates the bodies or centra of the vertebrae arise. In the lower vertebrates parts of the notochord persist throughout life (for example, filling the cavities in the ends of the vertebrae in fishes), but in the higher forms the notochord is almost entirely replaced by bone and the intervertebral ligaments, the sole remnants of this structure in man being the so-called *nucleus pulposus* of these ligaments. See **AMPHIBIOUS**; **ASCIDIAN**.

Notonot'idæ. See **FRESH-WATER INSECTS**.

Notornis, a genus of gigantic rail-like birds of the South Island of New Zealand without the power of flight. The genus was first known by fossil remains named *Notornis mantelli*. Subsequently living examples were found; but it is supposed that none now exist. Norfolk Island formerly had another species, pure white, but it was exterminated by early white visitors to the island. Consult Newton, 'Dictionary of Birds' (1896).

Nototherium, a genus of fossil marsupials found in Upper Pliocene deposits in Greenland and South Australia, allied to *Diprotodon* (q.v.) but smaller.

Notre Dame, nô'tr dâm, University of, a Roman Catholic institution in charge of the Fathers of the Holy Cross, at Notre Dame, Ind. It was founded in 1842 and chartered two years later. It has 13 full collegiate courses besides courses in art and music. The courses lead to the degrees of A.B., B.S., Ph.D., and B.L. The equipments for all laboratory and applied science

work are exceptionally good; the science building and furnishings are valued at \$500,000. The departments of natural science received great assistance in their foundation work from the personal attention of the scientist, Very Rev. J. A. Zahm (q.v.). The frescoes, and a number of the oil paintings are by Gregori, and are of remarkable beauty and power. To encourage good works along spiritual and intellectual lines, the University presents each year a medal called the 'Lectare Medal' to some Roman Catholic layman or woman who has done some special good work for the benefit of humanity. Two regular publications are issued from the University, but one, 'Ave Maria,' is not a distinctively university periodical. Affiliated with the university are several schools for the brothers, novices and young priests of the Congregation of the Holy Cross, and on the grounds is the Provincial House of the Order for the United States. The university has also several preparatory schools in different parts of the United States. In 1910 there were connected with the university 91 professors and instructors; 1,000 students, 450 of whom were in the preparatory department. The library contained 65,000 volumes, valued at \$65,000; the scientific apparatus, machinery, and furniture was valued at \$205,000; and the grounds and buildings at \$2,010,000.

Notre Dame de Paris, dé pâ-ré'. See **PARIS**.

Notre-Dame de Paris, a romance in prose by Victor Hugo, published in 1831. The scene is placed in Paris at the close of the reign of Louis XI. The cathedral seems to fill the author's vision and dominate his mind from beginning to end. Among his different conceptions of Notre-Dame he brings out most clearly of all the truth that the cathedral of the Middle Ages was the book of the people; and that since the dawn of printing, books have taken the place of those marvelously involved and inexhaustible carvings, where the smoldering passions of the multitude, their humor and irreligion as well as their religion and poetic emotion, found continual expression. To the reader who loses himself in the atmosphere thus created, the world is France, France is Paris, Paris is the cathedral. He is taken through the aisles and galleries, out on the roof, up in the towers, then faithfully, scrupulously through the squares or cross-roads of the old city, along crooked streets that have vanished, and thoroughfares still existing, like Rue Saint-Jacques or Rue Saint-Denis, which it calls the arteries of Paris. Thus it may be taken as a 15th century guide-book of the town, answering all the purposes of a Baedeker; not only giving the general topography, but touching on nearly every structure then standing. Like Walter Scott's 'Quentin Durward,' and Théodore de Banville's play 'Gringoire,' 'Notre-Dame' contains a searching study of the treacherous but able monarch, Louis XI.

Nott, nôt, Charles Cooper, American jurist: b. Schenectady, N. Y., 16 Sept. 1827. He is a grandson of Dr. Eliphalet Nott (q.v.) and of Dr. Charles D. Cooper. He was graduated from Union College in 1848, studied law at Albany, N. Y., and began the practice of his profession in New York in 1851. Through his means, in February 1860, Abraham Lincoln came to New York to deliver the 'Cooper Institute Address,' which resulted in Lincoln's nomination for the Presi-

NOTT—NOURMAHAL

dency. During the Civil War he served as captain in the 5th Iowa cavalry, and colonel of the 176th New York volunteers. Taken captive at Brashear, La., in June 1863, he was held prisoner in Texas until July 1864. In February 1865 he was appointed judge of the court of claims, and in November 1896 was appointed chief justice of the court by President Cleveland. He has published: 'Mechanics' Lien Laws' (1856); 'Sketches of the War' (1863; in German 1883); 'Sketches of Prison Camps' (1865; in German 1884); and has edited and compiled 'The Seven Great Hymns of the Mediæval Church' (1866, 8th ed. 1902), and the 'Court of Claims Reports' (38 vols. 1867-1903).

Nott, Eliphalet, American clergyman and educator: b. Ashford, Conn., 25 June 1773; d. Schenectady, N. Y., 20 Jan. 1866. He was graduated from Brown University in 1795 and entered the Presbyterian ministry the same year. After holding pastorates in Cherry Valley and Albany, N. Y., he became president of Union College in 1804, where he remained till his death. He published: 'Counsels to Young Men' (1810); 'Lectures on Temperance' (1847). His funeral sermon on the death of Alexander Hamilton was widely famous. By his inventions of stoves and other warming apparatus he acquired a fortune, much of which he devoted to the assistance of Union College.

Nott, Josiah Clark, American ethnologist and physician: b. Columbia, S. C., 24 March 1804; d. Mobile, Ala., 31 March 1873. In 1824 he was graduated at the South Carolina College and from the medical school of the University of Pennsylvania in 1827. After further study abroad he established himself in Mobile, and in 1858 founded a medical school there. During the Civil War he was for a time on the staff of the Confederate General Bragg. With G. R. Glidden (q.v.) he wrote 'Types of Mankind' (1850), and 'Indigenous Races of the Earth' (1857), the purpose of which was to oppose the theory of the unity of mankind. He was sole author of 'The Connection Between the Biblical and Physical History of Man' (1849); 'The Physical History of the Jewish Race' (1850).

Nottebohm, nôt'té-bôm, Gustav, German composer: b. Lüdenscheid, Westphalia, Prussia, 12 Nov. 1817; d. Grätz, Germany, 1 Nov. 1882. He served in the German army at Berlin in 1838-9, but continued his musical studies, and there formed a friendship with Schumann and Mendelssohn, through the influence of the latter obtaining his discharge from the army and becoming a composer of note. Among his works are: 'Ein Skizzenbuch von Beethoven' (1865); 'Mozartiana' (1880); etc.

Nottingham, nôt'ing-am, Hansage Finch, 1st EARL OF, English statesman: b. Kent, England, 23 Dec. 1621; d. London 18 Dec. 1682. He was educated at Oxford, studied law and was admitted to the bar of the Inner Temple in 1645. At the Restoration his reputation as a lawyer raised him to the post of solicitor-general; in 1661 he was elected member to Parliament for the University of Oxford, and was made a baronet, in 1670 became attorney-general, and in 1673 lord-keeper. He was made high chancellor in December 1674. In the same year he was made Baron Finch, and in 1681 became

earl of Nottingham. His powers as an orator were highly rated; and Dryden has given to posterity his portrait in 'Absalom and Achitophel,' under the character of Amri. Several of his speeches on the trials of the judges of Charles I. have been published, as have also some of his parliamentary orations.

Nottingham, England, a city and civic county, capital of Nottinghamshire; on the Leen, near its junction with the Trent, 110 miles northwest of London. It occupies a picturesque site overlooking the Vale of Trent. The castle, which crowns the summit of a rock, rising 133 feet above the level of the Leen, was originally built by William the Conqueror as a means of overawing the outlaws frequenting the recesses of Sherwood Forest. Dismantled during the Protectorate, it subsequently became the property of the Duke of Newcastle, who in 1674 erected a large mansion on part of the site. This, after being partly burned in riots connected with the reform movement in 1831, now contains the Midland Counties Art Museum, free library, etc. The principal educational and literary institutions are the University College and Technical School, high school for boys, the Blue-Coat School, the School of Art, the People's Hall, and the Mechanics' Institute. An arboretum covering 18 acres is a feature of the town. The staple manufactures are cycles, hosiery, and lace, the latter being a specialty. There are also manufactures of cotton, woolen and silk goods, and of articles in malleable and cast iron. Nottingham was a place of importance in Anglo-Saxon times, and was twice or thrice taken by the Danes. Charles I. raised his standard here in 1642, and next year the town and castle were taken by the Parliamentarians. Serious riots, occasioned by the introduction of machinery, took place in 1811-12 and 1816-17. Pop. about 250,000.

Nottoway (nôt'ô-wâ) Indiana, an American tribe of the Algonquin family, formerly residing along the Nottoway River, in Virginia. They were very similar to the Tuscaroras of North Carolina. In 1785 about 400 survivors of the tribe occupied a reservation of 27,000 acres.

No'tus, the south wind or southwest wind.

Noue, François de la, frân-swî dé lâ noo, French Huguenot captain: b. near Nantes 1531; d. Montcontour 4 Aug. 1591. He was a member of an o'd Breton family, fought in Piedmont under Brissac, became a Protestant in 1557, and was one of Coligny's bravest lieutenants. In 1570, at the siege of Fontenay-le-Comte, he was wounded in the left arm, and after its amputation wore an iron mechanism to hold the bridle, thus winning the nickname of 'Bras de Fer,' or 'Iron Arm.' He fought in Flanders with great success from 1578 to 1580, when he was captured by the Spanish. His five years of captivity were occupied with the composition of his 26 'Discours politiques et militaires' (1587). He fought under Henry of Navarre at Senlis, Arques, Ivry, and Lamballe, and was mortally wounded in the last fight. Consult the biography by Hauser (1892).

Nourmahal, noor-ma-hâl, 'LIGHT OF THE HAREM,' the heroine of Thomas Moore's poem, 'The Light of the Harem,' in 'Lalla Rookh.' Her quarrel and reconciliation with the caliph

NOUVELLE FRANCE—NOVA SCOTIA

Harun al-Rashid form the theme of the story; afterward she is known as Nourjehan—"Light of the World."

Nouvelle France, *nou-vél frâns*, or **New France**, the original name given to Canada (q.v.) by the early French settlers.

Nova Cms'area, the Latin name for New Jersey.

Nova Constella'tio Coinage, two silver coins proposed by Robert Morris in 1783 for national coinage, but not accepted by the Continental Congress. They were called the Mark and the Quint. See NUMISMATICS.

Nova Scotia, *nô-vâ skô'shî-â*, one of the three maritime provinces of the Dominion of Canada, comprises a long, narrow peninsula, on the eastern coast of North America, lying northeast and southwest, and the island of Cape Breton, separated from the peninsula on the northeast by the gut of Canso, 16 miles long and from $\frac{1}{2}$ mile to 2 miles wide, and Chedabucto Bay. The dangerous Sable Island, surrounded by a sand bank on which many ships have been wrecked, is a dependency of Nova Scotia, from which it is distant about 90 miles in lat. $43^{\circ} 59'$ N. at its eastern end, lon. $59^{\circ} 45'$ W. The whole province, including Cape Breton, lies between lat. $43^{\circ} 25'$ and 47° N. and lon. $59^{\circ} 40'$ and $66^{\circ} 10'$ W. The greatest length of the peninsula is about 280 miles and its greatest width from 50 to 100 miles. It is bounded north by the Straits of Northumberland and the Gulf of Saint Lawrence, south and southeast by the Atlantic Ocean, and northwest by the Bay of Fundy. The island of Cape Breton, whose extreme length is 100 miles, extreme width 85 miles, is almost equally divided by an inland sea, the Bras D'Or Lake. The peninsula has an area of 12,360 square miles, and Cape Breton 3,120 square miles. Sable Island is 25 miles long and $1\frac{1}{4}$ wide, and consists of sand hills thrown up by the sea, on which grasses grow which maintain many wild horses known as Sable Island ponies.

Topography.—The surface of Nova Scotia proper is undulating, and the scenery varied but not grand. Three ranges of highlands, with a general direction of from southwest to northeast, their general features clearly showing them to belong to the Appalachian Range, diversify the surface. These, roughly, are the range extending along the Atlantic coast from Cape Sable to Cape Canso, which are chiefly of Lower Cambrian formation, except for a belt of intrusive granite that stretches from Cape Sable to Chebucto Head, near Halifax; the Cobequid Mountains, which rise to a height of about 1,050 feet and extend from the Bay of Fundy on the north or isthmian side of the province, through the counties of Colchester and Cumberland to the vicinity of Pictou; and a detached, narrow ridge of trap, known as the North Mountain, about 700 feet high, which extends along the Bay of Fundy, from Digby County to the steep headland of Blomidon, in Kings County, near the entrance of Cobequid Bay. The rock formation of Cape Breton is similar to that of Nova Scotia proper, but is more irregularly distributed. The chief features of the surface of Nova Scotia were left marked as at present by the great earth storm of the later

Devonian period. The fertile valleys between the three ranges of hills are respectively of Upper Silurian, Devonian, and Carboniferous origin. The northwest side of the peninsula is deeply indented by large arms of the sea, separated by steep promontories. The Atlantic side is penetrated everywhere by inlets of greater or less size, the most important of which are Chedabucto Bay, Halifax Harbor, and Chester Basin. The north shore, on the Gulf of Saint Lawrence, is comparatively smooth and uniform in its coast line, and this is true also of the eastern coast of Cape Breton, while the other sides of this island are very irregular. The peninsula has about 400 lakes, of which Rossignol in Queen's County is the largest. The Bras D'Or Lake in Cape Breton covers an area of 500 square miles, or about one sixth of the entire area of the island. The climate of Nova Scotia, tempered as it is by the Gulf Stream, which flows very near its southwesterly end, is comparatively mild, and especially in the sheltered Cornwallis and Annapolis valleys is favorable to comfort and health. The average temperature is 65° F. in summer, 25° F. in winter. The average rainfall for 27 years (1874-1900) was 38.1, average snowfall for the same period 75.4, total precipitation 45.6. On account of its freedom from extreme heat Nova Scotia has lately become a popular summer resort for United States people of the eastern and middle States. The province contains many rivers, but few of them are over 50 miles in length. In the valleys the soil is of great richness, and Nova Scotia is noted for its vast tracts of inexhaustibly fertile dyked marsh land, in earlier or later times by patient industry reclaimed from the sea. This marsh land lines the head waters of the Bay of Fundy and spreads far inland up the valleys of its river tributaries. In general, alluvial deposits are formed in river basins by materials washed down from higher levels by fresh-water floods; here the whole deposit is of tidal origin, the result of a landward rather than a seaward transportation. Every incoming tide is freighted with a finely comminuted sediment, the product of the wearing action of the currents upon the sides and bottom of the bay. The elements of this sediment are trap and new red sandstone, the latter being the greater element. Its detritus consists of a large percentage of silica, a little clay, the iron which mainly determines the reddish color of the deposit, and the calcareous matter which served as cement in the parent rock. The great fertility of this alluvium may be seen in the fact that the Annapolis, Cornwallis, Grand Pré, and Cumberland marshes have been producing annually for over two centuries from two to four tons per acre of the finest hay. After the hay has been removed the dikes are converted into autumn pastures for cattle, who fatten more rapidly on their luxuriant after-growth than on any other kind of food. The reclaiming of these dikes from the daily tides, which if permitted to rush in will destroy the grass for a year, was begun by the Acadian French and energetically pursued by their successors, the New England people who came in 1760-1. The flora of Nova Scotia is much the same as in other sections of Canada south of the Saint Lawrence. The woods are maple, elm, walnut, oak, tamar-

NOVA SCOTIA

rack, spruce, pine, and other woods, hard and soft.

Agriculture.—The most important industries of the province are agriculture and fruit growing, fishing, mining, and lumbering. Of late, however, a good deal of activity has been shown in manufacturing of various kinds. Nova Scotia has an area above tide level of 13,483,671 acres, of which 5,080,901 are occupied. Of this, 34,240 acres are covered by orchards of apples, pears, plums, and cherries, 554,371 acres are hay land, 16,334 are in wheat, 37,459 in potatoes, and 91,087 in oats. In the last 20 years the fruit industry has greatly increased, cold storage making possible large shipments, especially of apples, to the British market. The total yield of apples in 1891 was 1,051,592 bushels; of plums, 9,246 bushels; of peaches, 534 bushels. In 1901 the yield was, apples 2,065,104 bushels; plums, 28,931 bushels; peaches, 3,231 bushels. The total value for 1902-3 of agricultural products, including fruit was \$853,106, of apples alone \$188,910, of animals and dairy products \$711,207, of woods exported \$1,048,160.

Fisheries.—The fisheries have always been active, salmon, cod, shad, mackerel, lobsters, and other fish abounding off the shores and in the rivers. The value of the total catch in 1901 was \$2,112,022, an increase of \$300,288, or nearly 23 per cent, over the value of 1899. The number of men employed in fishing vessels and boats in 1900 was 25,212, of persons employed in lobster canning factories, 6,447. The value of all fisheries for the fiscal year ending June 1903 was \$8,000,000, and the number of men employed 29,529. Fishing receives from the Dominion government a subsidy outside of bounties of about \$400,000 a year. In many parts of the province game is plentiful, bears, foxes, deer, and smaller animals being found in considerable numbers.

Minerals.—Nova Scotia is remarkably rich in minerals, the coal fields being almost inexhaustible, and gold, lead, copper, manganese, gypsum, and barytes being found in abundance. For the year ending 30 Sept. 1901 the sales of coal aggregated \$3,119,335, the Province of Quebec being the largest consumer. The province has 11 coal mines, 5 of which are in the peninsula and 6 in Cape Breton island. In 1902-3 these mines employed 8,062 persons. There are more than 20 districts where gold is mined, the most important mine being at Sherbrooke in Halifax County. Between 1900 and 1901 the number of tons of ore crushed was 1,358,864, and the value of the gold extracted about \$14,274,054. The value of the gypsum yield in the same year was \$119,278. The mine royalties in 1902-3 reached the large figure of \$487,948.90.

Manufactures.—In 1902-3 the value of manufactured products exported from Halifax reached the sum of \$766,164. Among the chief manufactures are agricultural implements, biscuits and breads, coke, drugs, and chemicals, extract of hemlock bark, fertilizers, furniture, iron and steel, leather, and wood pulp. The canning of fruits, milk, and meat is receiving much attention. In Cape Breton and the western part of the peninsula considerable leases of crown lands have lately been made for the development of the wood pulp industry. In various places, owing to the abundance of hemlock bark, tanning is actively carried on, and

some attention has long been given to sugar refining and rope and twine making.

Finances.—The revenues of the province come chiefly from a Dominion subsidy of about \$433,000 annually, from mine royalties, which exceed this sum, from the lease of crown lands, which in 1901-2 amounted to \$74,735; and from succession duties and other miscellaneous sources. The total revenue from all these sources in 1902-3 was \$1,140,216. The expenditures were less than the revenue by about \$53,000. At the close of the fiscal year ending 30 Sept. 1902 the debt of the province was \$3,766,300. Nova Scotia supports a school for the deaf and dumb and one for the blind, an insane and a general hospital, and 24 poor-houses. Criminals are sent to the provincial penitentiary at Dorchester, N. B. The public charities in 1902-3 cost the province \$40,573.

Transportation.—In 1901 the province had in operation 943 miles of railway; since then this has been increased to 1,055. There are now under construction 182 miles more. Telegraph and telephone lines run everywhere and the province has two cable stations, one at Canso and one at Sydney. At the close of 1901 Nova Scotia had in registration 1,080 vessels with a tonnage of 214,560. In that year she had registered 133 vessels with a tonnage of 14,660. The total number of ships arriving from foreign ports during the fiscal year ending 30 June 1901 was 3,103; tonnage 419,031. This registration includes the ships arriving at 85 ports. Of these Halifax heads the list, with 1,185 vessels and 899,079 tons, Sydney coming next with 361 vessels and 541,455 tons. Halifax is the third port in Canada, Victoria, B. C., being first and Montreal second.

Banks.—The banks in operation with their branches are: The Union of Halifax, Royal of Canada, Bank of Nova Scotia, Bank of British North America, and Commercial of Windsor. The clearing house transactions in 1900 amounted to \$77,000,000.

Population.—The population is greater than that of any province of the Dominion except Ontario and Quebec. Ontario has over 2,000,000 inhabitants, Quebec over 1,500,000, and Nova Scotia, 459,574. Of this number 162,141 are reckoned as of English descent, 142,207 as Scotch, 55,830 as Irish, 45,067 as French, and 38,854 as German. The increase in population between 1891 and 1901 was 8,800. Halifax, the capital, has a population of 40,787; in 1891 it was 38,495. The next town in size is Sydney, the seat of the recently established steel industry in Cape Breton. In 1901 this town had a population of 9,908. In 1891 it had only 2,427. The number of incorporated towns in all is 28; of these the largest are Glace Bay, Yarmouth, Truro, Springhill, Amherst, New Glasgow, Windsor, and Pictou.

Government.—Since confederation the province has been represented at Ottawa by 10 senators, and 20 members of the lower house. It has its own local legislature, meeting at Halifax, and a lieutenant-governor appointed by the governor-general and his council. The local legislature consists of a council of 21 members and a legislative assembly of 38. The executive consists of three ministers with salaries and six without portfolios. The house of assembly is elected by the counties, the municipal units of government being counties and

NOVA SCOTIA

towns. In each of the 18 counties the people elect a county council, which in turn appoints the other county officers. It is necessary to secure the sanction of the people in order to borrow money, and the lieutenant-governor has a right of veto upon the money-borrowing powers as well as the by-laws passed by the council.

Education.—Nova Scotia has an admirable free school system, which was introduced in 1865, but there are no separate schools as in Ontario and Quebec, under denominational control, receiving government support. In each of the 18 counties of the province there is a county academy, the highest grade of the public schools, the curriculum of which contemplates the fitting of pupils for college. In Truro there is a normal school, in which 1,044 teachers serving in 1901-2 were trained for their work. The whole number of teachers in that year was 2,492, and the number of pupils enrolled was 99,059. The schools are supported by local taxation and by subsidy, about two fifths of the necessary cost being met by government grant and municipal aid. The total expenditure per pupil in 1900-1 was \$15.75. Education is controlled by a Council of Public Instruction, of which the Superintendent of Education is the head. The council is composed of the members of the Executive Council. The province has besides the schools already mentioned a school of agriculture, a school of mechanical and domestic science, several manual training schools, a school of art and design, a summer school of science, and five chartered colleges, and one divinity college having the power to confer degrees. The colleges are Kings at Windsor, Dalhousie at Halifax, Acadia at Wolfville, Saint Francis Xavier at Antigonish, and St. Anne's at College Point in Digby County. The divinity college is controlled by the Presbyterians and is at Halifax. The only college that is undenominational is Dalhousie at Halifax. In all these colleges together there are not more than 700 students. In Halifax, Windsor, Wolfville, Horton, and Annapolis there are private schools for boys and girls.

Religion.—The chief religious denominations are the Roman Catholic Church with 129,578 adherents, Presbyterian, 106,319, Baptist, 74,078, Anglican, 66,067, Methodist, 57,490, Free Will Baptist, 8,355, Lutheran, 6,572, Congregational, 2,938. No part of the population is without church attachment.

Distinguished Citizens.—Nova Scotia has reared many distinguished men, chiefly officers of the army and navy. Such are General William Cochran, Sir John E. W. Inglis, hero of Lucknow, Admiral Sir Provo W. P. Wallis, and Sir Fenwick Williams, hero of Kars. The humorist, Judge T. C. Haliburton ("Sam Slick"), was a Nova Scotian, as are also his son, Lord Arthur Haliburton, and Sir Charles Tupper, Bart., the well known statesman. Among the writers of the province have been Thos. B. Akins, Sir John G. Bontinot, John B. Calkin, Arthur W. Eaton, George M. Grant, Sir J. W. Dawson, George W. Hill, Joseph Howe, Mrs. M. J. Lawson, Arthur Lockhart, Beamish Murdoch, J. Macdonald Oxley, Benjamin Rand, Silas T. Rand, Theodore H. Rand, E. M. Saunders, Marshall Saunders, and T. Watson Smith.

History.—The Nova Scotian peninsula was the most important part of the ancient Acadia, and its little town Annapolis Royal, in French times

called Port Royal, while the province remained in the hands of France was the chief Acadian seat of authority and centre of influence. The name Acadia or Acadie is first found in the petition of De Monts to the French king for leave to colonize this portion of the new world. The province of New Brunswick was included in Acadia, but not the island of Cape Breton. Nova Scotia's authentic history begins with the landing at Port Royal in the spring of 1604 of Sieur de Monts, a gentleman of the bedchamber of Henry IV. of France, who had previously accompanied Chauvin and Pontgrave to the Saint Lawrence. There is a French tradition that a little settlement was made in Cape Breton as early as 1541, but Port Royal was the first settlement ever attempted on any part of the peninsula. De Monts held a commission as lieutenant-general of Acadia with full powers to cultivate and hold the land, to discover mines, and to convert the Indians. In his first expedition another nobleman, Baron Poutrincourt, accompanied him. Owing to the failure of the French trading company in 1607, the colony they founded at Port Royal was suspended for nearly three years. In 1610, however, Poutrincourt again came to Port Royal and from that time the town has had a continuous history. When Poutrincourt came the second time he took possession of the houses his people had built in 1604, and it may therefore be said that Port Royal is the oldest town in all North America, except Saint Augustine in Florida, which was founded by Spaniards in 1565. Jamestown, Va., was founded by the English in 1607, and Quebec by Champlain in 1608. Shortly after 1610 other explorers came to Port Royal, in their wake coming first Jesuit, then Recollect priests, who soon converted all the native Micmacs (an Algonquin tribe) to the Roman Catholic faith. In 1613 Argal (afterward deputy governor of Virginia) destroyed the fort at Port Royal. In 1621 Acadia was granted to Sir William Alexander, who named it Nova Scotia and helped James I. establish the order of Barons of Nova Scotia. In 1628 Sir David Kirk captured Port Royal for England, but in 1632 the province was restored to France. In 1654 Acadia was surrendered to English troops sent on by Cromwell, but in 1667, by the treaty of Breda was restored to France. In 1710 Col. Francis Nicholson finally conquered Port Royal for England, and in 1713 the treaty of Utrecht confirmed Nicholson's conquest. In 1749 Col. Edward Cornwallis brought out an English colony and founded the town of Halifax, immediately afterward establishing a civil government there in place of the military government at Annapolis. In 1755 because of their persistent refusal to take the oath of allegiance, the Acadian French were removed, and in 1760-1 their lands were occupied by 6,000 or 7,000 New England planters, who founded many of the best known families of the province. In 1758 a constitution, with an elective assembly, was granted Nova Scotia, in 1763 Cape Breton and Prince Edward Island were annexed to Nova Scotia, but in 1770 Prince Edward Island was separated. In 1773 began the large Scottish emigration which has given certain counties of Nova Scotia the chief part of their population. In 1776 and 1783 from 30,000 to 35,000 Loyalists, chiefly from New England and New York, poured into the province.

NOVA ZEMBLA—NOVEL

the New York Loyalists founding the town of Shelburne and creating in Nova Scotia the first colonial see of the English Church. In 1754 New Brunswick and Cape Breton were both separated from Nova Scotia, but in 1820 the latter was re-annexed. In 1848 responsible government was introduced and in 1867 Nova Scotia became a province of the Dominion of Canada. In its history as an English province Nova Scotia has had to the present 32 governors (since Confederation they have been, of course, lieutenant-governors), many of them more or less famous military men. Before the appointment of Lord Dorchester as governor-general of Quebec, Nova Scotia, and New Brunswick in 1786, she had also 11 lieutenant-governors, of whom Gen. Edmund Fanning, a Loyalist, was the last.

ARTHUR WENTWORTH EATON, *Author of 'The Church of England in Nova Scotia.'*

Nova Zembla, *nō'va zēm'bla* (Russian, *Novaya Zemlia*), two islands in the Arctic Ocean, belonging to Russia, and forming a dependency of the government of Archangel; lat. 70° 30' to 77° N.; lon. 52° to 69° E. They are separated by the narrow Matotchkin Shar Strait, and from the Isle of Vaigatz on the south and from the mainland on the east by the Sea of Kara. Their greatest length, northeast to southwest, is about 740 miles; breadth, about 80 miles. The greater part of the interior is unexplored. The general slope of both islands appears to be toward Matotchkin Strait, on which the mouths of at least 15 small streams have been counted. Lakes also are numerous. The whole territory is wild and desolate. The coasts swarm with seals, various kinds of fish, and vast flights of water-fowl. The interior, which is partly covered with stunted shrubs, short grass, and moss, is frequented by reindeer, white bears, ermines, and Arctic foxes. In 1596 Nova Zembla was reached by Barentz who wintered there. It was circumnavigated by Johannesen in 1869 and 1870, and the Kara Sea found comparatively free of ice. It was again circumnavigated by Captain Carlsen in 1871, and partially explored by Lieutenants Weyprecht and Paver in the same year, and again in 1872-4. Other explorations have been made since, and two or three settlements of Samoyedes have been established. Pop. about 100.

Novella, *nō-vā'lis*. See HARDENBERG, FRIEDRICH VON.

Novara, Italy, (1) a town, capital of the province of Novara, situated between the Agogna

and Terdoppia, 51 miles northeast of Turin. It has an ancient and magnificent cathedral with a lofty tower, an episcopal palace, two colleges, a ruinous old castle, and a remarkably fine market-house. The manufactures include sweet biscuits, which have a large sale. The rice and grain markets are the most important in Piedmont. Pop. about 50,000. Novara is famous for the battle fought there on 23 March 1849, between the Sardinians and Austrians, in which the former were completely defeated, and Charles Albert, in consequence, abdicated in favor of his son Victor Emmanuel. (2) The province consists generally of a large and fertile plain, watered by the Po and several of its tributaries, and well adapted for the growth of rice. Pop. about 750,000.

Novatianism, *nō-vā'shī-an-iz'm*, the doctrine of Novatianus, a priest of the Church at Rome in the 3d century. Novatian had been a Stoic philosopher and carried out the stern, harsh views of that sect in his ministry as a Christian teacher. The schism called after him originated as follows: After the Decian persecution, a controversy arose about the manner of dealing with those who apostatized before the threat of torture or death (*lapsi*). Novatian at first inclined to advocate their absolution after due penance, but when Cornelius, the Roman bishop, followed this course, Novatian opposed his authority, and was chosen and ordained bishop by three country bishops in opposition to Cornelius, and thus became the first anti-pope. He was condemned in councils at Rome and Carthage. The party who shared his views were called Novatians. They held that, in the case of idolatry through fear of persecution, the Church could not absolve the penitent; and this doctrine they extended, at a later period, to all grievous sins. They claimed for themselves a character of especial purity, and assumed the name Puritans (*Cathari*). Their views continued to be taught in Italy and Africa up to the 6th century. See CYPRIAN.

Novel, *Thē*. The word novel (derived from the Latin adjective *novella*, feminine of *novellus*, Italian and Spanish *novella*, French, *novelle*) signifies literally, when applied to fiction, a new tale, new story, or new anecdote—that is, one never told before, or at least one never heard before by the listener. Since the early period of the renaissance, the word, in its slightly variant forms, has been employed in most of the literatures of western Europe, except English, to denote a short fictitious narrative dealing mainly with the incidents and intrigues of ordinary life, and written usually, though not invariably, in prose. This was also the English usage in the 16th century when collections of Italian *novelle* were first translated into English, either directly or through the French. But during the next century, the short tale of the Italian type underwent in English large expansion; and the word *novel*, naturally enough, was still retained as the name of the longer narrative, which by the time of Richardson had assumed, to a degree, the structure of the drama and the amplitude of the epic. *Clarissa Harlowe*, eight volumes in the whole, was called a novel. For a certain class of fictions we have also had since the time of Chaucer and before him the term

NOVEL

romance, which (derived from the Latin adjective *romanicus*, through the adverb *romance*, "in the Roman fashion") meant at the outset anything composed in the *lingua romana*, that is, in the vulgar Latin tongue, like Provencal, French, or Italian. As the early productions in the languages that sprang from the Latin were, in large measure, verse-narratives of love and adventure, the word romance became the general term for them. When at a later period, on the invention of printing and thereabout, these verse-tales were reduced to prose, it was natural that the old word should cling to them. Wherefore it is that *roman* in French and German (*romanzo* in Italian) is to this day the most general term for a prose-fiction, while *novelle* or *novella* is reserved, in the Italian way, for a short story. In English (and also in Spanish) the case is just the opposite. With us, a prose-fiction, whatever its length, which deals realistically with actual life is called, in criticism and conversation, preëminently a novel. A prose-fiction which deals with life in a fantastic manner, or represents it in the setting of strange, improbable, or impossible adventures, or idealizes the virtues and the vices of human nature, is called a romance. 'Tess of the D'Urbervilles' is a novel. The 'House of the Seven Gables' is a romance. Likewise 'Henry Esmond' is an historical novel, while 'Ivanhoe' is an historical romance.

These distinctions, historical in origin, it will be well to bear in mind. But for the broad treatment of the theme now in hand, the novel must be made to include many fictions in prose and some in verse that do not fall strictly within the meaning of the term. Novels may be divided into two classes. There is, said Stevenson, the novel of incident and the novel of character. In the novel of character, the interest is directed to the portrayal of men and women; and the tale, the story, or the yarn is a subordinate consideration. This type of fiction has no date earlier than 'Don Quixote'; it was made a fashion by Richardson and Fielding. In the novel of incident, the interest is directed to what happens; characters, if there be any at all, come only by the way, the tale, the story, or the yarn is the main thing. As folk-tales, this type of fiction belongs to all races and peoples in a primitive state of civilization. As a cultivated literary form, it commonly follows the break-up of the primitive epic. After 'Beowulf', the 'Nibelungenlied' and the 'Chanson de Roland' come, for example, the romance of King Arthur and the Knights of the Round Table. [Consult Ker 'Epic and Romance' (London and New York, 1897).]

The Orient—For centuries before the invention of printing, the professional story-teller was everywhere a most important figure—in the east as well as in the west—and he still retains much of his ancient prestige among all peoples where the habit of reading has not become generally diffused. If he appears first in Egypt, it is simply because the records of Egyptian civilization are the most ancient of all. Just as at later times in the west, tales centered around Charlemagne or Richard the Lionhearted, so it was in Egypt. Among the debris of a most ancient cycle, are three short stories known as the 'Tales of the Magicians.' On a day in the third millennium before Christ,

Cheops, the builder of the great pyramid, suffering from ennui, called his three sons into his presence that they might entertain him with the wonders wrought by famous magicians. One tells of a crocodile which a magician made of wax and threw into the river, where it seized and carried away the lover of the magician's faithless wife, as he was out for an evening bath. This story is, so far as content goes, very like a mediæval *fabliau* or *novella*. Another relates that when King Sneferu was one day out on the lake of his palace with the maidens of his court, one of them lost a jewel from her hair, which was recovered by a magician who parted the waves and laid bare the bed of the lake. It is an exceedingly pretty tale. The last son tells of a magician who neatly restored the heads of animals after first cutting them off. Throughout these stories, the most ancient of the world, appears frequently "the chief reciter," who was a sort of master of the revels. In the story-telling of succeeding dynasties, magic gave way more and more to adventure, and the description of manners, especially among the peasantry. 'The Shipwrecked Sailor' (XIIth dynasty) is the Egyptian 'Robinson Crusoe.' 'The Doomed Prince' (XVIIIth dynasty) is a tale of romantic love. The prince, as in many, since popular romance, obtains the princess for his wife by climbing up to the window of her palace supposed to be inaccessible. And 'Anpu and Bata' (XIXth dynasty), the first part of which runs on the motif of Joseph and Potiphar's wife, has a beautiful pastoral setting. What one misses in Egyptian, as in all other ancient fiction, is the portrayal of character, except on the simplest lines.

In India the beast-fable, the fairy tale, the adventure, and the love-intrigue have been current from the earliest times. Stories of these several types were, in the old time, usually fitted into the frame work of a single narrative after a very elaborate plan. Bearing most closely upon the fiction of the west is the 'Panchatantra,' a book of fables in which the ways and conduct of men—their friendship, disputes, craft, jealousies, and virtues and vices in general—are frankly transferred to the lower animals, the bull, the lion, the crow, the owl, etc. These stories, always didactic in aim, abound in humour, irony, and satire. Translated from the Sanskrit into the literary language of Persia in the sixth century of our era, the book passed thence into Arabic about 790 A. D., under the name of the 'Fables of Bidpai'; and finally through the Latin into the modern literatures of western Europe. More remote from our subject are the 'Vetāla'—*panchavin-cati*, a group of 25 fairy tales, well known in English under the title of 'Vikram and the Vampire'; and the 'Katha-sarit-sāgara,' or 'Ocean of Rivers of Stories,' an immense collection of verse-tales of various kinds, composed by Somadeva, a Kashmirian poet of the 11th century. Interesting also as approaching somewhat to the modern picaresque story of low life is the 'Dasa-kumāra-carita' (commented by Dandin in the 6th century), which tells of the adventures of ten princes. Finally, out of Arabia came to the west 'The Book of the Thousand Nights and A Night,' a work in its kind as great as either of the Homeric epics. This treasure-house of stories consists of best

fables, longer and richer in incident than those of India, beautiful tales of magic and fairy land, and histories and historical anecdotes which localize the scene. Over all is the glamour of the moon-lit night and the beautiful princess who relates them. Some of these stories had doubtless been recited for centuries by the professional raconteur, called in Arabic the *rawi*. 'Sinbad the Sailor,' for example, may be older than the 'Odyssey.' But the collection as a whole (which is based upon a Persian original of the 10th century) did not assume definite shape until the 13th century of the Christian era: and the famous 'Ali Baba' and 'Aladdin' exist in no manuscript earlier than the 16th century. Translated first into French and then into English and every language of the west, the 'Arabian Nights,' after scores of imitations, passed into romantic fiction and became a part of it. Scott's 'Talisman' would have been quite different but for this precious inheritance from the east.

The Greeks likewise added to the treasure-house of fiction. Their myths, epics, histories and biographies contained, from Homer to the end, elements clearly novelistic or romantic. The 'Odyssey,' for example, is a skipper's tale, one of many, made beautiful by weaving into it stories, long and short, of Circe, Calypso, Polyphemus, the lotus-eaters, and the fairy realm of the Phæacians. Though we call it a hero-epic, it is really much like a mediæval romance of adventure. Plato was an admirable story-teller, as well as philosopher. Like Defoe he knew how to give an air of reality to fiction by an accumulation of details, not neglecting to tell by the way how he came by his story. The 'Republic' is perhaps too philosophical in aim for more than mention here. But it is the starting point of the scores of Utopias of western Europe from Sir Thomas More to Mr. H. G. Wells. Xenophon all but discovered the historical novel. In his 'Cyropaedia,' he took for his hero the elder Cyrus as representative of a king who by self-control and vigorous self-training became ruler of the world. Running through the romance is a pretty oriental tale, which tells of the beautiful captive Panthea, tempted by Artabanes, but faithful to her husband Abradates. The 'Cyropaedia,' which was translated into French and English in the 16th century, became a model for historical fiction before Scott and gave great impetus to the creation of perfect gentlemen like Sir Charles Grandison. So much and much more may be said for the fiction of ancient Greece. Besides Plato's and Xenophon's, there were many other political, philosophical, and historical tales. All along ran the novelistic treatment of heroic legend; moral allegories were at one time the fashion, and with the exploits of Alexander in India came many geographical wonders and several freely invented biographies of the hero himself, which eventually resulted in the Alexander novel or legend, well-known from its later development by the French poets of the 13th century.

The Greek novel as a cultivated *genre* wholly distinct from other literary forms belongs, however, to a period subsequent to Alexander; to Greece in its decadence after the glory of her letters had departed, when the center of culture was no longer Athens but Alexandria and the

cities of Asia-Minor. Then the erotic tale of adventure took the place of the verse-epic. Of this type the oldest extant specimen is the so-called 'Nimrod Fragment' (1st century, A.D.), which has as subject the love of Nimrod, the legendary founder of Nineveh, for a maiden who may be identified perhaps with Semiramis. The motive for the hero's bravery is not unlike that in the mediæval romance of chivalry. Antonius Diogenes, the Jules Verne of the Greeks, wrote of 'The Marvelous Things Beyond Thule' (2d century), descriptive of a voyage to the North Pole, a descent into Hades, and travels in the sun and moon. To the same century belongs the 'Babylonica' of Jamblichus, a Syrian, so-called because its scene is in and near Babylon. The 'Ephesiaca' of Xenophon of Ephesus (3d century) is built in part on the motif of 'Romeo and Juliet.' 'Apollonius of Tyre' (3d century), known in English since the Anglo-Saxon period, furnished the plot of Shakespeare's 'Pericles.' 'Clitophon and Leucippe' by Achilles Tatius of Alexandria (5th century) abounds in marvels, gorgeous descriptions, and metamorphoses. Best of all in this kind is the 'Ethiopica, or Theagenes and Chariclea' by a Syrian who called himself Heliodorus (5th century). The boy and girl lovers, after separation, adventures, and miraculous escapes, are finally united and live happily ever after. The involved and complicated structure of this tale was taken over into western fiction by Sir Philip Sidney and the French romancers. One beautiful Greek prose-pastoral of the same period has survived: the sweet and sensuous 'Daphnis and Chloe,' the far distant shadow of 'Paul and Virginia.'

The impossible adventure of the Greek tales, especially of the class represented by 'The Marvelous Things beyond Thule,' did not escape the wit and banter of Lucian, the orator and rhetorician. In his 'True History' he sailed with his mariners beyond the pillars of Hercules, on to the moon and morning star, and to the Elysian fields, where he met with the Homeric heroes. "I know what I am saying is incredible," he stops to remark by the way, "but I shall proceed notwithstanding." Lucian was the model of the burlesque romancers from Cervantes to Fielding. Of grotesque adventure in real life, we have from antiquity one fine example in 'The Golden Ass' of Apuleius (2d century), which, though written in Latin, is thoroughly Greek. Aside from its burlesque, the novel contains scenes of coarse and brutal manners mixed with descriptions and episodes of entrancing beauty, like the story of Cupid and Psyche, than which nothing more beautiful has survived for us from ancient romance.

Mediæval Romance.—The Romans had nothing of their own much like a novel, except perhaps the 'Satiricon' of Petronius Arbiter, descriptive of dissolute life in the time of Nero. Their tales and fables were little more than an adaptation of the Greek. But their language, both written and spoken—in Italy, Spain, and Gaul—became the chief medium through which ancient fiction passed to the new nations of the west. The tradition, literary as well as oral, was never quite lost in the darkest period of the middle ages. Another source of transmission was the Crusades, when met the east and the

west. Many a mediæval tale, clearly Greek or oriental in origin, was brought home by the Crusader and told to one and another until some one put it down in writing. The flourishing period of mediæval romance is included in the years between 1150 and 1300. It was then that the poets developed, from Latin sources, the sagas of Alexander, Troy, and the elaborate romance of *Trilussa* and *Cressida*. The new nations possessed, too, their own myths, traditions, and legends. Charlemagne and his peers became the heroes of a romantic cycle; and the French poets, working over Celtic matter, produced the great stories of Arthur, Lancelot, Guenevere, and the Round Table. Most like the modern novel were the French *romans d'aventure*, which are only loosely connected with traditions and may cut themselves wholly free. There are extant scores of these verse-romances, both in French and in English, like 'Guy of Warwick' slightly Saxon in setting, 'Havelok the Dane,' 'King Horn,' and 'Gawain and the Green Knight,' which is one of the best. Certain of them, Greek or eastern in motif or outline, turn upon disguises and beautiful recognition-scenes at the close, just as in Shakespeare's 'Twelfth Night' or 'As You Like It.' Such for example, are the 'Life of Ipyndon' and 'Amis and Amile.' The flower in this kind is 'Aucassin et Nicolette' (part prose and part verse), the story of two lovers of Provence, who, as in Greek romance, are separated to be brought together in happiness at the end. By the side of this charming story may be placed also the less known 'Chastelaine de Vergi,' which announces the intense tragic passion of 'Romeo and Juliet.' More realistic in aim were the *fabliaux*, short poems usually, which dealt with a trick or humorous incident in ordinary life for the purpose of exciting laughter. The main incidents of these tales, mixed with beast-fables, were in many cases transmitted from the east. A point of diffusion was the 'Disciplina Clericalis,' a collection of 26 stories in Latin prose, made by Petrus Alphonsus, a Spanish Jew of the 12th century. Its great successor was the 'Gesta Romanorum' (13th century). Tales of intrigue drawn from these and other sources, when lightly treated in verse, were called *fabliaux*; if neatly turned into Italian prose, they were called *novelle*. At the end of the middle ages stands Chaucer, who, gathering up all the current types of fiction, breathed into them the spirit of a delightful personality. On the way to Canterbury, the knight begins the story-telling with a gorgeous romance of chivalry, the squire stops midway in a tale of eastern marvels, the prioress relates the legend of a saint, and the pardoner is ready with an oriental apologue. The Reeve's tale is an expanded *fabliau*, and the priest's story of Chanticleer and Dan Russell the fox is a *fabliau* and beast-fable in one. Near Chaucer stands Boccaccio, who in the merry *Decameron* retold in prose the older *fabliaux*, giving thereby vogue to the *novella*. [The various types of mediæval fiction are described by Gaston Paris, in 'La Littérature Française au Moyen Âge' (2d ed., Paris 1890). Symonds' 'Renaissance in Italy' contains an account of the Italian *novelle* (vol. V, London 1881).]

Caxton to Richardson.—As in the orient, the mediæval story of western Europe, whether in

verse or in prose, was for the most part something to be related by a professional reciter or others in the gathering of friends, in public squares, or in the stately assemblies of lords and ladies. In the longer tales, verse was the more common inasmuch as rhyme was an aid to the memory. There were, however, persons who preferred to read by themselves the current fictions. For this public, various verse-romances about Arthur, Lancelot, and the Holy Grail were remodelled and expanded, as early as the 13th century, into an immense prose-narrative. The habit of reading, already begun, was greatly extended by the invention of printing, with the result that the old verse-romances were everywhere turned into prose, and the short prose tales were expanded into narratives that might assume the magnitude of an epic or a saga. Conspicuous instances of this transformation are Malory's 'Morte Darthur,' a compendium of Arthurian romance, and the French 'La Fleur des Batailles,' a Charlemagne romance in which Ogier the Dane is the hero. These are but two out of hundreds of examples of what was taking place wherever the printing press was set up. To Caxton and the noble printers that followed him, we are indebted for the creation of a prose style suitable to the novel.

The most striking innovations were made at first in the Spanish Peninsula. Out of a Portuguese verse-romance of adventure then grew up in the 15th century, by accretions from many sources, the famous prose 'Amadis of Gaul,' to which final form was given by a Spanish writer named Montalvo. In its outer structure *Amadis* differs from similar mediæval tales of knightly adventure in that the narrative drifts on, as in Greek romance, to the marriage of the hero and the heroine. It was the first and the best of the modern romances of chivalry, which soon became so numerous as to fill the library of Don Quixote. In a like manner mediæval verse-pastorals were turned into prose, though they usually still retained some mixture of verse. Among the first of them was the Italian 'Arcadia' (1504) by Jacopo Sannazaro. The type was further developed in the Spanish Peninsula by George of Montemayor, whose 'Diana Enamorada' set the fashion for France and England. It was in Spain, too, that some one first had the happy thought of placing behind the scenes of contemporary life a pay scamp to let him relate what he saw there. These so-called picaresque novels, or romances of roguery, began with the anonymous 'Lazarillo de Tormes' (1554) and were popular for a full century. Always realistic in aim and straightforward in movement, the romances of roguery were important forerunners of the modern novel. Akin to them and of still greater significance was 'Don Quixote,' a vast prose-epic, written in burlesque of the romances of chivalry, but carrying along with its banter humorous descriptions of contemporary manners. Don Quixote and his Squire Sancho Panza were by far the most elaborate characters that fiction had yet produced. And no work comparable with that of Cervantes was to appear again in Spain or elsewhere for more than a century.

In France and Italy, the novelistic literature chiefly cultivated at this time, aside from redactions of the older romances and tales, was the

NOVEL

conte or *novella*. Collections of these short stories were sent forth from nearly every city of Italy, and the 'Heptameron' of Margaret of Navarre became a close rival to Boccaccio's 'Decameron.' The great humorist was Rabelais, who made the farcical adventures of Gargantua and Pantagruel the occasion for social satire, weaving into his story as he went along many a coarse jest in the vein of the old *fabliaux*. He was followed by a group of imitators who tried to outdo him in ribaldry and buffoonery, but none of them possessed his immense learning and keen intelligence.

In Elizabethan England, men and women turned to fiction for amusement as well as to the drama. Beginning with Painter's 'Palace of Pleasure' (1566), the Italian *novella* came into English in shoals; the best of the Greek romances were translated from the French; and the Spanish romances of chivalry, pastorals, and rogue-stories were known in part. And whatever England took was worked over into fictions in harmony with her own society. For its wide scope Sidney's 'Arcadia' stands first with its noble chivalry and beautiful pastoral scenes, set in the complicated framework of the Greek 'Ethiopica.' Of slighter texture but none the less beautiful is Lodge's 'Rosalind,' which Shakespeare dramatized in 'As You Like It.' John Lyly's 'Euphues,' highly moral in tone, imitated the romance for the lady's boudoir. Robert Greene, the dramatist, supported himself by writing short tales, such as 'Menaphon,' which he called 'love-pamphlets.' Of all Elizabethans, Greene was by much the most fertile in incident. Two of his stories 'Pandosto' and 'Philomena' were freely used by Shakespeare for 'A Winter's Tale' and 'Cymbeline.' Very curious are Greene's attempts at historical romance, like *Ciceronis Amor*, descriptive of 'the loves of Cicero which Plutarch and Cornelius Nepos forgot in their writings.' Greene also wrote several pamphlets dealing with beggars, rogues, and sharpers, but in this kind he was surpassed by Thomas Nash, who ridiculed his rival's love-pamphlets and ironically alluded to him as 'the Homer of Women.' Nash's 'Unfortunate Traveller or the Life of Jack Wilton' (1594), which relates the adventures and escapades of a young courtier on the continent, was the most carefully wrought of the English romances of roguery.

After the passing of the Elizabethans and of Cervantes (1616), the main stream of European fiction shifted for a century to France. The English 'Arcadia' and the Spanish 'Diana' were more than matched by the 'Astrée' (1607-27), an immense pastoral covering some 5,000 pages, begun by Honoré d'Urfé, and completed after his death by his secretary. Several writers turned to history for a setting to their romances. In 'Cléopâtre,' 'Cassandre,' and 'Pharamond,' La Calprenède dealt in turn with Egypt, Persia, and the legendary founder of the French monarchy. He was succeeded by Scudéri, best known for the 'Grand Cyrus' and 'Clélie, ou Histoire Romaine.' In all cases, historical scenes, incidents, and characters were merely a disguise for a portrait of contemporary society. Scudéri's 'Cyrus,' for example, was drawn for the great Condé, and her Babylon was the Paris of her time. Near the end of the line

came Madame de la Fayette, whose 'Princesse de Clèves' has long been regarded as one of the classics in French fiction. Along with their pastorals and histories, the French continued to cultivate the stories of bourgeois life in line with the older *conte* and *fabliau*. Such were Sorel's 'Francion,' Scarron's 'Roman Comique,' and Furetière's 'Roman Bourgeois,' in which the aim was, to some extent, the ridicule of contemporary manners in low life. Burlesque in the style of Cervantes or Lucian made its appearance in Sorel's 'Berger Extravagant,' a hit at the 'Astrée,' and in Boileau's 'Héros de Roman,' descriptive of the descent of Scudéri's heroes into Hades to be flogged and cast into Lethe.

Through translation, the ponderous French romances became almost as popular in England and Germany as in the land of their birth. In both countries coteries of fashionable men and women were formed for reading and studying them as if they were all classics. Occasionally there was an imitation, like Roger Boyle's 'Parthenissa' or John Crowne's 'Pandion and Amphigenia.' Outside of their influence was Grimmelshausen's 'Simplicissimus,' the first of the German realistic novels, which described the adventures of a vagabond during the awful desolation of the thirty years' war. In this novel the picaresque element is quite apparent as well as in the 'English Rogue' . . . a Complete History of the Most Eminent Cheats of Both Sexes,' composed jointly by one Richard Head and Francis Kirkman, a London bookseller. Mrs. Aphra Behn, the dramatist, set the fashion in England for scandalous tales of high life. Among her successors were Mrs. Mary Manley and Mrs. Eliza Haywood. Quite apart from these immoralities was Mrs. Behn's 'Oroonoko,' which gives a realistic account of a royal slave barbarously put to death at Surinam, where the author had lived for some years.

Interesting as much of this 17th century fiction may be, it is, with the exception of the 'Princesse de Clèves' and now and then another story, affected in style and involved in structure. A better and plainer narrative came with Bunyan's 'Pilgrim's Progress,' the newspapers, the biographers, and the essayists. Steele and Addison described clearly scenes in London and the provinces; they deftly sketched and contrasted men and women as they knew them, with agreeable banter of prevailing absurdities in dress and conduct. In doing this they were really nearer to the modern novel than the romancers and the storytellers. And so was Defoe. He and Swift wrote the language that men speak in ordinary discourse, making fiction seem like truth. 'Robinson Crusoe' is indeed our prose 'Iliad.' Except for minor details, we have no better narrative in English; and the hero is a typical Englishman of the class to which he belongs, behaving as an Englishman should behave if cast upon a desert island. In France, the Spanish picaresque novel was at this time cleverly employed by Le Sage in his 'Gil Blas' for social satire; and Marivaux, in a novel called 'Marianne' began the delicate analysis of emotion. Not to be forgotten, too, is 'Manon Lescaut' by the Abbé Prévost, a charming tale on the 'divine' right of passion.

NOVEL

Richardson to Scott.—For centuries, stories, tales, and romances of all sorts had been set adrift; contemporary manners had at times been depicted under the guise of history and the pastoral life, and from the standpoint of rogues and adventurers. But no one, not even Cervantes, had ever been able to keep before him for long the ideal of the novel as we now understand it: to wit, the direct and faithful portrayal of character amid the scenes of real life. Strange to say, too, no one had ever seen that for this end much might be learned from the drama, that a narrative might be made closely and logically dramatic. These discoveries were left for Samuel Richardson, a London printer of no rank and little schooling. The interest in his first novel, to which he gave the name of *Pamela* (1740), centers about the distress of a beautiful waiting-maid of humble birth. Her mistress dies and then the son and heir tries to win her to a dishonorable alliance. After a protracted struggle of will against will, the young man repents of his evil-doing and marries the young woman whom he would have betrayed. It is a simple story that may be told as here in two or three sentences. But for his treatment of the theme Richardson required two volumes, to say nothing of a continuation. During and after each struggle there were sensations to record; many characters had to be introduced as participants in the action; and the whole narrative was made to move from incident to incident with the logic of the drama, up to a climax and on to a catastrophe. When he had done with '*Pamela*,' Richardson had created, perhaps without being aware of it, a novel from which characters emerge as clear and definite as from the drama, and in much greater detail. Richardson attained to his full stature in '*Clarissa Harlowe*,' wherein a tragic theme is unfolded with great skill. His career closed with '*Sir Charles Grandison*.' The plots of the three novels were developed, oddly enough, by imaginary letters, which pass to and fro between the more important characters.

The formula of the novel once discovered, it was easy for a man practised in letters to improve upon the humble printer. Henry Fielding, essayist and playwright, wrote '*Joseph Andrews*' to show Richardson what a novel ought to be, and afterwards went on with '*Tom Jones*' and '*Amelia*.' Fielding was a great humorist in direct descent from Lucian and Cervantes. The novel, as he understood it, was an immense comic-epic running on in the well-polished grooves of the drama, but suspended at intervals that the author might converse with the reader about his art, his fame, and the conduct of his characters. Knowing England better than any other man of letters in his day, Fielding conveyed the wealth of that knowledge into characters like Parson Adams, Squire Western, and Tom Jones, who always stand out full and complete. While the great master was at work on '*Tom Jones*,' Tobias Smollett took the field with '*Roderick Random*,' our first novel of the sea, which was followed by '*Peregrine Pickle*'; '*Count Fathom*'; '*Sir Launcelot Greaves*'; and '*Humphry Clinker*.' If Fielding was a comic writer who delighted in exposing to ridicule vanities and affectations, Smollett

was a satirist who lashed hypocrisy and the darker vices with the glee of a madman. He had in him also the spirit of fun, which welled up splendidly in '*Humphry Clinker*,' 'the most laughable story,' said Thackeray, 'that has ever been written since the goodly art of novel-writing began.' In the meantime Oliver Goldsmith had condensed the Richardson novel and given it a charming background in country life. From the '*Vicar of Wakefield*' dates the brief pastoral-tale since common throughout Europe. Perhaps Laurence Sterne should not be classed with the novelists. He was rather a humorist who played with the novel. '*Tristram Shandy*' is a sort of novel written backwards. After setting out with the prenatal history of his hero, Sterne drops him and reverts to Tristram's uncle and father and elaborates their characters, without much attention to the main story. Of orderly narrative Sterne was, however, a master when he chose to be, as in the death of Yorick and throughout the '*Sentimental Journey*,' which is a record of his emotions on a tour through France, from Calais to Paris and on through Languedoc in the vintage season. Sterne's art at the best was exquisite and wonderful, whether in the minute delineation of Walter Shandy and my uncle Toby or in the minor emotional portraits of his sentimental travels. Translated into French, German and other languages, Richardson and Sterne reinforced the stream of emotional literature on the continent. For France the outcome was Rousseau's '*Nouvelle Héloïse*,' and, at a later date, Saint-Pierre's '*Paul et Virginie*,' Chateaubriand's '*René*' and Madame de Staël's '*Corinne*.' For Germany the outcome was a long line of sentimental novels at the head of which stood Goethe's '*Leiden des jungen Werther*.'

Owing to changed social conditions, the novel broke up into new types after the death of Sterne. Among large numbers of people in England and France, interest in the comedy and tragedy that grow out of love and intrigue gave way, in the years before the French Revolution, to the larger social and political relations and to theories of education and government. The novel at once became the popular medium of current speculation, incorporating into itself the tract, the pamphlet, and the treatise. The novel of distinct purpose which began with Rousseau's '*Emile*,' was continued by many English writers including Thomas Holcroft and William Godwin, the author of '*Caleb Williams*.' In other hands the novel absorbed romance. The so-called Gothic romances all sprang from '*The Castle of Otranto*,' a nightmarish tale by Horace Walpole. Among Walpole's successors were Clara Reeve; Mrs. Ann Radcliffe, author of the '*Mysteries of Udolpho*'; 'Monk' Lewis; and Charles Brockden Brown, the American. In Germany there was a similar tendency to romance and superstition as illustrated by the work of Tieck and Hoffmann.

Meanwhile, a group of novelists, mostly women, held more nearly to older traditions. 'Evelina' and 'Cecilia' by Frances Burney (afterwards Madame d'Arbigny) brought the public back to London—to assemblies, Ranelagh, the opera and Drury Lane, where thronged the world of fashion with nothing to do. With

Miss Burney began the novel of manners in the most restrictive meaning of the phrase. Hitherto characters had been differentiated by what they said and did. Miss Burney laid equal stress upon how they spoke and how they behaved, upon tone, look, and gesture. From her art it is an easy transition to the character-types of Maria Edgeworth. One may pass by, good as they are. Miss Edgeworth's tales of fashionable life and various fictions in which she sought to reform English society from top to bottom, for her stories of Irish life such as 'Castle Rackrent' and the 'Absentee,' wherein first appeared the Irishman as he really is, behaving himself in those ways that seem so absurd to an Englishman, and engaging in no long conversation without one or more of those delightful blunders in speech known as Irish bulls. From Miss Edgeworth's sketches, as she called them, flowed all these Irish tales which for the next fifty years flooded England. Miss Burney and Miss Edgeworth shared one defect, for neither of them knew how to manage a story. Their many natural and vivacious scenes are more or less detached and never firmly held together. But the art of Fielding, long since lost, was now to be regained and refined by Jane Austen, a woman of gentle breeding and charming style. Her first novel to be printed was 'Sense and Sensibility;' then followed 'Pride and Prejudice,' 'Mansfield Park,' 'Emma,' 'Northanger Abbey,' and 'Persuasion,' of which the best is the novel one happens to be reading. The scenes of them all were laid in South England, where Jane Austen passed her life. Without employing the conventional devices of the novelist, she was able to awaken interest by the manner in which she developed her story, the nice discrimination between men and women much alike to the ordinary observer, and the wit and irony that accompanied the entire performance. Jane Austen was in a sense the last of her line, completing the work of Miss Burney and Miss Edgeworth; she also set the clock to the delicate impressionism of the nineteenth century.

Sir Walter Scott.—Scott, equally with Richardson, marks an epoch in the course of European fiction. From the earliest times, as in Egypt and Greece, history had been an adornment to the tale or story. Shakespeare and many others had written historical dramas. The French romances of the 17th century, many of them, were historical allegories. The Gothic writers laid their scenes in mediæval or early modern times. With several romancers just before Scott, history was a still more definite aim, especially with Jane Porter, author of the 'Scottish Chiefs.' But none of Scott's predecessors had the historian's perspective. None of them did much more than project the present into the past. Scott's aim was to restore as carefully as he could the manners and customs of our forefathers, to tell as how they behaved under the stress of civil and political commotions. The historical novel, as Scott organized it, was, then, the novel of manners pushed back, at first one or two generations, and eventually to the middle ages. He began, in 'Waverley' (1814), with Scotch scenes; and after exhausting interest in Scotland, he crossed the border, writing 'Ivanhoe,' then he crossed the channel, writing 'Quentin Dur-

ward,' and finally he went on to the east, to the camp of the Crusader. All Europe stood in admiration of the extraordinary feat. Scott was clearly the founder of the historical romance. His numerous imitators in England included Horace Smith, G. P. R. James, W. H. Ainsworth, and in part Dickens and Thackeray. Under Scott's direct inspiration, Cooper launched his great romances of the forest celebrating the career of Leather-Stocking; and as a challenge to the seamanship of Scott's 'Pirate,' he wrote 'The Pilot,' to be succeeded by other romances of the sea. From Scott, too, proceeded the German historical romances, from Wilhelm Häring on through Gustav Freytag and Georg Ebers. In Italy Scott's influence began with Manzoni's 'Betrothed,' and in France with Alfred de Vigny, Prosper Mérimée, and Victor Hugo. Finally, the historical romance was transformed by the elder Dumas, a writer of rare narrative and descriptive powers, into tales of breathless adventure like the 'Trois Mousquetaires.' [On Scott and the historical novel, consult especially, Maigron, 'Le Roman Historique' (Paris, 1898), and Stephen, 'Hours in a Library' (first series, London, 1874).]

Varied Types of the 19th Century.—By 1832, the year of Scott's death, romance had run its immediate course in England, though there were many survivals. The passage of the Reform Bill and other legislation led to a break-up of society; the older bourgeoisie fared badly, losing their homes and drifting to debtors' prisons and workhouses; and a new middle class rose to wealth and power. The manners, virtues, and vices of the new order became at once the main theme of the novelists. Bulwer-Lytton, who could write at will a history, a sentimental romance, a criminal novel, a ghost story, or a Utopia, well illustrates the transition from romance to the novel of contemporary manners. Dickens was the chronicler of those who had suffered most by political and social changes. Beginning with 'Pickwick' (1836-37), a long series of comic sketches unexcelled in their kind, he definitely struck the humanitarian note in 'Oliver Twist' (1837), which dealt, in humor and pathos, with the workhouse and the new poor-law. He thereafter passed in review private schools, public education, prison discipline, the red-tape of Downing street, delays in the Court of Chancery, graft (we should now call it) in business and the professions, and all sorts of hypocrisy and meanness that oppressed the people. Despite the sordidness of their matter, all of Dickens's novels were ennobled by the author's lofty idealism, and made delightful by a sense of humor that never deserted him. Those that were wrought out of the author's most intimate experience—'David Copperfield,' for example—were no doubt the best; but Dickens could interest when he took, as in 'Hard Times,' a subject about which he knew little or nothing. His Christmas stories were national events. Of immense creative power, Dickens added to fiction hundreds of humorous types, among which are Mr. Pickwick, Sam Weller, Micawber, and Dick Swiveller. He was, however, surpassed in fertility by his early French contemporary, Honoré de Balzac, who in the vast 'Comédie Humaine' endeavored to portray every phase of French life, traversing

NOVEL

its hell, purgatory, and paradise. But what fell without the ken of Dickens was taken up by other novelists. Charles Kingsley, now better known for 'Hypatia' and 'Westward Ho!' canvassed the questions at issue between labor and capital, in 'Yeast' and 'Alton Locke,' drawing by the way vivid pictures of sweat-shops and the distress of agricultural laborers. Mrs. Elizabeth Gaskell, in 'Mary Barton' and 'North and South,' described the frightful condition of women and children in the great manufacturing towns of North England. And Benjamin Disraeli created a sensation by his trilogy, 'Coningsby,' 'Sybil,' and 'Tancred,' dealing in turn with "the state of parties," "the state of the people," and "the state of the Church of England." Disraeli's first novels, impressive for their scope, were all marked by keen intelligence, wit, and mockery. [The relation of Dickens, Kingsley, Gaskell, and Disraeli to their times is exhaustively treated by Cazamian, 'Le Roman Social en Angleterre' (Paris, 1904).]

In the meantime Thackeray was depicting, with matchless humor and irony, the ways of the well-to-do middle class to which he himself belonged. 'Barry Lyndon,' the 'Book of Snobs,' various burlesques of contemporary novelists, and a multitude of sketches were succeeded by 'Vanity Fair,' a novel without a hero. No English novel since 'Tom Jones' had contained so much of real life. It was a humorous transcript of what was going on among the rich bankers and merchants in Bloomsbury, with some invasions into the disreputable aristocracy of Belgravia. In 'Pendennis' Thackeray described much of his own career; and in the 'Newcomes,' he returned, though taking the edge from his irony, to the theme of his first novel. Finally, he carried his realistic methods into history, writing 'Henry Esmond' and the 'Virginians,' of which the former is rightly regarded as the best historical novel in English.

'Esmond' is, however, hard pressed for first place by the 'Cloister and the Hearth,' by Charles Reade, who also wrote several admirable novels under the humanitarian impulse, such as 'It is Never Too Late to Mend.' To the same period belong Charlotte Brontë's 'Jane Eyre,' 'Shirley,' and 'Villette,' and her sister Emily's 'Wuthering Heights,' all of which are Byronic in the vehemence of passion. In the United States, Poe and Hawthorne had moulded the short-story to a beautiful form, and the latter's 'Scarlet Letter' at once took rank among the great fictions. To Anthony Trollope descended Thackeray's humor, without, however, the master's irony and genius. For 20 years Trollope was the delight of a large audience. He was the easy and amusing chronicler of every-day English life, rising to his highest powers in the tales of cathedral life, which began with 'The Warden' and 'Barchester Towers' and closed with the 'Last Chronicle of Barset.' This series of delightful novels, no doubt, suggested to Mrs. Margaret Oliphant the 'Chronicles of Carlingford,' dealing with the ways of Dissenters. 'Salem Chapel' and 'Miss Majoribanks,' among the best of them, give Mrs. Oliphant a permanent place in the course of English fiction.

With Marianne Evans, known in letters as "George Eliot," there entered into the English novel a new and profound personality. Hitherto moralists and philosophers had tried fiction with no great success. But George Eliot, besides her large acquirements from books, possessed wit, humor, and a fund of fresh observation. Beginning with 'Scenes of Clerical Life,' based upon incidents and traditions brought over from her life as a Warwickshire girl, she published in 1858 'Adam Bede,' her first long novel. It was quite different from any other novel that had ever been produced. True, it ran on the lines of the conventional story of a young woman's betrayal; but beneath the outer sequence of incident was a relentless study of motive, clearly and logically developed from beginning to end. It was the first purely psychological novel ever written. Still more impressive work followed in 'The Mill on the Floss,' 'Romola,' and 'Middlemarch.' At the same time George Meredith was finding his way to the psychological novel. His 'Ordeal of Richard Feverel' appeared in the same year as 'Adam Bede,' but his subtle psychological manner came later, in the 'Egoist' and 'Diana of the Crossways.' Narrower in his outlook than George Eliot, he took fewer characters for his studies, carrying the analysis of motive to a refinement that sometimes rendered him unintelligible. And Henry James has since refined upon Meredith. The stories whereby James first won attention were international episodes, delightfully objective in method, like 'Daisy Miller,' depicting by contrast American and European types and manners. But by 1890, he began very complex studies of unconventional phases of English life, and adopted for his purpose an involved and indirect style, with the result that most readers are now uncertain just what happens in a novel like the 'Golden Bowl,' for the incidents must be largely inferred from the characters.

It is impossible to relate here in detail what has been done for fiction on the continent since the death of Balzac. In France, Flaubert and Daudet were the great literary artists of their time. Zola, who established the vogue of "the naturalistic novel," described the ugliest aspects of life with a boldness never before attempted in fiction. Paul Bourget, since 1892, has been the exponent of psychology. Scandinavia's representative has been first of all Björnsen. Sienkiewicz, author of 'Quo Vadis' and an impressive trilogy dealing with the struggles between the Poles and the Cossacks, may stand for Poland. Among Germany's numerous novelists are Paul Heyse, author of 'Kinder der Welt,' Spielhagen, who presented his ideal of a novel in a collection of essays on the 'Theory and Technique of the Novel,' and Sudermann, the dramatist, whose pathetic 'Franz Sörge' soon found its way to English readers. Russia produced a novelist of the first rank in Turgenieff, whose art—say in 'Fathers and Sons'—is quite beyond praise; its influence has been long potent in the west. Tolstoi, since 'Anna Karenina,' has treated current social problems in novels of absorbing interest. His novels read, not like fiction, but as if they were genuine documents on contemporary life. Tolstoi is the world's master realist.

Howells, who has often interpreted Tolstoi in brief essays, has held firmly to a realistic treatment of current types and manners, eliminating so far as possible the conventional plot which the novel early took over from the drama. His 'Rise of Silas Lapham' is by far the best American novel of the present generation. Hardy is the English novelist of most thought and substance since George Eliot. He struck the note of his stern realism in 'A Pair of Blue Eyes' and 'Far From the Madding Crowd,' and rose to the height of his genius in 'Tess of the D'Urbervilles.' Mrs. Humphry Ward gained her public with 'Robert Elsmere,' and after writing several other problem novels, shifted her theme in 'Lady Rose's Daughter' and the 'Marriage of William Ashe,' to beautiful women in risky situations. A tendency towards the abnormal in recent fiction, slightly visible in Mrs. Ward, is best represented by Mrs. Harrison's 'Sir Richard Calmady.' The intensity of Hardy's tragedy, though less well-rendered, has descended to Phillpotts, author of the 'Secret Woman' and other Wessex novels. More apart is Miss Sinclair's 'Divine Fire,' an excellent novel after the old order.

Towards the close of the 19th century, the English novel passed through a brief cycle of romance, history, and adventure. No decade and perhaps no year since Scott and Dumas had been without an historical novel or a story of adventure. In recent years Blackmore's 'Lorna Doone' had been received with delight by a wide public; and Shorthouse's 'John Inglesant,' a spiritual romance of singular beauty, had met with almost equal favor. But the novelist who revived history and adventure as a fashion was Stevenson. He became for his time a lesser Scott, though, in technical detail, he surpassed his countryman. Beginning with 'Treasure Island,' a story of pure adventure, he passed on through the ethical parable of 'Dr. Jekyll and Mr. Hyde' to 'Kidnapped,' 'David Balfour,' and the 'Master of Ballantrae,' which were tales of adventure in an historical background after the style of Dumas. These and other tales and short stories, admirable in form and style, and revealing a charming personality, won the hearts of the critics as well as of the larger public. As in the case of Scott, Stevenson was accompanied and followed by scores of historians, among whom were Conan Doyle, S. R. Crockett, Stanley Weyman, Anthony Hope Hawkins, Weir Mitchell, Mary Johnston, Gertrude Atherton, and Winston Churchill. Most of this work, though there are exceptions, is mechanical in execution and is destined to pass quickly into oblivion. But Maurice Hewlett especially has made an interesting psychological study of Mary Queen of Scots under the title of the 'Queen's Quair,' and in the 'Forest Lovers,' 'Little Novels of Italy,' and 'New Canterbury Tales,' he has revived in his own beautiful way the spirit of the renaissance and the middle age.

No less interesting than the recrudescence of romance has been the exploitation of remote districts and countries for fresh material. Until the earth has now become well-nigh exhausted. First of all comes to mind Kipling, who revealed India in tales of wonderful vigor and insight, like those in collections named 'Soldiers Three,'

'Phantom Rickshaw and Other Tales,' 'Many Inventions,' and in 'Kim,' a longer novel, while his 'Jungle Books' have given rise to an extensive animal literature. Conrad has carried the novel to the Malay Peninsula, and Horning to Australia. Hichens has described an oasis in the Sahara and the road to Timbuctoo. Coming nearer home, Barrie and Watson have discovered the humor and pathos of the peasantry of Scotland. In the United States, the novel of provincial character has been long practised by Mary Wilkins Freeman, Sarah Orne Jewett, Mary Murfree, Bret Harte, G. W. Cable, T. N. Page, Hopkinson Smith, and scores of others. Throughout the long period Mark Twain has been the supreme humorist. Recently Owen Wister and Hamlin Garland have invaded the northwest, and Elizabeth Robins Parkes has written of the Klondike. Other contemporary writers must be passed by, though in many cases they deserve mention here for their talent and sincerity. Striking narrative power is possessed, for example, by H. G. Wells and Jack London.

The 20th century opens with a remarkable vogue of the short-story, so well adapted to the newspaper and magazine. Short narratives in prose have been cultivated from the earliest times. Egypt and India had them long before the dawn of modern civilization. As *novelle* they were brought to high finish by Boccaccio, and ever since his time they have been frequent in all the literatures of the west. But a new type, depending less upon narrative interest than upon conveying a definite impression or an emotional state, came in with Poe and Hawthorne. Short stories of this kind, containing few characters and shorn of unnecessary incident, were exquisitely wrought by Daudet and Maupassant. Less clean-cut but admirable in their several styles are the short stories of James, Stevenson, Kipling, Hewlett, Aldrich, Edith Wharton, and many another writer. In the short story rather than in the longer novel one just now finds the best workmanship.

Bibliography.—Egypt and the East.—The best Egyptian stories were translated into English by Petrie, 'Egyptian Tales' (2 vols. London 1895); and into French by Maspéro, 'Les Contes populaires de l'Égypte ancienne' (Paris 1889). Consult also Warner, 'The World's Best Literature' (New York 1897) for specimens. A concise account of the tales of India is given, with a full bibliography, by Macdonell, 'A History of Sanskrit Literature' (New York 1900); and a more extended account by Schroeder, 'Indiens Litteratur und Kultur' (Leipzig 1887). For specimens, consult Jacch, 'Hindoo Tales' (London 1873); Burton, 'Vikram and the Vampire' (new ed. London 1898); and 'World's Best Literature'. The most faithful translations of the Arabian Nights are by Burton (10 vols. London 1825-86, and six supplemental vols. 1887-88), by Payne (8 vols. London 1882-83), and by Lane, edited by Jacobs (6 vols. London 1808). Burton's translation was abridged by Lady Burton (six vols. London 1887-88).

Greece.—The standard book on the Greek novel is Rohde, 'Der Griechische Roman' (new ed. Leipzig 1900), of which a summary was made by Schwartz, 'Fünf Vorträge über den Griechischen Roman' (Berlin 1896). Con-

NOVEL CONSTITUTIONS—NOVGOROD

sult also Salverte, 'Le Roman dans la Grèce ancienne,' Dunlop, 'History of Prose Fiction' (rev. ed. London and New York 1888); Warren, 'A History of the Novel previous to the 17th Century' (New York 1895). For translations, see 'Greek Romances,' and the 'Golden Ass' of Apuleius in Bohn's Library, and the 'Works of Lucian' translated by Fowler (Oxford 1905).

England.—Cross, 'Development of the English Novel,' a summary of English fiction from mediæval romance to Kipling (new ed. New York 1905). Dunlop, 'History of Prose Fiction,' to Scott (rev. ed. London 1888); Raleigh, 'The English Novel,' to Scott (New York 1894); Jusserand, the 'English Novel in the Time of Shakespeare' (London 1890); Lanier, 'The English Novel and the Principle of its Development,' from Richardson to Eliot (rev. ed. New York 1897); Stoddard, 'The Evolution of the English Novel,' presenting a theory of development (New York 1900); and Matthews, 'Aspects of Fiction,' of the present day (New York 1896). Besides these general works covering the periods indicated, essays on special aspects of the novel are numerous in the works of Leslie Stephen, Saintsbury, James, Stevenson, Howells, and Brander Matthews. The field is well covered by Perry in 'A Study of Prose Fiction' (Boston 1902). Among works of reference may be cited Baker, 'A Descriptive Guide to the Best Fiction' (London 1903); Nield, 'A Guide to the Best Historical Novels and Tales' (3d ed. New York 1903), and Dixon, 'Subject Index to Universal Prose Fiction' (New York 1897).

Spain.—For the Spanish novel as a whole, consult Ticknor, 'History of Spanish Literature' (4th ed. Boston 1871), and for a brief summary Clarke, 'Spanish Literature' (London 1893). The picaresque novels are described by Chandler, 'Romances of Roguery' (New York 1899); and by De Haan in 'An Outline of the History of the Novella Picaresca in Spain' (The Hague and New York 1903). Consult also Dunlop and Warren as cited above.

France.—Paris, 'La Littérature Française au Moyen Âge,' for mediæval types (2d ed. Paris 1890); for 17th century, Korting, 'Geschichte des Französischen Romans in XVII Jahrhundert' (Leipzig 1885-87), and Breton, 'Le Roman au dix-septième Siècle' (Paris 1890); for the 18th century, Waldberg, 'Der Empfindsame Roman in Frankreich' (Strassburg 1906); and for the last century, Gilbert, 'Le Roman en France pendant le XIX Siècle' (rev. ed. Paris 1896); Wells, 'A Century of French Fiction' (New York 1898); and Brunetiere, 'Le Roman Naturaliste' (new ed. Paris 1892). In various essays Brunetiere has covered nearly the whole field from the beginning of the 18th century.

Germany.—Mielke, 'Der Deutsche Roman des XIX Jahrhunderts' (Braunschweig 1890); Rehorn, 'Der Deutsche Roman' (Köln and Leipzig 1890); and Spielhagen, 'Beiträge zur Theorie und Technik des Romans' (Leipzig 1883).

The Short-Story.—Specimens of tales and short stories from the Egyptian survivals to the present day are given by Jessup and Canby, with an introductory essay on the *genre*, in 'The Book of the Short Story' (New York 1903). The art of the short-story has been admirably treated by Matthews in 'Philosophy of

the Short-Story,' in 'Pen and Ink' (New York 1888) and by Perry in 'A Study of Prose Fiction' (Boston 1902).

Further information on the novel may be gained by consulting the articles in this encyclopedia on the various literatures and on the leading writers mentioned in this essay.

WILBUR L. CROSS,

Professor of English, Yale University.

Novel Constitutions, or Novels, in law, were the supplementary constitutions of some Roman emperors, and, especially those of Justinian, so called because they appeared after the authentic publications of law made by such emperors. The Novel Constitutions (also called Novels), together with the Institute, Digest, and Code, constitute the whole body of law which passes under the name of Justinian.

Novellette, (1) in music a term denoting certain compositions in free form, characterized by a great number of short themes introduced without regular succession. Schumann (q.v.) was the inventor of this composition. **(2)** An abbreviated novel, or short work of fiction; a short story usually contains from 1,000 to 20,000 words; a novelette from 20,000 to 40,000, and a novel from 40,000 words upward.

Novellino, nò-vèl-lè-nò, Il, or Cento Novelle Antiche, a 13th century collection of Italian stories of a very multifarious character taken from every possible source, biblical, classical, chivalrous, and historical. The style is simple and natural and often distinguished by a charming naïveté.

Novello, Vincent, English composer: b. London, England, 6 Sept. 1781; d. Nice, France, 9 Aug. 1861. He was one of the founders of the Philharmonic Society of London, and of Novello, Ewer & Company, London music publishers. His contributions to cathedral music are valuable, and in editing the unpublished compositions of great musicians he accomplished an important work.

November, (from novem, nine), the eleventh month of our year and the ninth month of the Roman year when it consisted of 10 months. It has 30 days, and in Great Britain is generally regarded as perhaps the gloomiest period of the year. The first day of the month is All Saints Day. (See CALENDAR.) In the United States Thanksgiving Day comes in November.

Novgorod, or Veliki-Novgorod, ("Great Novgorod"), Russia, (1) a town, capital of the government of Novgorod, on the Volkhoff, near the point where it issues from Lake Ilmen, 103 miles southeast of Saint Petersburg. It is divided by the river into two parts, which communicate by a stone bridge. The portion of the town on the right bank contains in its centre the Kremlin, or citadel. Within it is the cathedral of Saint Sophia, built after the model of Saint Sophia at Constantinople; besides which there are numerous churches and several monasteries. The town-hall, post-office, and commercial building stand on the left bank of the river. The manufactures are of little importance, and consist of sail cloth, leather, tobacco, candles, vinegar, etc. The trade in corn, flax, and hemp, carried on chiefly with the capital, is considerable.

Novgorod was in early times the capital of an independent state. So great was its power and wealth that it excited the jealousy of the Muscovite princes, and in 1478 the Czar Ivan III. nearly destroyed the city, deprived it of its liberties, and banished its most influential citizens. On the opening of Archangel to English traders, but more especially after the founding of Saint Petersburg, the town rapidly declined. Pop. (1897) 26,095. (2) The government of Novgorod has an area of 47,236 square miles. Pop. (1897) 1,392,933, chiefly engaged in agriculture and stock-raising.

Novibazar, or **Novipazar**, Turkey, the capital of the sanjak of Novibazar, Kossovo, on the Raskha, 130 miles southeast of Bosna-Serai. There are no public buildings worthy of notice except the ruined citadel. It is the chief point of communication between Bosnia and Turkey; several of the chief roads of the country cross each other here. By the terms of the Treaty of Berlin of July, 1878, the livs or district of Novibazar is maintained under a dual Austro-Turkish control. Pop. 12,000.

Novice. See **NAUPHYTZ**.

Novikoff, **nov'ikof**, **Nikolai Ivanovitch**, Russian author: b. near Moscow, Russia, 27 April 1744; d. there 30 July 1818. He entered the Imperial service, but soon turned his attention to literature, and became editor of the Moscow 'Gazette.' He established in Moscow a Typographical Society, whose purpose was to further inexpensive reprints of valuable books, and he also founded there the first circulating library in Russia, and in various ways endeavored to promote the cause of education. He was imprisoned for writing 'A History of the Jesuits,' and his other works include: 'The Painter'; 'Russian Biographies'; etc. See **Gretch**, 'Essai sur l'Histoire de la Littérature Russe.' Consult: **Luginoff**, 'Novikoff and the Moscow Martinists' (1867).

Novikoff, **Olga Kiseff** ('O. K.'), Russian political writer: b. Moscow 1820. Her parents belonged to the nobility, and at 19 she was married to Gen. Novikoff. She removed to England and there found friends among the most eminent statesmen of the day. Her political writings, signed 'O. K.', aimed to further an Anglo-Russian alliance and continued the work of her brother who was killed in the Turkish war. She has published: 'Is Russia Wrong?'; 'Friends or Foes'; 'Skobeloff and the Slavonic Cause'; etc.

Novo Cherkaska, **nov'vô chër-kàs'kâ**, Russia, city, capital of the province of the Don Cossacks; near the Don River, about 40 miles from its entrance into an arm of the Sea of Azof. Anthracite coal mines and rich farm lands are in the vicinity. Two large fairs are held here each year, which bring considerable trade to the city. It has a number of manufacturing establishments, several excellent schools, and a large library. Pop. (1901) 55,000.

Novum Organum (literally, new method or instrument), a famous work by Francis Bacon, published in 1620. It forms the second part of Bacon's philosophical work entitled 'Instauratio Magna,' 'The Great Restoration' of Sciences. The first part, 'De Augmentis Scientiarum,' is an extension of the previous work on the 'Advancement of Learning.' The

third is the 'Historia Naturalis.' The 'Novum Organum' contains the outlines of the scientific or inductive method; namely, that of proceeding from facts to general laws, instead of inferring facts from assumed general principles which have never been proved. This latter, the philosophical and metaphysical method, was repudiated by Bacon, and together with the 'superstitions' of theology, was declared to have no place in the new learning. The 'New Method,' therefore, is an attempt at an interpretation of nature from direct observation.

Novy, **Frederick George**, American chemist: b. Chicago, Ill., 9 Dec. 1864. He was graduated from the University of Michigan in 1886 and studied in Berlin. In 1891 he became assistant professor at the University of Michigan, and was several times promoted until in 1902 he was made professor of bacteriology. He was at Pasteur Institute in Paris in 1897 for the prosecution of his studies, and in 1901 he formed one of the United States commission to investigate the plague in the Orient. He has written: 'Cocaine and Its Derivatives' (1897) and several books in collaboration.

Nowanagar, **nô-wâ-nâ-gâr'**, or **Nawanagar**, **nâ-wâ-nû-gâr'**, India, the seaport capital of a native Gujarat state in the Kathiawar peninsula, at the mouth of the Nagna, on the Gulf of Cutch, 54 miles east of Rajkot, with which it is connected by a branch railway line. It is noted for its textile manufactures, pearl fisheries, and carries on an active export and import trade.

Nowell, **nô'el**, **Increase**, English colonist in America: b. 1590; d. Boston 1 Nov. 1655. One of the original patentees of the Massachusetts Bay Company, in 1630 he came to New England; about 1632 was dismissed from Boston because of his urging the separation of Church and State; and became one of the founders of Charlestown. He was outlawed by the English authorities for failure to appear before them. Nowell was secretary of the colony 1644-9, and was chaplain to the force sent against the Narragansett Indians. He died in poverty, but a large land grant in New Hampshire was voted by the colony to his widow and his son, Samuel (1634-88), who had distinguished himself in the swamp fight with the Narragansetts.

Nox. See **Nyx**.

Noyades, **nwâ-yâd**, in French history, the name given to the execution of political offenders by drowning them, practised during the Revolution, especially during the Reign of Terror, by Carrier et Nantes. The method adopted was crowding the victims into a boat, withdrawing a plug in the bottom, and casting them adrift.

Noyau, **nwô-yô'**, a French liqueur prepared from white brandy, bitter almonds, sugar-candy, grated nutmeg and mace, and sometimes flavored with the kernels of apricots, peaches, the peel of oranges, etc.

Noyes, **noiz** or **nois**, **Arthur Amos**, American chemist: b. Newburyport, Mass., 13 Sept. 1868. He studied at the Massachusetts Institute of Technology and at Leipzig University, and became instructor 1887, assistant professor 1894, and professor of theoretical and organic chemistry 1899, in the Massachusetts Institute of Technology. He made valuable original

NOYES — NUDIBRANCHIATA

studies of the relation of the law of mass action to the solubility of salt mixtures, contributed other papers to the *Zeitschrift für physikalische Chemie*, and wrote: 'A Detailed Course of Qualitative Chemical Analysis of Inorganic Substances' (1895); 'Class Reactions and Identification of Organic Substances' (1899, with Milliken); and 'General Principles of Physical Science' (1902).

Noyes, John Humphrey, American author and founder of the Oneida Community (q.v.): b. Brattleboro, Vt., 6 Sept. 1811; d. Niagara Falls, Canada, 13 April 1886. His father was a representative in Congress 1815-17, and his mother an aunt of President R. B. Hayes (q.v.). He studied at Dartmouth, took theological courses at Andover and Yale, was licensed to preach in 1833, and soon lost this license, having professed second conversion, a belief in the dual sexual nature of God, and the doctrine that the Christian is bound by no rule of duty or conduct. With these tenets and an attempted return to the communism of the primitive Church, he gathered round him a Perfectionist Community at Putney, Vt., whose practice of complex marriage forced them to migrate to Oneida, N. Y. But there, too, they outraged public sentiment, so that they gave up their peculiar tenets in 1880, and Noyes and some of his adherents removed to Canada. He wrote: 'The Berean,' which may be called the 'Bible of the Oneida Community' (1847); 'The Second Coming of Christ,' that is in 70 A.D. (1859); 'Salvation from Sin' (1869); and 'History of American Socialism' (1870). See **PERFECTIONISTS**; **ONEIDA COMMUNITY**.

Noyes, William Albert, American chemist: b. near Independence, Iowa, 6 Nov. 1857. He was graduated from Iowa College in 1879, and in 1883-6 was professor of chemistry in the University of Tennessee, since when he has occupied the chair of chemistry at the Rose Polytechnic Institute at Terre Haute, Ind. He has edited the 'Journal of the American Chemical Society' since 1902, and is the author of: 'Organic Chemistry for the Laboratory' (1897); 'Organic Chemistry' (1903); etc.

Noyes, William Curtis, American lawyer: b. Schodack, N. Y., 19 Aug. 1805; d. New York 25 Dec. 1864. He was admitted to the bar in 1827, was appointed district-attorney of Oneida County, and later established a law practice in New York. He was one of the strongest advocates at the New York bar, and earned a reputation for highest integrity, and at the time of his death was engaged in codifying the laws of the State. He willed his extensive law library to Hamilton College, Clinton, N. Y.

Nu, *noo*, or *Nuu* (later form *Nun*), Egyptian deity. It was from *Nun*, the primeval flood, that *Re*, the sun-god, rose to his throne over the world. *Nun* was the personification of the original and eternal stuff or protoplasm from which gods and men were formed, but in a later age represented the life-giving waters of the Nile. Consult Wiedemann, 'Religion of the Ancient Egyptians' (1897).

Nuba, *noo'bā*, an ethnological name given to the negro tribes of Kordofan, in Eastern Sudan. The *Nubas* are true negroes. Consult Stanford, 'Africa' (1895).

Nubar Pasha, *noo'bār pāsh'ā*, Egyptian statesman: b. Smyrna January 1825; d. Paris 14 Jan. 1899. An Armenian Christian, he was educated in Switzerland and France, in 1842 became secretary to Boghos Bey, Egyptian minister of commerce and foreign affairs, later rose to be bey, and was sent on important diplomatic missions. Under Said Pasha he was in charge of the transport service through Egypt to India, and built the railway across the desert from Cairo to Suez. After the accession of Ismail Pasha, who at first strongly relied upon him, he was Egypt's first minister of public works, and from 1866 minister of foreign affairs. He successfully concluded at Constantinople and Paris the negotiations toward the construction of the Suez Canal, obtained for Ismail the title of Khedive, and strove to introduce European culture and methods of administration. At that time in Egypt the consulates of 17 various powers administered as many different codes of law, and to these courts alone the subjects of the said powers were amenable. Nubar prevailed upon the powers to allow the organization of international courts with a uniform code, perhaps his greatest achievement. He was dismissed in 1874, but on demand of the powers was at the head of the ministry in 1878-9, directing the financial reforms. In 1884-8 and 1894-5 he was again premier. He was very adaptable, not to say pliant, and readily became the administrator of a British policy of which he did not approve.

Nubia, *nū'bī-ā*, Africa, a comparatively modern name for a large region, formerly a portion of Ethiopia, and extending on both sides of the Nile from Egypt to Abyssinia; touching the Red Sea on the east and the desert on the west. Nubia proper, or Lower Nubia, extends from Assuan on the Egyptian frontier to Dongola, beyond that is Upper Nubia. But of late the name of Egyptian Sudan, properly applicable to a section of Upper Nubia, has come to be used for Nubia in its widest sense, together with the once Egyptian territory actually in the Sudan, and the equatorial provinces. The great Nubian Desert lies east of the Nile, opposite the great west bend of the river. See **EGYPT**; **SUDAN**.

Nuble, *noo'blā*, Chile, an inland province; bounded on the north by Linares, on the east by Argentina, on the south and west by Concepcion; area, 3,556 square miles. It is an agricultural region in which the chief product is wheat, and considerable attention is given to raising cattle. Capital, Chillan.

Nucleoprotein, products of the compounding of nuclein with proteids. They are compounded in varying proportion, but nearly all cell-nuclei contain them. On digestion with gastric juice an insoluble residue of nuclein is left by nucleoproteids.

Nuddea, *nūd'dē-ā*. See **NADIA**.

Nudibranchia'ta, one of the two primary divisions (orders or sub-orders) of the opisthobranchiate gastropods. The name is in allusion to the absence of the primary gills or ctenidia, which in mollusks occur typically within the mantle cavity, and the functional substitution for them of external processes or cerata which perforate the mantle when the latter is present. The cerata differ greatly in form and arrangement, and their peculiarities characterize the dif-

ferent families. They may be retractile or not; armed with stinging cells or without them; simple, pronged or arborescently branched, in the latter case usually penetrated by portions of the complexly ramifying liver. In their arrangement they may form dorsal or lateral rows, or a circle about the anus. Frequently they are most beautifully colored, and in many cases closely resemble the object on which the animal lives. The young are provided with a nautiloid shell, which is lost early in life, leaving the adult devoid of this protection. A mantle may or may not persist, and the integuments are frequently filled with calcareous spicules. On the head are found a pair of minute sessile eyes, and a pair of often retractile tentacles, which are olfactory in function and are known as rhinophores; in addition to which there may be a second pair of tactile tentacles. The mouth is provided with a radula and sometimes with jaws. Because of the usually elongated form of the body and their strictly marine habit, the nudibranchs are known popularly as "sea-slugs." With the exception of a few free-swimming, pelagic, and parasitic forms, the vast majority of the species belong to the littoral zone, where they creep upon algae, hydroids, polyzoans, and similar organisms, which afford them concealment and a place to attach the gelatinous capsules in which the eggs are deposited, besides furnishing the animal or vegetable food on which the particular species subsists. Most, if not all, of them are hermaphrodites. Upward of 1,000 species have been described and arranged in 17 families. On the Atlantic coast of the United States 21 genera and 33 species occur in the region north of Cape Hatteras.

Nueces, nwá'sés, a river in Texas, has its rise in a ridge of low mountains in Edwards County, flows south into Dimmit County, then east, northeast, and southeast into Corpus Christi Bay. It formerly marked the boundary of the province of Texas in Mexico. It is about 400 miles long and navigable only a short distance from the Gulf.

Nueva Cáceres, nwá'vā kā'thā-rēs, Philippines, formerly Naga, a pueblo and capital of the province of Ambos Camarines, situated in the southern part of the province on the Naga River at the head of navigation for large vessels, 10 miles inland from San Miguel Bay. It is a port of entry and an important road centre, and has an excellent trade. It is well built, contains a government house, a cathedral and episcopal palace, a seminary, hospital, parochial school, and a normal school for girls. It was at one time the seat of the episcopal see of the Philippines. Pop. 11,550.

Nueva Ecija, s'thē-hah, Philippines, a province of central Luzon, having a coast line of 23 miles on the Pacific, and bounded on the north by Pangasinán and Nueva Vizcaya, and on the south by Infanta and Bulacán. The surface is mostly low, but is broken in the northeast and south by foothills of the Cordilleras; the Grande de La Pampanga River crosses the province from north to south, the Canarén tributary of the Agno follows the northwestern boundary, the Pampanga Chico, the southwestern; many smaller rivers are tributary to these. The soil is very fertile, the larger rivers frequently overflowing and fertilizing the fields with their deposits. Rice is raised in the

southern and central portions; other important products are corn, tobacco, sugar, and papay. The chief industry is agriculture; there are some manufactures for home consumption only; sugar is in some cases manufactured and refined on the sugar plantations. Cattle are raised in the central part of the province. A road parallels the entire course of the Grande de la Pampanga River; there are numerous other roads, and a large boat traffic along the Pampanga and its tributaries. Civil government was established in Nueva Ecija in June 1901, and at the end of that year the governor reported that the province was "free from insurrectionary movement." Pop. 156,610, mostly Tagalogs.

Nueva Esparta, ās-pār'tā, Venezuela, a state composed of islands off the northwest coast of the republic. Margarita is the largest island of the group. Nueva Esparta was a part of the state of Guzmán Blanco until 1901, when it became a separate state.

Nueva Leon, lā-ōn' ("New Leon"), Mexico, a state in the northeastern part, bordering on the United States; area, 23,592 square miles. It is crossed by low mountain ranges, but has many fertile valleys, in which the chief products are cotton, rice, and fruits. The chief minerals which are mined are gold, silver, salt, and lead. The capital is Monterrey (q.v.). Pop. about 330,000.

Nueva San Salvador, sāl-sāl-vā-dōr', Salvador, Central America, city in a mountainous region a little northwest of the centre of Salvador. The chief occupation is mining. Pop. about 13,000. See SALVADOR.

Nueva Vizcaya, vēth-kā'yā, Philippines, a province of the island of Luzon, situated south of the centre of Northern Luzon, bounded on the east by the province of Isabela, and on the west by Pangasinán and Benguet; area, 1,075 square miles. The surface of the province is uneven, being broken by the foothills of the Sierra Madre, the Cordillera Central and the Caraballo range. The Magat tributary of the Grande de Cagayán River crosses the province from northwest to southeast, and there are numerous smaller rivers and streams. The only crop raised to any extent is rice; sugar, chocolate, and tobacco are also raised, but not in sufficient quantities to supply the inhabitants of the province. Several kinds of building stones, granite, sandstone, etc., are found in the mountains, but quarried only to a small extent, there are also valuable forests containing resin and gum trees, but these products are not gathered on account of the difficulty of transportation. A few simple fabrics are woven for domestic use. The main highway of Luzon from Manila to Aparri passes through this province, but there is but little traffic on account of the difficulty of reaching the interior. Civil government was established for the province in January 1902; and a special form of municipal government organized for a few of the larger towns, which is to be extended to other towns when they are prepared for it. Pop. 60,630, mostly non-Christian tribes.

Nuevitas, nwá-vē'tās, Cuba, seaport in the province of Puerto Principe, in the northeast part of the province, on the coast, and on the railroad which extends 39 miles to Puerto Principe (q.v.). It has an excellent harbor and a large trade with other seaports of Cuba, the

NUEVO LAREDO — NULLIFICATION

West Indies, and the United States. Pop. about 7,000.

Nuevo Laredo, nuwá'vô H-rá'dô, Mexico, town in the state of Nuevo Leon; on the Rio Grande, and on the Mexican National Railroad. It is opposite Laredo, Texas, and about 160 miles north by west of Monterey. Pop. 2,500.

Nuisance, in law, a term used to denote whatever is a serious annoyance to one's neighbors, or in a general sense to the public at large, in the exercise of their rights of property. Nuisances are of two kinds—public or common, and private. Public nuisances are: Annoyances in the highways, bridges, and public rivers, by rendering the same difficult or dangerous to pass, either by actual obstructions or by want of repair; injurious and offensive trades and manufactures, which, when hurtful to individuals, are actionable, and when detrimental to public health or convenience, punishable by public prosecution, and subject to fine according to the nature of the offense; keeping hogs in a city; disorderly houses, unlicensed plays, gaming houses, and brothels; lotteries; making and selling fireworks in unlicensed places. The storing of petroleum is also strictly regulated. Suffering any mischievous dog to go loose, to the danger of neighbors or passengers, is an indictable offense, and an action for damages will also lie against the owner; but it will not lie unless the owner has had notice of the dog having bitten somebody at least once before. In general, the owner of any vicious animal seems bound to secure it at all events, and is liable for damages to a party subsequently injured if the mode he has adopted to secure it proves to be insufficient. A private nuisance may be defined as an injury or annoyance to the person or property of an individual. If a person builds a house so near to that of his neighbor that the roof of the new building overhangs that of the other, and throws the water on it, this is a private nuisance, for which an action will lie. And if a house is built so near that it will obstruct the light and windows of another, the owner of the new house subjects himself to an action. But depriving one of a mere matter of pleasure—as of a fine prospect, this, as it abridges nothing really necessary or convenient, is not an injury for which there is legal remedy. To keep hogs near one's house, or to carry on any offensive trade—as a tanner, tallow-melter, soap-boiler, or the like—are all nuisances for which an individual has remedy by action. So also is it a nuisance if life be made uncomfortable by the apprehension of danger, or by employing a steam engine, which produces a continual noise and vibration in the apartments of a neighbor. Besides the remedy by action, injured parties may, in a clear case, take the law into their own hands, and remove or abate the nuisance, but it is never advisable to take this course. In all municipal codes there are elaborate provisions with reference to sewers and drains, the disposal of sewage, scavenging and cleansing water supply, cellar dwellings, and lodging houses, the prevention, abatement, etc., of nuisances, offensive trades, unsound meat, infectious diseases, and hospitals, mortuaries, highways and streets, lighting of streets, public pleasure grounds, markets, and slaughter houses, police regulations, prosecution of offenses, alteration of areas, etc. The overcrowding of houses

may be stopped. Provisions are also made to prevent the spread of diseases in times of epidemics, and to prevent common lodging houses from being kept in an unclean state. The inspector of nuisances or the medical officer of health has at all times power to inspect any animal, carcass, meat, poultry, game, fish, fruit, vegetables, corn, bread, or flour, and if found unfit for food, or diseased or unsound, they may be carried away and destroyed, and the owner or dealer fined. The local authority may order house proprietors to provide proper water closets, to cleanse gutters and cesspools, and to remove any pool, ditch, drain, urinal, or privy injurious to health.

Nukha, noo'khâ, Russia, town in Transcaucasia, about 120 miles east by south of Tiflis and 150 miles northwest of Baku. It is near oil fields and is the industrial and commercial centre of a silk-producing region. The inhabitants are mostly Armenians and Russians. Pop. about 25,000.

Nukualofa, noo-koo-â-lô'fâ, Friendly Islands, the capital of Tonga, the largest island of the group. See FRIENDLY ISLANDS.

Nüll, nül, Edward van der, Austrian architect: b. Vienna 9 Jan. 1812; d. there 3 April 1868. He was professor of architecture and ornamentation in the Vienna Academy, and a prominent practicing architect. Most of his designs were executed with August von Siccardenburg. These include the Lariach palace and the Opera, at Vienna. Nüll's style was largely Renaissance, inclining to late Renaissance and rococo, and he exercised a decided influence on the architectural development of Vienna.

Nullification, in American history, a political doctrine first suggested in the Kentucky Resolutions of 1798. Its fundamental principle was accepted by the Hartford Convention of 1814, but it was not until 1832 that the theory was fully developed by the master mind of Calhoun, and acted on by South Carolina in its famous Nullification Ordinance of 24 November of that year. The Federal Constitution recognized both the Union and the States as bearers of power, but did not clearly apportion it between them, nor clearly determine in cases of disputed claims which was the final arbiter. The nation possessed only delegated authority, while to the States remained the residuary powers. Calhoun in elaborating this doctrine claimed that historically the States came into being first, and were the creators of the Union, the grantors of power to their agent, the Federal government. It followed, therefore, as a natural consequence, that the final judge of the amount of power granted could not lie with the created—the agent—but must remain with the States as the creator. Also at this point the question arose in regard to the remedy should the agent of the States exceed the authority delegated, and pass laws that were contrary to the reserved rights of the partners in the Union. The fundamental basis then of nullification as Calhoun developed it was State Sovereignty (q.v.); and, in cases where the Nation was encroaching on the reserved rights of the States, he found in nullification a peaceable remedy. Secession and revolution were thus to be made unnecessary. The Union was as perfect after as before nullification. All rights and duties of the States and the Union remained unchanged except in regard to

the one nullified and therefore void law. Should any of the co-States desire to test the matter a constitutional convention might be called, and the question be settled by process of amending the constitution; but till overruled in this way the law was void in the nullifying State.

The cause of nullification is bound up in a compound of the protective tariff and sectional slavery. The former offered the immediate occasion for its promulgation, while the conditions that made protection popular in one section, and hated in the other, were found in the latter. As late as 1816 the South was not radically opposed to a protective tariff. But under the slave system manufactures and commerce did not develop. The South therefore could not profit by the protective system, and gradually developed a strong opposition to its continuance. By 1828, under the teaching of President Thos. Cooper, of the University of South Carolina, public opinion in that State had come to hold that the producer and not the consumer paid the tariff duty. It was also noted that about three fourths in value of all exports from the United States consisted of the products of the South, cotton, rice, tobacco, etc. Therefore, in harmony with Cooper's teaching, the South paid approximately three fourths of the government revenues derived from imported goods. Hence the demand for lower duties grew apace. But instead of lower rates the tariffs of 1824 and 1828 raised them. The tariff of 1828—"the tariff of abominations"—aroused Calhoun to seek a remedy. In that year he set forth his nullification theory tentatively, but did not press for action under it. By 1832 the National debt having been extinguished, the South at once began to demand a lower tariff, insisting that the extinction of the public debt removed all excuse for the longer continuance of high duties—of protection. Instead, however, of revising the tariff in 1832 in such a way as to reduce it to a revenue standard, the duties in the new law were placed on a protective basis, and that principle affirmed to be adopted as a permanent one. In South Carolina, for some years, a struggle between the nullifiers and the anti-nullifiers to control the legislature had been in progress. The tariff act of 1832 for the first time gave the necessary two thirds majority to the nullifiers, and on 24 Oct. 1832 the senate by a vote of 30 to 13, and the house by 99 to 25 resolved to call a convention to meet 19 November. On 24 November the convention voted 136 to 26 to declare the tariff acts of 1828 and 1832 null and void, because beyond the powers delegated to the United States. The convention also authorized the legislature to pass all laws necessary to enforce the ordinance of nullification. Laws were accordingly passed to prevent the collection of the tariff within the State, to give to the governor the power to call out the State militia, and to give the State courts full control of all cases involved under the tariff laws.

President Jackson in his annual message of December 1832 barely noticed this nullification action, but in his celebrated Proclamation of 10 Dec. 1832 he discussed the subject in all its aspects. He denied the possibility of nullification being a peaceable remedy. He asserted the National as opposed to the States Rights interpretation of the Constitution, and concluded with an earnest plea for the Union. He appealed to the

people of South Carolina not to be misled, not to be deceived into thinking that their action could end short of war and treason. He pictured their fate and the fate of the Union should they persist in their policy. In the meantime Congress had taken the matter into consideration. The great Webster-Hayne debate of 1830 had awakened the people to a realization of the issue. Now in February 1833 Calhoun and Webster were pitted against each other in the Senate of the United States, in the greatest constitutional discussion concerning the nature of the Union and the powers of the States that had ever occurred in the American Congress. Webster supported Jackson in his national views, while Calhoun reaffirmed the constitutionality of nullification, as a peaceable remedy, against the usurpation of power by Congress. Webster presented the Supreme Court as the final arbiter in disputed cases. Calhoun claimed that this would be making the agent the judge of his own powers—an impossible principle. The request of the President that he be granted increased powers was now met by the introduction of the so-called Force bill 21 January. The bill, however, made no progress until the introduction of Clay's Compromise Tariff bill 12 February. The two measures then moved forward with equal step. The one gave the President power to collect the revenues in South Carolina, using the whole power of the government for the purpose, if necessary; the other provided for a gradual reduction of the tariff duties, until by 1842 no duty should exceed 20 per cent, a revenue basis. The two measures reached the President at practically the same time—he signed them both 2 March 1833, and on 16 March South Carolina repealed her ordinance of secession. Both parties could thus claim a victory, the administration and its friends, as well as Clay, in that the protective tariff still existed; the nullifiers in the fact that provision was made to reduce the tariff to a revenue basis, thus in fact yielding to South Carolina, at the very moment of adopting the Force bill.

Nullification as a constitutional and peaceful remedy against oppression was never again asserted, but the basis of the theory—the doctrine that the States were sovereign—was not abandoned. In fact it was advocated even more strenuously than before. Instead of nullification in the Union, as a remedy, the doctrine of secession—a separation from the Union—gradually became the accepted principle of the States Rights school of statesmen. The advocates of the latter view held that to nullify a law and remain a member of the Nation was absurd; but affirmed that in case of a breach in the compact to withdraw from the Union was a constitutional right that flowed naturally from the character of the Union. H. W. CALDWELL,
University of Nebraska.

Nullipore, a name given to certain more or less massive sea-weeds of the family Rhodo-

Physca, common on rocky shores in warm climates, and especially about coral islands, where they serve to protect the corals somewhat against the beating of the waves. From secreting lime on their surface, and hence resembling coral, they were formerly supposed to be a kind of zoophytes. Some small species occur on the northern Atlantic coasts.

Numa Pompilius, nū'ma pom-plī'ŭs, 2d king of Rome, belonging to the legendary period of Roman annals. According to ancient accounts he was from Cures, in the land of the Sabines, and was distinguished for wisdom and piety. He was elected king after the year's interregnum following the death of Romulus. His lengthy and quiet reign he devoted to the adequate establishment of religion; and to him the Romans ascribed their whole system of worship. He also founded the temple of Janus, which during his rule remained closed. The sacred books of Numa, containing the prescribed manner of observance for the rites and ceremonies of religion, were said to have been entombed, and to have been discovered in 181 B.C. This story is now regarded as a forgery.

Numantia, nū-mān'shī-ā, Spain, an ancient town, situated on the Douro, near the place now called Soria in Old Castile. It is famous for its resistance to the Roman power. While the neighboring places yielded to the Romance the Numantians were firm in refusing submission. Large forces under the prætor Pompeius Aulus (137 B.C.) and the consul Hostilius Mancinus were repulsed. Scipio Africanus, the younger, with an army of 60,000 was sent to subdue them. He surrounded the town and famine compelled them to yield after a siege of 14 months. The conqueror destroyed the town, 133 B.C.

Numbering Machine, in printing, a machine for impressing consecutive numbers on account or record books, coupons, railway certificates, bank-notes, railway tickets, etc. The invention is that of Blaise Pascal (1650), and consists of disks or wheels decimally numbered on their peripheries, the whole mounted on one axle upon which they turn freely, acting upon each other in serial order. The first wheel of the series containing the units is moved one figure between each impact, and when the units are exhausted the tens come into action, and act in coincidence with the units, which continue their action.

Numbers, Book of, the fourth book of the Pentateuch, named in the Hebrew Bible 'The Wilderness,' from a word which appears in the first verse. The English title is a rendering of the Septuagint designation, which refers to the "numberings" of the people narrated in chapter i. 26. As the book opens at Sinai, like Leviticus, so it contains a continuation of the enactments given in that book. It is also connected with Deuteronomy, which takes up the narrative at the plains of Moab, the point in the people's wanderings at which Numbers ends.

Contents of Numbers.—The book may be divided into three parts, each of which places the scene of its incidents in a different locality. (1) The scene is Sinai in the first part. The desert march is to begin by a numbering of the people. A separate census of the Levites is taken, as also of the first-born males. This is followed by regulations for the lepers' banishment from the camp; the law of restitution; the

"waters of jealousy"; the law of the Nazarite; the form of priestly blessing. The offerings made by the princes at the dedication of the tabernacle are then enumerated. The Levites are set apart for their sacred office; the Passover observed by all ceremonially fitted for the observance; the guidance of the pillar of cloud described. (2) The second part relates the incidents of the journey from Sinai to the plains of Moab, and extends from the 2d to the 40th year after the Exodus. It is made up of the following disjected episodes: the murmurings at Taberah and Kibroth-hataavah; the institution of the seventy elders; the spying out of the land; the revolt of Miriam and Aaron; the consequent leprosy of Miriam; the stoning of the sabbath-breaker; the judgment of Korah and his company; the enactment of certain ceremonial laws. These events took place at Kadesh. The narrative proceeds with the journey from Kadesh to Edom, relating the victories over Sihon and Og and from Edom to the plains of Moab, relating the death of Miriam; the faithfulness of Moses and Aaron at Meribah; the death of Aaron at Mount Hor; and the visitation of fiery serpents. (3) The third part narrates the incidents that occurred in the plains of Moab; Balaam's prophecy; the idolatry at Shittim; the second numbering of the people; the appointment of Joshua to succeed Moses; the partition of the Promised Land; appointment of Levitical cities and cities of refuge; encounter with the Midianites.

Literary Characteristics.—These recall Exodus in its chronological dislocation and mixture of narrative and legislation. The Book of Numbers contains some remarkable fragments of old Hebrew poetry. It is brief in comparison with the length of time covered, there being little record of about thirty-eight years spent in the wilderness. The beginning of the narrative is a pretty full account of the first fourteen months of the journey, this completeness of detail is again resumed in the record of the closing year.

Numbers, Theory of, in its elementary part, is that branch of mathematics which deals with the properties of integers. The scope of the whole subject can best be indicated after an explanation of the idea of a *modular system* of numbers, which is fundamental in it. An adequate treatment of certain problems relating to integers requires that the system of integers (including zero) under consideration be enlarged by the introduction of certain other numbers, and that the system, so enlarged, shall retain the fundamental properties of the original system. The latter is such that it contains the difference (and hence the sum) of any two of its numbers, and this property is selected as fundamental. A system of numbers which has this property is called a modular system; it always contains (1) the number zero, (2) the negative of each of its numbers, (3) an infinite (see ASSEMBLAGES, GENERAL THEORY OF) number of numbers. In general it is possible to select a certain set of numbers of the system, called the basis of the system, as say, m_1, m_2, \dots, m_n , called the elements of the basis, and to express

NUMBERS, THEORY OF

every number of the system in the form $x_1m_1 + x_2m_2 + \dots + x_nm_n$, where the x 's are integers. The theory of numbers is the study of certain modular systems.

DIVISIBILITY OF INTEGERS.

The set of integers, which is a very simple modular system having one element, unity, in its basis, has the additional property that it contains the product of every two of its numbers: and two large classes of relations of integers are called *additive* and *multiplicative* since they depend mainly upon ideas of addition and multiplication respectively. The introductory part of the subject deals mainly with the latter relations. For the sake of brevity there will be assumed from Arithmetic and Algebra (see ALGEBRA) the commutative and associative laws for addition, the commutative, associative and distributive laws for multiplication, the meanings of divisor, or factor, common divisor, greatest common divisor (G. C. D.), multiple, common multiple, least common multiple (L. C. M.), [a] , function, and the processes for finding the G. C. D. and L. C. M. of two integers.

Factorization of Numbers.—An important and at times an exceedingly difficult problem is that of finding all divisors of a number. Certain numbers have no divisors except themselves and unity. These are called *prime*. (Two numbers which have no common divisor except unity are called *relatively prime*.) All divisors of a number may easily be found if all of its prime divisors are determined, but no satisfactory method has been devised for such determination. Nevertheless certain principles are clearly understood.

Consider now one modular system consisting of all positive and negative multiples of an integer a , and another consisting of all such multiples of another integer b . It may be shown that (1) *the set of numbers consisting of all of the numbers of these two systems and also of the sums of all pairs of them is a modular system consisting of the positive and negative multiples of d , the G. C. D. of a and b* . For if any two integers of the first system be ax_1 , ax_2 , and if any two of the second system be by_1 , by_2 , then any two of the third system can be represented by $ax_1 + by_1$ and $ax_2 + by_2$. The difference of these, $a(x_1 - x_2) + b(y_1 - y_2)$, is in the third system, since it is the sum of $a(x_1 - x_2)$ and $b(y_1 - y_2)$, which are in the first and second systems, respectively. The third system is, then, a modular system, and consists of all multiples of its smallest number, n , say. Since a and b are in the third system, n must be a common divisor of a and b . But every number of the system, being of the form $ax + by$, is divisible by d . Hence $n = d$.

As an example, let $a = 6$, $b = 8$, whence $d = 2$. The three systems are respectively
 $\dots, -24, -18, -12, -6, 0, 6, 12, 18, 24, \dots$
 $\dots, -32, -24, -16, -8, 0, 8, 16, 24, 32, \dots$
 $\dots, -8, -6, -4, -2, 0, 2, 4, 6, 8, \dots$

Corollary (2). *If two integers a , b , have their G. C. D. equal to d , there exist integers x , y , such that $ax + by = d$. (This is true even if $d = 1$.)*

Example 1. $a = 6$, $b = 8$, $d = 2$; $6 \cdot 3 + 8(-2) = 2$.

Example 2. $a = 5$, $b = 6$, $d = 1$; $5 \cdot 5 + 6(-4) = 1$.

The following result is used repeatedly in later arguments:

Theorem (3). *If of three numbers a , b , c , two of them, a and b , are relatively prime, then every common divisor of ac and b is a common divisor of b and c . For let ac and b have a common divisor d . Since a and b are relatively prime there exist numbers x and y , such that $ax + by = 1$. Then $acx + bcy = c$. But d is a divisor of acx and bcy , and hence of c . It is therefore a common divisor of b and c .*

Corollary (4). *If a and b , and also b and c , are relatively prime, so are ac and b .*

A theorem of fundamental importance in relation to the factorization of numbers may now be proved.

Theorem (5). *A positive integer can, in one and only one way, be represented as a product of prime factors.*

If possible, let an integer n be expressed by two different products of prime factors, $p_1 p_2 \dots p_k$ and $q_1 q_2 \dots q_l$, where in each case the order of the factors is such that a smaller factor never follows a larger. Then $p_1 p_2 \dots p_k = q_1 q_2 \dots q_l$. If any factor, as p_1 , were not present in the second product it could not be a divisor of that product, nor of n (see 4). A continuation of this argument yields a *reductio ad absurdum*.

For large numbers the problem of factorization is very difficult, but for small ones it is comparatively easy. For since the smallest prime factor of a number n , not itself a prime, cannot exceed \sqrt{n} , it is necessary to test only prime factors up to \sqrt{n} .

Distribution of Primes.—The proof that the number of primes is infinite was given by Euclid, and is singularly brief. The assumption that there is a largest prime, p , is shown to be incorrect by the consideration of the number $1 + p$, which, not being divisible by any number less than $(p + 1)$, must either be divisible by a prime greater than p or be a prime itself.

The law of distribution of primes has been carefully studied, but the investigations cannot be presented here, the law being a very obscure one. Two special results are of some interest. It has been shown that between any number $n (> 1)$ and its double, $2n$, there is at least one prime, and also that any number, m , of consecutive numbers can be found, no one of which will be prime.

Number and Sum of Divisors of a Number.

—If the number 55125 be expressed by means of its prime factors the result is $3^2 5^4 7^1$. Now every divisor of this number must be a product of powers of 3, 5, and 7. In fact, all of these divisors are terms in the expansion of the product $(1 + 3 + 3^2)(1 + 5 + 5^2 + 5^3 + 5^4)(1 + 7 + 7^2)$. This expansion contains $(2 + 1)(3 + 1)(2 + 1) = 36$ terms. Hence the number of divisors of 55125 is 36. Again, the product mentioned is equal to the sum of these 36 divisors.

Also $(1 + 3 + 3^2) = \frac{3^3 - 1}{3 - 1}$ (see ALGEBRA, Geometrical Progression). Hence the sum of all divisors of 55125 is $\frac{3^3 - 1}{3 - 1} \cdot \frac{5^5 - 1}{5 - 1} \cdot \frac{7^2 - 1}{7 - 1}$. In

general, if $n = p_1^{a_1} p_2^{a_2} \dots p_k^{a_k}$, the p 's being

primes, (6) the number of divisors of n is $(a_1 + 1)(a_2 + 1) \dots (a_k + 1)$, and (7) their sum is

$$\frac{p_1^{a_1+1} - 1}{p_1 - 1} + \frac{p_2^{a_2+1} - 1}{p_2 - 1} + \dots + \frac{p_k^{a_k+1} - 1}{p_k - 1}.$$

Number of Numbers less than a Given Number and Relatively Prime to It.—The number $10125 = 3^4 5^3$. The numbers less than 10125 and relatively prime to it are those which are not divisible by 3 or by 5. From the first 10125 numbers all multiples of 3, and all multiples of 5, should be omitted. There are $\frac{1}{3} \times 10125$ multiples of 3, and $\frac{1}{5} \times 10125$ multiples of 5, but some of these, the $\frac{1}{15} \times 10125$ multiples of 15, are multiples of both 3 and 5. Hence the number of numbers relatively prime to and less than 10125 is $(10125 - \frac{1}{3} \times 10125 - \frac{1}{5} \times 10125 + \frac{1}{15} \times 10125) = 10125(1 - \frac{1}{3} - \frac{1}{5} + \frac{1}{15})$, since the multiples of 15 should not be

removed twice. In general, if $n = p_1^{a_1} p_2^{a_2} \dots p_k^{a_k}$ it may be shown that (8) the corresponding number, which is always denoted by $\phi(n)$, is $n(1 - \frac{1}{p_1})(1 - \frac{1}{p_2}) \dots (1 - \frac{1}{p_k})$. For example

$\phi(7) = 6$, $\phi(10) = 4$, $\phi(p) = (p - 1)$. This important function $\phi(n)$ has the notable properties: (1) If n and n_1 are relatively prime $\phi(nn_1) = \phi(n)\phi(n_1)$; (2) If d_1, d_2, d_3, \dots are all of the divisors of n , $\phi(d_1) + \phi(d_2) + \phi(d_3) + \dots = n$.

THEORY OF CONGRUENCES.

Consider the modular system consisting of all positive and negative multiples of a positive integer m . Then any integer either is in this system or differs from a number of it by a number r , less than m . Hence every integer is expressible in the form $mq + r$. Integers may then be divided into m classes, all those in any class having the same remainder when divided by m . Then the difference between two numbers of the same class is divisible by m , and these two numbers are said to be *congruent with respect to the modulus* m . If n_1 and n_2 are in the same class, this relation is written $n_1 \equiv n_2 \pmod{m}$, a notation which is due to Gauss. The statement is called a *congruence*. Thus the modulus being 3, the numbers 7 and 16 belong to the same class, since each gives the remainder 1 when divided by 3. Then $7 \equiv 16 \pmod{3}$, or in other words, the difference between 7 and 16 is a multiple of 3.

The following are fundamental properties of congruences, the modulus, when omitted, being m :

- (6) If $a \equiv b$, and $a \equiv c$, then $b \equiv c$.
 If $a \equiv b$, and $c \equiv d$, then $a + c \equiv b + d$, and $ac \equiv bd$.
 If $a \equiv b$, then $ca \equiv cb$.
 If $ca \equiv cb$, and if d is the G. C. D. of c and m , then $a \equiv b \pmod{\frac{m}{d}}$.

Between the methods used and the results obtained in the theory of congruences and the methods and results in the apparently unrelated field of the theory of equations (see EQUATIONS, GENERAL THEORY OF), there is a parallel so striking that one acquainted with the latter can promptly select, and even solve, a great many

of the most important problems relating to the former. Thus congruences may state relations between known quantities only, or between known and unknown quantities, in the latter case suggesting the problem of finding possible values of the unknown quantities. Congruences of the latter sort may be classified either according to the number of the unknown quantities or according to the degrees of the expressions with respect to these unknown quantities. Thus if $f(x, y, z, \dots)$ is an algebraic expression containing several unknown numbers x, y, z, \dots , as well as known numbers, the standard problem is: *To determine integral values for x, y, z, \dots such that the congruence $f(x, y, z, \dots) \equiv 0 \pmod{m}$, shall be true.* A set of values of the sort required constitutes a *solution* of the congruence. If there is only one unknown number in the congruence, any value of that number for which the congruence is true is called a *root* of the congruence. Two roots which are congruent are regarded as the same root.

Consider now congruences which contain only one unknown number x , and in particular, congruences of the form $f(x) = a_0 x^n + a_1 x^{n-1} + \dots + a_n \equiv 0 \pmod{m}$ where a_0, a_1, \dots, a_n are integers, a_0 being relatively prime to m . Then by methods parallel to those of the theory of equations it may be proved that when the *modulus* is prime (1) the congruence has not more than n different roots; (2) if r is any integer, the remainder free from x obtained when $f(x)$ is divided by $(x - r)$ is congruent to $f(r) \pmod{m}$; (3) if r is a root of the given congruence, the remainder obtained by dividing $f(x)$ by $(x - r)$ is congruent to zero \pmod{m} .

Linear Congruences.—The general congruence of the first degree in x , namely, $ax + a_1 \equiv 0 \pmod{m}$, a_1 being relatively prime to m , has just one root. For of the m numbers $a_0, 2a_0, 3a_0, \dots, (m-1)a_0, ma_0$, no two differ by a multiple of m (see 9). Hence just one of them belongs to each of the m classes of numbers. If ka_0 and $-a_1$ belong to the same class, then $\{ka_0 - (-a_1)\}$ or $ka_0 + a_1$ is a multiple of m . Hence $ax + a_1 \equiv 0 \pmod{m}$; and k is a root of the congruence.

Corollary: The congruence $ax \equiv 1 \pmod{m}$ (a relatively prime to m) has just one root, a^{-1} , say.

In this case the numbers a_0, a_1 are called *associate* numbers.

If in the congruence $ax + a_1 \equiv 0 \pmod{m}$, a_0 and m have as G. C. D. the number d , the congruence has no roots unless a_1 is divisible by d , in which case it has d of them. For suppose that $a_0 = a'_0 d$, $a_1 = a'_1 d$, $m = m' d$. Then if

$$ax + a_1 \text{ is divisible by } m, \frac{a_0 x + a_1}{d} \text{ or } a'_0 x + a'_1$$

is divisible by m' , and conversely. But the congruence $a'_0 x + a'_1 \equiv 0 \pmod{m'}$ is of the sort considered just above, and the numbers which satisfy it are all congruent $\pmod{m'}$. It has then only one root, say k , $\pmod{m'}$. All numbers which satisfy the latter congruence are roots of the former, but they are not all congruent \pmod{m} . On the contrary, with respect to the modulus m , there are d distinct sets, and the original congruence has d roots $k, k + m', k + 2m', \dots, k + m'(d-1)$.

NUMBERS, THEORY OF

The last result furnishes an interesting example of the failure of the parallel between the theory of congruences and the theory of equations. Of these there are not a few. They generally occur when the modulus is not prime. Another interesting example is the possibility of solving several simultaneous congruences in one unknown quantity, the moduli of the congruences being different.

Theorems of Fermat and Wilson.—Before discussing the various classes of congruences of higher orders it is convenient to exhibit two of the most interesting results of the whole subject. They are the theorems of Fermat and Wilson.

FERMAT'S THEOREM. *If p is any prime number, and a any number less than p and greater than zero, then $a^{p-1} \equiv 1 \pmod{p}$.*

Consider the set of numbers $a, 2a, 3a, \dots, (p-1)a$. No two of them are congruent \pmod{p} . Hence they are congruent to different ones of the numbers $1, 2, 3, \dots, (p-1)$, though not necessarily in this order. The product of the first set is congruent to the product of the second set, whence $a^{p-1} \cdot (p-1)! \equiv (p-1)! \pmod{p}$. Then $a^{p-1} \equiv 1 \pmod{p}$ since $(p-1)!$ is relatively prime to p (see §9).

The statement of Wilson's theorem is: *If p is any prime number, $(p-1)! \equiv -1 \pmod{p}$.*

Both of these theorems have been so generalized as to apply to the case in which the modulus is not prime.

Fermat's theorem furnishes another instance of the failure of the parallel between the theory of numbers and the theory of equations. For from it we see that the congruence $x^p \equiv x \pmod{p}$ is satisfied by every number of the system of integers.

Congruences of Higher Orders.—The general quadratic congruence may be written $a_n x^2 + a_1 x + a_0 \equiv 0 \pmod{m}$. Its solution may be reduced to the solutions of a linear congruence and of a binomial congruence of the form $x^2 \equiv a \pmod{m}$. In connection with this congruence the important questions are: (1) What relation must exist between a and m in order that the congruence may be solvable? and (2) What are the roots of a congruence of this sort which is known to be solvable? According as the congruence is or is not solvable, a is said to be a *quadratic residue* or a *quadratic non-residue* of m .

In regard to the first question it may be noted that if $(x^2 - a)$ is divisible by m , it is divisible by every prime factor, p , of m . Hence if the congruence is solvable a must be a *quadratic residue of every prime factor of m* . It may also be proven that the product of two numbers is a quadratic residue if each number is a residue, or if each is a non-residue, but that the product is a non-residue if only one is a residue. Hence it is possible to determine whether a is a residue of m if one finds whether each prime factor of a is a residue of each prime factor of m . This procedure raises three distinct questions, for a may have as factors, $-1, 2$, or odd primes. It is easy to show that, p being a prime factor of m , (1) -1 is a quadratic residue of all primes of the form $4n+1$ (e. g. 13, 17, 29), but a non-residue of all primes of the form $(4n+3)$ (e. g. 23); and (2) 2 is a residue of all primes of the form $(8n+1)$ or $(8n-1)$ (e. g. 17, 23), but a non-residue of all primes of the form $(8n+3)$ or $(8n-3)$ (e. g. 11, 29).

To determine whether a given odd prime, p , is a quadratic residue of another odd prime q , use is made of the famous Reciprocity Theorem, first proven by Gauss. This theorem states that if, of two odd primes p and q , one is of the form $(4n+1)$ then each is a quadratic residue of the other, or each is a non-residue of the other; while if both primes are of the form $(4n+3)$, one is a residue or non-residue of the other according as the other is a non-residue or residue of the one. This theorem is the most celebrated one in the theory of numbers; it has been proven in a great variety of ways, Gauss himself having contributed seven distinct proofs. The application of this result and of the two preceding ones is greatly facilitated by the use of what is known as Legendre's Symbol.

Legendre's Symbol.—It is found that according as a number a is or is not a quadratic residue of p , a certain function of a and p is congruent to $+1$ or $-1 \pmod{p}$. Legendre introduced the symbol $\left(\frac{a}{p}\right)$, defining it to be $+1$, or -1 , according as a is or is not a quadratic residue of p . The three results stated may be written symbolically:

$$(1) \left(\frac{-1}{p}\right) = (-1)^{\frac{p-1}{2}}; \quad (2) \left(\frac{2}{p}\right) = (-1)^{\frac{p^2-1}{8}};$$

$$(3) \left(\frac{p}{q}\right) \cdot \left(\frac{q}{p}\right) = (-1)^{\frac{p-1}{2} \cdot \frac{q-1}{2}}.$$

The use of the third result may be illustrated by taking $p=13, q=3$. Then $\left(\frac{13}{3}\right) \cdot \left(\frac{3}{13}\right) = +1$.

But two congruent numbers are both residues or both non-residues. Hence, since $13 \equiv 1 \pmod{3}$,

$$3) \left(\frac{13}{3}\right) = \left(\frac{1}{3}\right). \text{ Moreover } 1 \text{ is a quadratic residue of every number. Hence } \left(\frac{1}{3}\right) = +1;$$

and so $\left(\frac{3}{13}\right) = +1$. Accordingly 3 is a quadratic residue of 13.

The difficulties of solving a binomial quadratic congruence which is known to be solvable are relatively slight, and the question will not be considered here.

The theory of congruence of degrees higher than the second is far from complete. Considerable attention has been given to binomial congruences of the form $a_n x^n + a_0 \equiv 0 \pmod{m}$. Gauss found that he could not properly state the reciprocity-theorem for the case $n=4$, without making a study of the modular system of numbers of the form $a + b\sqrt{-1}$, a and b being integers. His results have been generalized and much more general modular systems have been studied. An account of these cannot be given here.

Other Branches of the Subject.—The theory of congruences belongs to the multiplicative part of the subject. Another notable branch is the theory of forms, which is essentially additive. In it the standard problem is "Given an expression $f(x, y, z, \dots)$ in which all of the numbers are integers, to determine whether by a choice

NUMERALS

of integral values for certain unknown quantities the expression can be made to assume a specified integral value.³ Thus in the case of the quadratic form $ax^2 + bxy + cy^2$, the problem is to find whether a specified integer m can be broken up into three integral parts of the form ax^2 , bxy , and cy^2 , and to determine in how many essentially different ways this can be done. The study of the classification of quadratic forms alone requires the use of infinite series (see SERIES) and of other agencies which at first sight seem to be entirely unrelated to the theory of integers. The theory of forms has been studied principally in connection with forms of the second order in any number of unknown quantities x, y, z, \dots , and forms of the second and third orders in two unknown quantities. One other branch, also of an additive nature, is the theory of partitions of numbers, the partitions of a number being the different ways of expressing it as a sum of a given number of integers. Thus the partitions of 7 into 4 integers are $1+1+1+4$, $1+1+2+3$, $1+2+2+2$. The treatment of this subject also requires the aid of the higher Analysis.

Historical Sketch.—Historically, the development of the Theory of Numbers falls into two well-defined periods, whose point of division is the year 1801. Until late in the first period the subject was not recognized as constituting a distinct branch of mathematics. The publication in 1801 of Gauss' famous 'Disquisitiones Arithmeticae' firmly established the subject as such a branch, and since that event its development has been rapid and uninterrupted.

Probably the earliest investigators in this subject were Pythagoras (580?-500? B.C.) and his followers, who were familiar with the ideas of odd and even numbers, factors and multiples and primes. By the time of Euclid (about 300 B.C.) the subject included the idea of perfect numbers, that is, those which are equal to the sum of their divisors less than themselves, and of common divisors, the process for finding G.C.D., the proof that the number of primes is infinite. Diophantos (246?-330? A.D.) studied methods of finding rational solutions of indeterminate equations. His work inspired some of the best of the later writers of the first period, among them Bachet de Méziriac (1581-1638 A.D.) and Fermat (1601-55 A.D.), who edited his works. Fermat contributed several very notable results, though without proof. Among them are the theorem already mentioned in the preceding text and the theorem that no integral solutions exist for the equation $x^n + y^n = z^n$, if n is an integer > 2 . Euler (1707-1803 A.D.) proved this last theorem for $n=3$ and 4, generalized the former theorem, studied the function $\phi(n)$, stated the reciprocity-theorem, and initiated the study of quadratic forms. The work of Lagrange (1736-1813 A.D.) and Legendre (1752-1833 A.D.) on quadratic forms closes the first period.

In the work which opened the second period Gauss (1777-1855) systematized the subject in much the same way as that in which Euclid brought order into the subject of geometry. He treated thoroughly the elementary theory of congruences, residues (quadratic and higher), quadratic forms, and founded the modern theory of modular systems by the study of the system of numbers $a + b\sqrt{-1}$, a and b being integers.

Of the many workers since Gauss' time it will suffice to mention Dirichlet, who simplified some of Gauss' methods, and made important contributions by the use of infinite series; Kummer, Dedekind, and Kronecker, who considered general modular systems; and Eisenstein, Smith, Hermite, Sylvester, and Minkowski, who contributed largely to the theory of forms.

G. H. LING,

Instructor in Mathematics, Columbia University,
New York City.

Numerals (from Latin *numeralis*, from *numerus*, number). In mathematics the word is commonly used to designate characters which represent numbers, as in speaking of the Roman numerals. In very ancient times there were approximately as many systems of numerals as there were languages, and particularly with the higher numerals there were often quite radical modifications from century to century. The numerals most generally used by the mathematicians of classical times were the Greek; of mediæval times, the Roman; of modern times, the Hindu or Arabic. Of these, the first two were but little used in actual computation, the abacus (q.v.) answering for this purpose.

The primitive Greeks, like other early peoples, had little use for large numbers, and so they used separate marks like scores (A. S. *sceræ*, to cut, whence *shears*, and *to shore* up a building by a piece of cut timber) or tallies (Fr. *tailleur*, to cut, whence *tailor*) on a stick. Even as late as 351 B.C., an inscription at Tralles, in Caria, has ||||| for seven. This plan seems to have been followed by a primitive alphabetic system, the letters being taken in their natural order. A for 1, B for 2, Γ for 3, Δ for 4, and so on until the alphabet was exhausted. For monumental purposes, however, the initial letters of important number words came early into use. These letters were I (either as a primitive single stroke, or from *Ια*, for *μία*), II (*ἑξήκοντα*, five), Δ (*δέκα*, ten), Η (*ἑκατόν*, the Η being the old breathing, replaced by ' in *ἑκατόν*, hundred), Χ (*χίλια*, thousand), and Μ (*μύρια*, ten thousand), together with various ligatures of these letters. These numerals were, in mediæval times, called Herodian, from Herodiansus, a grammarian who flourished in the 2d century A.D., who described them. The final form, which generally replaced the Herodian numerals in the 4th century A.D., was alphabetic. It consisted of the accented letters of the alphabet, with three obsolete ones added to bring the number to 27. Of these, the first nine represented the units 1-9, the second nine the tens 10-90, and the third nine the hundreds 100-900. The thousands were represented by the same letters differently accented, although M , Mu , M or aM was generally used for 10,000, M or pM for 20,000, and so on.

The Roman numerals were partly derived, through the Etruscans, from certain Greek letters not adopted in the Italian alphabets. In

particular, Θ , after passing through various modifications, became C , the final form being, of course, influenced by the word *centum*. The letter Φ was adopted for 1,000, and half of it for 500, so that until quite recently CD has been printed for M , and D for D . If the symbol be rapidly written it may be made to resemble ∞ , a form not uncommon in the Middle Ages, or the cursive M , and this final form, as in the case of C , was determined by a numeral word, *mille*. The primitive form of the Greek χ , quite different from the later X , was adopted arbitrarily for 50, and it is easy to trace, in monumental inscriptions, its transition to the L . As to the use of X for 10 and its half, V or A for 5, there is no generally accepted origin, although there have been many ingenious conjectures. In writing large numbers there was great diversity of method, owing to the fact that they were little used in operations, the words being written in full to indicate results. The use of a bar over a numeral to indicate its multiplication by 1,000 was occasionally seen, as in Pliny, but it was not common for the reason that the bar was frequently used to distinguish a numeral from a word. A method which found considerable favor was that of using CCD for 1,000, CCDD for 10,000, CCCCDD for 100,000, and so on, with D , DD , DDD , for 500, 5,000, and 50,000. In the later Middle Ages, forms like vjf , ixM , MM , iiijM , and Mcccciiij , for 600, 9,000, 1,000,000, 3,000, and 1,500 were common. The idea that a character could never be used more than three times in succession is a creation of recent text-book makers, as the use of IIII instead of IV on clock-faces shows. The number 1900 was formerly written MDCCCC , although MCM has become common in the present century.

The Arabic or Hindu numerals 1, 2, 3, now in common use, are cursive forms from the primitive symbols — , = , ≡ . The numerals 4, 5, 6, 7, 8, 9 seem to have been Bactrian letters arbitrarily adopted in northwestern India as number signs, just as the Etruscans adopted the Greek Θ , Φ , and X . The system first appears in an inscription of the 3d century B.C., in a cave at Nānā Ghāt, in the Bombay presidency. The name *zero* is from the Sanskrit *śunya*, void, through the Arabic *sifr* and the late Greek *νίλημ*. It appears in Fibonacci (q.v.) as *sephyra*, whence *sephiro*, *sefro*, *zero*, and the French *chiffre*, whence the early Dutch *cijfer* and our *cipher*. The symbol, without which the most essential feature, the place value, of our system is wanting, may have been used in the 6th century A.D., although the earliest known document containing it is an Indian grant of 738. The date of the introduction of the system into Christian Europe is in dispute. The numerals were known to Gerbert (Pope Sylvester II., q.v.) about 1000 A.D., and they may have been known to Boethius (q.v.) 500 years earlier. The Moors in Spain knew them under the name *gobar* (dust), in allusion to their representation upon the dustboard (see *ABACUS*). The first Christian writer fully to appreciate them was Fibonacci (q.v.), who made them known in Italy in 1202 A.D. It was not, however, until after the invention of printing (c. 1450) that their great value could be made widely known. Their extensive use may be said to have begun in Italy in the latter part of the 15th century.

The first printed arithmetic naturally appeared in the centre of the world's commerce of that period, northern Italy (Treviso 1478), and it used these numerals exclusively. In Germany, however, the Hindu characters had not entirely replaced the Roman when the first arithmetics were printed, and hence one of the most popular writers of the first quarter of the 16th century, Kōbel, makes extensive use of the latter. Indeed, so familiar had these characters become to the common people of Germany in the 15th century that they were often called German ("Teutsche") numerals, and this name was common as late as 1550. The commercial interests of France not demanding many arithmetics early in the 16th century, the Roman numerals never appeared prominently in their printed books. In England, the Roman numerals played but a small part in the practical text-books, although for college and church accounts they were used until the 17th century. (See *ARITHMETIC, HISTORY OF*)

The following are some of the forms which the Hindu-Arabic numerals have taken in their evolution from the Bactrian alphabet:

DAVID EUGENE SMITH,
Professor of Mathematics, Teachers College,
Columbia University, New York.

Numeration, the art of expressing in characters any number proposed in words. The chief terms used for this purpose are the names of the digits from one to ten, a hundred, a thousand, a million, etc. The term billion is of uncertain use: in Britain it is a million of millions; in France, America, etc., a thousand millions.

Numerical Aperture, a term used in optics; the method by which the illuminating and resolving power of high-power microscopic objectives is calculated. Since it became customary to interpose water, oil, or other fluid between the object and the lens, it is found that a water immersion lens of $97\frac{1}{2}^\circ$, and an oil immersion of 82° , give equal results to a dry or air lens of 180° . This obviously depends on the diameter of the back lens of the objective, and this on the refractive index of the medium between lens and object. It is expressed by the formula, $n \sin u$, where n is the refractive index of the medium — air or fluid — and u the semi-angle of aperture. It is thus found that an oil-lens of 180° has a numerical aperture of 1.52 against 1.00 for 180° in air. This only repre-

NUMERICAL NOTATION—NUMISMATICS

sents the comparative diameters of the effective pencils, and the relative illumination is, of course, obtained by squaring the numerical apertures to get the comparative areas of the pencils. We thus find that an oil-lens of 180° gives 2.310 the illumination of a dry objective of 180° .

Numerical Notation, in music, a modern system of indicating single tones or entire chords by means of numerals. The system is especially used in indicating the range of various instruments. Roman numerals are used in violin music and Arabic figures in compositions. The system was first introduced by G. Weber. See **MUSIC; TONES**.

Numidia, nū-mīd'ya, Africa, the ancient Roman name for the region now corresponding roughly with modern Algeria. It was divided among various tribes, but after the second Punic war it was united under Masinissa, and several of its rulers became noted in Roman history, more especially Jugurtha. In 46 a.c. it became a Roman province. Under the Roman emperors Numidia attained a high degree of prosperity, and Christianity was in a flourishing condition here. It was afterward conquered by the Vandals, later by the Arabs, and in modern times by the French.

Numismatic and Archaeological Society, The American. See **AMERICAN NUMISMATIC AND ARCHAEOLOGICAL SOCIETY**.

Numismatics, the science which treats of coins and coinage and the authorized government issue of money from the archaeological, historical, artistic and economic viewpoint. The word is derived from the Greek *nomisma*, through the form sometimes found in Latin, *numisma*, signifying coin. The name of coins is given to the pieces of metal on which the public authority has impressed different marks to indicate their weight and value, to make them a convenient medium of exchange. The study of coins is regarded as indispensable to archaeology, and to a thorough acquaintance with the fine arts. They indicate the names of provinces and cities, determine their position, and present pictures of many celebrated places. It is from coins that we derive all our knowledge of some of the most celebrated works of ancient art, particularly of ancient statuary. Coins likewise fix the period of events, determine sometimes their character, and enable us to trace the series of kings. They enable us to learn the different metallurgical processes, the different alloys, the mode of gilding and plating practised by the ancients, the metals which they used, their weights and measures, their different modes of reckoning, the names and titles of the various magistrates and princes, and also their portraits; the different divinities, with their attributes and titles, the utensils and the ceremonies of their worship.

Design and Form.—The parts of a coin are the two sides. (1) The obverse side, face, or head which contains a portrait of the person at whose command or in whose honor it was struck, or other figures relating to him. This portrait consists either of the head alone or the bust, or of a half or full length figure. (2) The reverse contains mythological, allegorical, or other figures. The words around the border form the legend; those in the middle the inscription. The lower part of the coin, which

is separated by a line from the figures or the inscription, is the basis, and contains subsidiary matter, as the date, the place where the piece was struck and other data. In ancient as in modern times, while the coins of empires or kingdoms were distinguished by the head of the reigning prince, those of republics and free states were distinguished by some symbol, and sometimes these symbols are found along with the head of a reigning prince. These symbols were sometimes chosen on account of an accidental similarity between the name of the symbol and that of the state. Thus, a rose was the symbol of Rhodes; a heart that of Cardia; a pomegranate that of Pamphylia. More frequently, however, the symbols had some local reference. Thus, Egypt was distinguished by a sistrum, an ibis, a crocodile, or a hippopotamus; Arabia by a camel; Africa by an elephant; Athens by an owl; Crete by a labyrinth, and Syracuse and Corinth by a winged horse. In shape most coins are circular, although some have been oblong-oval, octagon, and even square. Coins are usually of gold, silver or copper, and occasionally of brass, white metal, nickel, tin, lead or bronze. More rarely an alloy of gold and silver, or an alloy of silver and tin, were used. There were also coins made with the main body of copper, but with a thin covering of gold or silver, either laid on the form of a thin plate, or by dipping the coin in the molten metal.

Numismatic Science—The study of coins appears to have been entirely unknown to the ancients. It does not appear from any ancient works that any value was set upon coins as curiosities by the collectors of works of art in the times of Augustus, though there were at that time series of coins of cities, some of which have come down to us, and attract attention on account of their antiquity and the beauty of their execution. In the 15th and 16th centuries kings and queens, and private individuals of wealth and culture, particularly in Italy, France and Germany, rivaled each other in zeal for collecting these remains of antiquity, at first principally with a view of obtaining portraits of the chief characters of Roman history. Learned treatises soon succeeded these first collections, in which the chief attention had been paid to striking impressions. The earliest treatises were those of the Italian Enea Vico and the Spaniard Antonio Agostino, both published in the 16th century. In the 17th and 18th centuries, the investigations into the mixtures of metals and the execution of the dies; the form, size, weight, value, and number of the ancient coins, their genuineness or spuriousness, became susceptible of more certainty by the accumulation of materials of comparison; and the understanding of the types and legends was also facilitated by similar means. The coins of the Middle Ages have been sought for with zeal, and along with the ancient coins have been made to throw light upon subjects which manuscripts and writers left unexplained. The literature of numismatics has now become very extensive, but much of it is comprised in periodicals and pamphlets. From a numismatic standpoint, the value of a coin depends largely upon its condition. There are 11 classes, namely: Proof, Uncirculated, Circulated Very Fine, Fine, Very Good, Good, Very Fair, Fair, Poor and Very Poor. Proofs are those coins struck for

collectors and not designed for general circulation. They have a polished mirror-like surface and bring the highest prices when offered for sale. Uncirculated coins are strictly unused, being in the same condition as when first issued from the mint, showing no sign of the least rubbing or wear. Circulated coins are those which have been in circulation barely long enough to wear off the mint lustre without rubbing the metal. The size of coins is reckoned by numismatists in the United States in sixteenths of an inch.

Ancient History.—We have no accurate knowledge of the beginning of coinage. Abraham returned from Egypt nearly 2,000 years before Christ "very rich in cattle, in silver and in gold"; and in his purchase of the cave of Machpelah he weighed out the consideration agreed upon, "400 shekels of silver, current money with the merchant." The use of metals, however, in the form of wedges or bars, though a great advancement upon simple barter, or the use of grain, cattle or other commodities, was still attended with inconveniences. "At every transaction the precise weight of metal must be computed; a hammer and chisel must be at hand to cut it off and a balance to weigh it. The fineness of the metal was also to be ascertained." The method of shaping the metal into pieces of convenient size and stamping upon each its exact value ended all these troubles. He who first did this was the inventor of coins; but history is silent respecting his name, his country or the date of his invention. Homer speaks of the workers in metals but makes no mention of coined money. Herodotus says that the invention was Asiatic and that as far as he knew, the Lydians were the first who struck money, and although the oldest coins now extant have usually been supposed to be Grecian, there are reasons for thinking that the invention was Asiatic. Bricks of clay were a primitive coin employed by China, Arabia and Siam before copper money came into general use. Clay was mixed with glue, stamped with a stamp, after having been made into small bricks. Egypt in ancient days made money of several substances. Parchment, leather, pasteboard, wood, covered with wax, and papyrus were employed. They also used scarabei, which were stone and pieces of clay molded into the shape of beetles and tortoises. This was 2,800 years before Christ. Unless marked by authority they passed only at their commercial value; if marked, their value was enhanced.

Greek and Roman.—The coins of Greece and Asia Minor are the earliest known to the numismatist. The coins of the kings of Macedonia are the most ancient bearing portraits; and Alexander I., who commenced his reign about 500 years before Christ, is the earliest monarch whose coins have yet been found. Then succeed the sovereigns who reigned in Sicily, Caria, Cyprus, Heraclea, and Pontus. Afterward comes the series of kings of Egypt, Syria, the Cimmerian Bosphorus, Thrace, Parthia, Armenia, Damascus, Cappadocia, Paphlagonia, Pergamos, Galatia, Cilicia, Sparta, Pæonia, Epirus, Illyricum, Gaul, and the Alps. This series reaches from the era of Alexander the Great to the Christian era, comprising a period of about 330 years. A perfect and distinct series is formed by the Roman emperors, from Julius Cæsar to the overthrow of the

empire by the Goths. The Roman coins may be resolved into three great divisions, those of the older republic, the consular, and imperial. The consular coins seldom or never bore the names or titles of consuls till toward the close of the republic; nevertheless they are not improperly called consular, because they were struck in the consular times of Rome. These have also been denominated "coins of families," and are arranged according to the names inscribed on them. The brass consular coins are rather uninteresting and few. The imperial coins were those struck after the conclusion of the republican era of Rome down to the fall of the Roman Empire. Some of these coins are artistic; but they are for the most part rude and uninteresting. The materials of which they were composed were, as in modern times, gold, silver and the various modifications of copper.

The Middle Ages.—The money of the Byzantine Empire forms a link between ancient and modern coinage. The gold solidus or nomisma was circulated in the west as well as the east of Europe. Then came the silver piece or penny. The Scottish copper coinage, which was of an earlier date than that of England, was preceded by money of bullion, called black money, consisting of copper washed with silver. There are many coins of William I. in 1165; and a large hoard of his pennies was found in 1780. The only silver coin was the penny until the year 1203, when Alexander III. coined also half pence; and there are silver farthings of Robert I. and David II. The groat and half-groat were also introduced by the latter. These all ceased to be coined in the time of Queen Mary, when shillings were first coined, with the bust of the queen on one side and the arms of France and Scotland on the other. The silver crown was first coined in 1565. At the union of the kingdoms all the Scottish coins were called in and recoined at Edinburgh. In France the earliest coins are those of the Merovingian kings. In the 13th century gold coins were issued. In Italy appeared the gold florins of Florence, and in Germany coins of the emperors, the electors and the smaller princes. The coins of Spain began with the Gothic princes. The Hungarian began in the 11th century and the Russian in the 14th. The coinage of Norway and Sweden at first resembled the British type and afterward the German.

Oriental.—In India the first coins of the Hindu princes are of the 7th century. Iron coins were minted in China as early as 2454 B.C., and in 14 A.D. a new kind of iron money was coined. These pieces were called yik-tseu, meaning "banded round and surrounded with

Chinese Cash.

red," on account of the raised edge of the coin, which was made of red copper. An imperial mint was established, and the officers of the

NUMISMATICS

Sanglin (Academy of Science) were appointed mint masters. The pieces of 5 tsu were then issued, remaining the principal money in circulation for 800 years. After this came a new issue. The coins were circular with a square hole in the centre, in accordance with the Chinese belief that the "heavens are round and the earth square." This coin was called "kai-guen-t'ling-pao," remaining until the present day. Upon the obverse the inscription reads: "Current money of the newest beginning," and in the exergue the date of the year of the emperor's reign. The principal gold coin was called "kin," a pound of gold.

American Colonial Coinage.—The earliest American coins were executed in 1612, for the Virginia Company, at the Sommer Islands, now called Bermudas. The coin was of brass, and bore on the obverse the words, "Sommer islands," and a "hogge on one side, in memory of the abundance of hogges which were found on their first landing." On the reverse was a ship under sail, firing a gun. The earliest Colonial coins were made in Massachusetts in 1652, when a "mint howse" was established at Boston and coins of the value of threepence, sixpence, and twelpence were struck. These

New England Sixpence.

coins were to be of the fineness of "new sterling English money," and every shilling was "to weigh a threepenny troy weight, and lesser pieces proportionately." They were soon after in circulation, but owing to the excessive plainness of their finish they were found to be greatly exposed to "washing and clipping." To remedy this, in the same year "henceforth both shillings and smaller pieces shall have a double ring on either side, with the inscription (Massachusetts) and a tree in the centre, on the one side, and New England and the date of the year on the other side." In 1662 a twopenny piece was added to the series. These coins are now known as the "pine tree shillings," etc. The Massachu-

Pine Tree Shilling.

setts mint existed about 34 years, but all the coins issued bear only the dates 1652 and 1662, the same dies being used probably throughout that period. In the reign of William and Mary copper coins were struck in England for New England and Carolina, having on the obverse an elephant, and the reverse respectively, "God preserve New England, 1694," and "God pre-

serve Carolina and the lord proprietors, 1694." In Vermont a mint was established by legislative authority in 1785, in the town of Rupert, and copper cents were issued of the following description: obverse, a sun rising from behind hills and plow in the foreground—legend, *Vermontensium Res Publica*, 1786; reverse, a radiated eye surrounded by 13 stars—legend, *Quarta Decima Stella*. Connecticut followed the example of Vermont, and in the same year, 1785, authorized the establishment of a mint at New Haven, and copper coins were issued weighing six pennyweights, and having on the obverse a head with the words *Auctori Connect.*; reverse, a female figure holding an olive branch. New Jersey authorized a copper coinage in 1786. The coins were inscribed: obverse, a horse's head with a plow beneath—legend, *Nova Cæsarea*, 1786, etc.; reverse, a shield—legend, *E Pluribus Unum*. Various other coins and tokens were issued by the Colonies.

United States Coins.—In the first Constitution of the United States, which was submitted to the States about 1787 for their ratification, it is provided that Congress shall have power "To coin money, and regulate the value thereof." The first Congress which held its session in 1789 was so busy in carrying out the designs of the Constitution in the formation of a Federal Government, that little time or attention could be given to the subject of coinage. About this time a foreigner of the name of John Mitchell proposed to coin coppers for our government. The matter was referred to Mr. Jefferson, then secretary of state, who reported against it. On 15 April 1790, Congress instructed Alexander Hamilton, then secretary of the treasury, to prepare a plan for the establishment of a mint. A long report was made by Mr. Hamilton, in which he proposed the coinage of the following pieces: A gold piece equal in weight and value to 10 dollars; a gold piece equal to a tenth part of the former, this piece to be a dollar; a silver piece which shall also be a dollar; a silver piece which in weight and value shall be the tenth part of a dollar; a copper piece which shall be of the value of the hundredth part of a dollar; a copper piece which shall be half the value of the former. The report was sent to Congress in January 1791, and 2 April 1792 the law "Establishing a Mint and regulating the coins of the United States" was approved by President Washington. The officers to be employed as provided by the Act were, a Director, an Assayer, a Chief Coiner, an Engraver and a Treasurer. The Act also provided that the coins to be struck should be:

Gold.—The eagle, of 10 dollars, to weigh 270 grains; the half and quarter in proportion, all to be of 22 carats fineness.

Silver.—The dollar of 100 cents, to weigh 416 grains, the half, quarter, dime and half-dime to weigh in proportion, the fineness to be 1485 parts in 1654, or 892.4 thousandths.

Copper.—The cent to weigh 264 grains and the half cent in proportion.

The President proceeded at once to carry out the provisions of the Act and Philadelphia was selected for the erection of the mint. The foundation stone of the mint was laid on 31 July 1792. In September the building was so far completed that some of the machinery was put in and on 11 September six pounds of copper was purchased at 1s. 3d. per pound. Three

NUMITOR—NUNEZ DE ARCE

presses for coining which were imported arrived during September and in the beginning of October they were first used in striking half dimes. All of the pieces struck during this year were classed as pattern pieces, the regular coinage not beginning until the next year, when the Chief Coiner reported on 1 March that 11,178 cents had been struck. The first deposit of gold bullion received at the mint for coinage was in February 1795. Moses Brown, of Boston, Mass., made the deposit which consisted of ingots to the value of \$2,276.22. The Chief Coiner reported the first return of gold coins on 31 July 1795. It consisted of 544 half eagles. Nine deliveries of this same coin were reported during the year. The first eagles delivered was on 22 Sept. 1795, the delivery consisting of 400 pieces. During the 19th century various experiments were made in the value of the American coins, and half cents, three-cent pieces, two-cent pieces and 20-cent pieces were issued and discontinued. In 1903, the coins in circulation were: dollars, half dollars, quarter dollars and ten-cent pieces of silver; five-cent pieces of nickel and silver alloy, and one cent in copper and bronze. See **COIN**; **COINAGE**; **MINT**; **MEDAL**; **TOKENS**.

Editorial Staff, 'Encyclopedia Americana.'

Numitor, nū'mī-tōr. See **ROMULUS**.

Num'mulite, a genus of *Foraminifera*, mainly extinct, which forms vitreo-calcareous, many-chambered shells having much the form of a doubly convex lens, which when flattened by pressure as in fossil examples, led to their being likened to little coins (*nummuli*). They varied in size from that of a pinhead to that of a silver dollar. The group originated in the Carboniferous, increased, and flourished at its maximum during the early part of the Tertiary period, when these foraminifers swarmed in the seas in incredible abundance. Their shells constitute the bulk of the Eocene Nummulitic Sandstone of the Old World, where it is one of the most important, if not the principal formation of the Tertiary series of rocks, in point of extent. Attaining a thickness of many thousands of feet, it ranges from the Alps and Atlas to the Carpathian Mountains; appears in Egypt, Asia Minor, Persia, and can be traced through India and China into Japan. The pyramids of Egypt are built in greater part of this nummulitic limestone. Consult Geikie, 'Text-book of Geology' (1882), and the writings of Lyell, Prestwich and other geologists.

NUN. See **MONASTICISM**; **SISTERHOODS**.

Nun of Kenmare. See **CUSACK, MARY FRANCES**.

Nun of Kent. See **BARTON, ELIZABETH**.

Nunc Dimittis, nunk dī-mī'tīs, the first two words of the Latin version of the Song of Simeon (Luke ii, 29, 33), 'Lord now lettest thou thy servant depart in peace,' etc. It was anciently used in the Vespers or Compline services of the Eastern and Western Churches, and is found in the Book of Common Prayer as part of the evening service.

Nuncio, nūn'shī-ō, a papal commissioner who permanently represents the Pope abroad, and corresponds to the secular ambassador at a foreign court. A papal commissioner who is sent on a temporary mission is styled a legate and, if a cardinal, is styled a legate, *a latere*, that is, sent immediately from the side of the pontiff. Previously to the Council of Trent the papal nuncios acted as judges in the first instance of matters which lay within ecclesiastical jurisdiction; since that time they have been formed into a kind of court of appeal from the decisions of the respective bishops.

Nun'comar. See **HASTINGS, WARREN**.

Nuneaton, nūn-ē'tōn, England, a town of Warwickshire, on the Anker, 17 miles north-east of the town of Warwick. It has two churches, a free grammar and several other schools. Cotton and woolen manufacturing is carried on to some extent. By the amalgamation of Chilvers Coton, a suburb, in the last decade of the 19th century, the population increased from (1891) 11,580 to 26,000 in 1910.

Núñez, Pedro de Villavicencio, Spanish painter: b. Seville 1635; d. there 1700. He was of noble birth and early became a pupil of Murillo (q.v.) and one of the best Spanish painters of the Seville School which Murillo preeminently represented. At Malta, where he resided as one of the Knights of the Order of Saint John of Jerusalem, he studied under Mattia Preti (q.v.), called "Calabrese." Returning to Seville he lived on the closest terms of intimacy with Murillo who expired in his arms. After the death of his great teacher he went to Madrid and there produced the picture, 'Beggars Playing Dice,' which is altogether in the best style of Murillo. This work he presented to Charles II., king of Spain. 'Scenes from the Life of the Virgin' he executed for the Carmelite Convent at Seville, while his fine likeness of Archbishop Spinola at Seville gives a good idea of his power and style as a portrait painter.

Núñez, noo'nās, Rafael, Colombian statesman: b. Cartagena 28 Sept. 1825; d. there 18 Sept. 1894. After holding posts in the Colombian cabinet and consular service, he was elected governor of the state of Bolívar, and president of Colombia in 1879, 1883 and 1891. He was also a journalist, editing the 'Porvenir' in Colombia and 'El Continental' in New York, and published several volumes of prose and verse.

Núñez de Arce, noo'nāth dā ār'thā, Don Gaspar, Spanish poet: b. Valladolid 6 Aug. 1834. He studied at the University of Toledo, became a deputy in 1865, a member of the Academy in 1876, and minister for colonial affairs in 1882. Subsequently he became a senator and president of the Society of Spanish

NUNEZ DE BALBOA—NUREMBERG

writers. His lyric verse won for him the title of the "Tennyson of Spain." Among his works are 'Gritos del Combate' (5th ed. 1885), poems of the revolution; 'La Selva Oscura' (15th ed. 1886); 'La Vision de Fray Martin' (15th ed. 1886, on Martin Luther), translated into German by Fastenrath ('Luther im Spiegel Spanischer Poesie,' 2d ed. 1881); 'Ultima Lamentacion de Lord Byron' (23d ed. 1884); 'El Vertigo,' 25th ed. (1886); 'La Pesca' (15th ed. 1886); and 'Maruja' (9th ed. 1886).

Núñez de Balboa. See BALBOA.

Núñez, Cabeza de Vaca, ká-bá'thā dā vā'ká, Alvar, Spanish explorer in America: b. Estremadura 1507; d. Seville 1564. In 1527 he sailed from Spain in the ill-fated expedition of Pánfilo de Narvaez for glory and plunder, but was captured by Indians and carried about by them in western Louisiana and eastern Texas. He was successful in trade, exchanging the shells and wampum of the coast for hides and other inland commodities. During his eight years' captivity he also gained considerable reputation as a sorcerer, and the reverence in which he was consequently held was undoubtedly an aid to his safety. He finally escaped, fell in with three other survivors of Narvaez' undertaking, ascended the Rio Grande, crossed Chihuahua and Sonora to the Gulf of California, and finally (May 1536) reached Culiacan. The pilgrimage was one of 2,000 miles, and involved every sort of vicissitude. One result of the journey was to reveal to Spanish knowledge a great territory north of Mexico and to lead to the strange quest for the seven cities of Cibola. A joint account of their travels, given by the travelers at Santo Domingo was printed in Oviedo's 'Historia General y Natural de Indias.' De Vaca was sent as administrator of La Plata in 1540, and was the earliest explorer of Paraguay. In 1544 he was arrested on the charge of lraia, a follower; sent to Spain; exiled to Africa; and in eight years pardoned. He published an account of his adventures in 1542. This appeared in an English version in 'Purchas his Pilgrimes' (1625); as well as in a translation by Smith (1857-71).

Nunivak, noo'ní-vák, Alaska, an island off the west coast, in the Bering Sea; separated from the mainland by the Btolin Strait, about 48 miles wide. It is about 55 miles long and 40 miles wide; area, about 1,200 square miles. It is fertile and well wooded on the west and south; the inhabitants are Eskimos. They have considerable trade in ivory, skins, and fish.

Nun's Priest's Tale, The, one of the stories in Chaucer's 'Canterbury Tales.' Its origin is a fable by Marie de France which was subsequently amplified in the 'Roman du Renart.' It relates the escape of Chanticleer from the jaws of the fox by inducing the latter to open his mouth for speech. Dryden modernizes the story in 'The Cock and the Fox.' In Æsop's Fables a similar narrative occurs.

Nuphar, a genus of yellow water-lilies, order *Nymphaeaceae*. See WATER-LILY.

Nur-and-Spell, an old English game, peculiar to the rural districts, played with a ball, which is "risen" from a trap and hit with a bat made for the purpose. The ball, called the "nur," is made of wood, a little bigger than a walnut. The bat, called a "triptick," as it is

also used to spring the trap or "spell," consists of a piece of hard wood, 6 by 4 inches, and 1 inch thick (the pommel), attached to a supple handle from 3 to 4 feet long, which the player grasps with both hands, giving the full swing of his body with the stroke. The game consists of the cumulative distance of a given number of strokes, the player who has the greatest number of yards being the winner.

Nur-Ed-din El-Betrufi, noor-ed-dên' èl-bè-troo'jè, Arabian astronomer: b. Morocco, 12th century. He was known also by the name of Alpetragius and was an authority upon astronomy in his day. He disproved Ptolemy's theory of the epicycle. See 'Alpetragii Arabis Planet. Theoriae phys. Rationibus Probata' (1537).

Nureddin - Mahmud, noo-rèd-dên' mām-mood', Malek al-Adel, sultan of Syria and Egypt, styled "Al Shahid," "the Martyr": b. Damascus 21 Feb. 1116; d. there 15 May 1174. He succeeded his father as emir of Aleppo in 1145 and repelled Jocelin de Courtenay's attack on Edessa. He held the armies of the second crusade (1147) at bay, and, after their departure, invaded Antioch and speedily wrested from the Christians all northern Syria, making Damascus his capital. The alliance of the Greeks and Franks against him came to nothing, and Nureddin extended his power to Egypt. But there his lieutenant Shirkuh was succeeded by the great Saladin (q.v.), who gradually made himself independent of his master. Nureddin was on his way to Egypt to punish Saladin when he died. He was highly praised by Christians and Mohammedans as a just, charitable and noble character.

Nuremberg, nù'rēm-bèrg, or **Nürnberg,** Germany, a city of Bavaria, in Middle Franconia, the second city in the kingdom, and once the greatest and most wealthy of all the free imperial cities of Germany, on the Pegnitz, 93 miles northwest of Munich. It is surrounded by an ancient wall flanked with towers and pierced with 10 gates, the whole enclosed by a dry ditch 100 feet wide and 50 feet deep; parts of these fortifications have been removed to make way for great extensions and improvements. The Pegnitz, traversing the town from east to west, divides it into two nearly equal parts—the north, or Sebaldersseite, and the south, or Lorenzseite, connected by numerous bridges. Notwithstanding modern improvements the city remains the quaintest and most interesting of Germany, owing to its many picturesque mediæval features. The Burg or royal palace, built (1024-1158) by Conrad II. and Frederick Barbarossa, commands a glorious view of the surrounding country, and is rich in paintings and wood-carvings. Among conspicuous public buildings the town-house, an Italian building of three stories, with a fine front, and a great hall, the walls of which are decorated with paintings in oil, many of them by Dürer. The Germanic National Museum, founded in 1852 in a suppressed Carthusian monastery, a Gothic building of the 14th century, with extensive cloisters, and since much extended by the addition of the rebuilt Augustinian monastery adjoining, now ranks among the first in Germany, and is exceedingly rich in works illustrative of the arts and industries of the Middle Ages. The most remarkable edifice is Saint Se-

NURHAG—NURSE

Sebal's Church, which gives its name to the north division of the town, a Gothic structure of great elegance externally and internally (its older parts dating from the 10th century), containing the shrine of Saint Sebal, a tomb in bronze by Peter Vischer, who, with his five sons, labored upon it for 13 years, and adorned it with nearly 100 figures, among which those of the apostles are conspicuous for size and beauty. Other buildings deserving of notice are the church of Saint Lorenz, containing a remarkable pyx by Adam Kraft, exquisitely sculptured in white stone, 64 feet in height. There are several public fountains, the chief being the Schöne Brunn, in the form of a graceful Gothic cross 63 feet high, adorned with figures. There are statues of Dürer, Hans Sachs, Melancthon, and others. There is also a monument of the war with France, erected in 1876. The town library contains 80,000 volumes, and educational institutions are numerous. Communication between the various parts of the town and with the suburbs is facilitated by electric tramways. Before the passage to the East Indies round the Cape of Good Hope was discovered Nuremberg was the great mart of the produce of the East coming from Italy and going to the North. The manufactures are still considerable, and again rapidly rising in importance. Among the most important at the present day are toys, lead-pencils, colors, chemicals, clocks and watches, brass and steel wares, playing cards, tobacco and cigars, railway-carriages, machinery, electrical apparatus, musical and scientific instruments, beer, etc. The toys made here and in the neighborhood go to all parts of the world. Printing, lithographic work, type-founding, and book-binding are also extensively carried on. There are schools for the training of mechanics; and there is a large industrial museum. The town is celebrated, in connection with its industry, for the invention of watches, wheel-locks (used in discharging old muskets), gauge-plates for drawing brass-wire, clarinets, and air-guns.

Nuremberg, though an ancient city, does not carry its origin so far back as Roman times. It had acquired considerable importance by the 10th or 11th centuries, and was frequently visited by the emperors of Germany. It was greatly enlarged by Conrad III., and received several embellishments and important privileges from Frederick Barbarossa. In 1219 it was raised to the rank of a free city of the empire. It early took part in the Reformation. Subsequently it suffered during the great European wars, and being repeatedly laid under contribution by both parties, became so exhausted that the sources of its prosperity were almost dried up, and the population rapidly decreased by extensive emigration. Having finally incurred a load of debt, which made it an acquisition of little value to any state, it was formally taken possession of in 1806 by Bavaria, which undertook the settlement of its debts, and, by judicious arrangements, has considerably increased its trade. Many distinguished individuals have been born here, among them the poet Hans Sachs, the painter Albert Dürer (whose house may still be seen), and the sculptors Peter Vischer and Adam Kraft.

Nurhag, ancient round towers on the island of Sardinia. They are about 50 feet high and about 30 feet in diameter, measured at

the base and outside of the platform on which the largest of them are founded. The materials are limestone, trachitic porphyry, granite, or volcanic rocks, obtained from neighboring quarries. Each block forms a cube about 3 feet each way, and its surface is an irregular line, such as the blows of the hammer in shaping it may be supposed to have made; the walls are without cement, within as well as without. A wall of 10 feet, built like the main structure, is surrounded by a parapet 3 feet high. The roof of each apartment is arched; the entrance terminates in a flat architrave, and is sometimes so high that a man can enter without stooping, and sometimes so small that he can only creep into it on his stomach, though it gets wider as he proceeds. Hence the low chambers are mere cells formed in the thickness of the wall, while the high chambers are supported by pillars. In the cells broken human bones mixed with earth, like that of ordinary graves, have been found. It is many centuries since these remarkable monuments attracted attention. The origin and aim of these structures is still, however, not free from doubt, though they are generally regarded as tombs, constructed so as to be available, in emergencies, for purposes of defense.

Nurse, Trained, is one who has followed a course of training in a school for nurses connected with large city hospitals, for two years or more, and who has received a diploma after a severe examination, and has been graduated. It was not until the early part of the 12th century that a so-called school for nurses was organized, by the Abbess Hildegard, among her friends and associates for service in the hospitals. From this small beginning grew the system of a special training for nursing, which, however, remained in its infancy until the middle of the 19th century. In 1840 there was an organization of nurses in London which cared for the sick poor, but it remained for Florence Nightingale to give the impetus to a movement toward securing a more efficient training for nurses. This movement Miss Nightingale started in 1853. In 1870 Miss Louise Lee Schuyler, who was the founder of the New York State Charities Aid Association, organized the Bellevue Training School for Female Nurses in New York city, and in 1872 the first class of trained nurses in this country was graduated from Bellevue Hospital. Now nearly every large hospital in the country has its training school.

The term of study, in most of the schools, is two years. In some of the small towns the course may be one year or 18 months, and in some schools three years is required. Application is made to the superintendent of the training school, and after a physical examination, the applicant is received on a two months' probation term. During this period the applicants receive board and lodging, but serve without pay, and education, strength, powers of observation and endurance are tested. If, after this probation, they prove acceptable to the superintendent, they are required to sign an agreement for the balance of the term, whereby they bind themselves to obey the regulations of the hospital and remain in the school until the term is ended. This agreement can be terminated for cause by either party. Pupils reside in the "home" connected with the hospital, wear a uni-

NURSE

form, while on duty, and receive board, lodging, laundry work and a small compensation, generally \$10 or \$12 a month. Lectures are given by the members of the staff of house physicians, the visiting physicians and surgeons, and head nurses. The lectures by the physicians cover anatomy, physiology, materia medica and all departments of medicine. The head nurses teach bandaging and the dressing of wounds. Obstetrics and the care of the insane are also taught. Massage is taught in a degree; but if a nurse wishes to take the full course, it requires a six month term in a regular massage school. A diet-kitchen, where proper food for the sick is prepared, is generally under the charge of one of the head nurses. The first three months are occupied by the pupils in a general observation of the work of the hospital ward's head nurse and the assistant nurse. The care of the beds of the patients is one of the first duties learned. Taking the pulse, temperature and respiration of a patient and making a record of it on a chart provided are the next steps. In the surgical wards the dressing of slight wounds is a part of the duties, and probably the pupil must assist in the care of the operating room and making ready the dressing to be used after operations have been performed. The pupil is then examined and, if the examination is satisfactory, advancement to assistant nurse follows. After three months more comes another examination, and at the end of a year, still another. The pupil then is a full fledged nurse and is placed in charge of a ward, and full responsibility for the condition of the patients is placed upon her. She must receive the new patients sent from the receiving ward, note their condition, and if she thinks it warranted, send for the house physician at once. Otherwise the patients wait until the regular call. She must go with the house physician, when he makes his visits to the bedside of each patient, carefully note his diagnosis of each case; make a memorandum of the medicines prescribed and see that the medicine is properly administered. She must note the least sign of change in the patient's condition, and, if for the worse, call the physician at once, or in extreme emergency, be ready to know what to do and do it at once. She must be extremely self-reliant and be ready to know how to act on the instant, as the life of the patient very often depends on quick action. After graduation she goes into private practice and must be prepared any hour, day or night, to respond to a call. The salary received varies from \$25 to \$50 a week, according to the severity of the case.

In December 1887, D. O. Mills of New York, after a visit to the city hospitals, decided that the number of infirm and sick men who were in the hospitals made it a necessity to educate male nurses, and he organized the Mills Training School for Male Nurses of Bellevue Hospital, put up a building on the Bellevue grounds and gave it to the City of New York to be used as a "Home" for the male training school. The first class of male nurses was graduated from Bellevue in 1890. The male training school idea was taken up by the physician in charge of the City Hospital, on Blackwell's Island, and the first class graduated from there in 1890, shortly after the Bellevue class. The training is the

same as in the female schools, the only difference being that greater attention is bestowed upon diseases of men. When the male nurse begins private practice his salary ranges from \$5 a day of 12 hours to \$10; and, in contagious or infectious diseases, to even more.

State registration of trained nurses is now a law in New York, Virginia, North Carolina and New Jersey. The Legislatures of these States passed bills in 1903 requiring trained nurses to register their names and addresses with the county clerk of their respective counties. In the State of New York registered nurses are entitled to use the abbreviation "R. N." after their names, and it is made a misdemeanor punishable by fine for any person not a trained nurse to use the abbreviation. Nothing, however, contained in the acts is considered as conferring any authority to practise medicine or to undertake the treatment and cure of diseases. Examinations are held under a commission of five members of the New York State Nurses' Association, appointed by the Regents of the University of the State of New York. They grant certificates which may be revoked for sufficient cause, after written notice to the holder, and no person is allowed to practise as a registered nurse after such certificate has been revoked. The law in the other States is virtually the same as in New York. The best known training schools are those connected with the Bellevue, Presbyterian, Mount Sinai and City Hospital in New York city; the Massachusetts General Hospital, in Boston; Philadelphia and Pennsylvania Hospitals in Philadelphia; Johns Hopkins Hospital in Baltimore and the Illinois Training School for Nurses, Chicago. The first class of young negro women ever graduated as trained nurses was sent from the Lincoln Hospital and Home, New York city, in December 1903.

The buildings of the New York City Training School for Nurses, of the City Hospital, Blackwell's Island, were dedicated 3 Dec. 1903. There are three buildings; the first named "Jones Hall," as a tribute to the services of Mrs. Cadwalader Jones, who has been the chairman of the advisory board of the school since its organization in 1875, and its reorganization on more distinctively educational lines in 1888 was directly due to her efforts. The building is a four-story structure 35 by 107. The first story contains a class room, drawing room, and two rooms for the isolation of contagious cases of sickness among the nurses and their cure. Each of the other three stories contains rooms for the accommodation of 18 nurses. The second building is named "Rice Hall," in honor of Mrs. William B. Rice, who is a member of the advisory board of the City Training School and of the Board of Managers of the Bellevue Training School. This building contains, on the first floor, the offices of the school, the chemical and bacteriological laboratories and a room for the classes in dietetics. The other three stories contain rooms for 16 nurses. The central building was christened "Schuyler Hall," in honor of Miss Louise Lee Schuyler, the founder of the Bellevue Training School for Nurses, and contains the kitchen, dining rooms and rooms for 20 nurses.

FRED H. ADAMS,

Staff of the New York City News Association

NURSE-FROG—NURSERY FOR CHILDREN

Nurse-frog, any of various frogs and tree-frogs which have or make special arrangements for the care of the eggs or young, or of both. The most widely known example is probably the European obstetrical frog (q.v.), the male of which takes charge of the eggs as soon as laid by the female, and carries them with him until they hatch. Many other species, especially among those living in the American tropics, take precautions as to their offspring. Thus one, the Brazilian ferreiro (*Hyla faber*) makes beneath the water in the ponds where it goes to spawn, small walled-in basins of mud, within which the spawn is deposited and the tadpoles are reared in safety from many enemies that would attack them were they running at large. Several kinds of frogs have their few eggs placed upon the back of the female, in pits or pouches in the skin, and keep them there until they hatch; and in one well known genus (*Phyllobates*) the tadpoles cling to the mother's back, and are carried about and cared for until able to transform and care for themselves. Consult Gadow, 'Amphibia and Reptiles' (1902). See FROG; MARSHAL FROG.

Nurse-shark, a name given by American fishermen to several different kinds of shark, as the Sleeper (*Somniosus microcephalus*), and especially a voracious tropical shark (*Ginglymostoma cirratum*) abundant about the coral reefs of the West Indies and the coast of Mexico, where it is called *gato*. The Port Jackson shark (*Cestrucion*) is sometimes called nurse-shark.

Nursery, in agriculture, a place where shrubs and trees are raised for transplanting or for sale. In America the term excludes florists' establishments and other places where herbaceous plants are grown, being restricted to places where woody plants are propagated, the division resulting from the earlier development here of the orchard and other fruit interests, and from the different kinds of equipment required by the two branches. There is apparent a further division of the nursery business proper into establishments for growing (a) ornamental, and (b) useful plants. The commercial history of this industry is confined to the 19th century, paralleling and fostering the development of the fruit industry, and extending westward and southward from western New York which has long been the centre of the business, with headquarters at Rochester. According to the census statistics of 1900, the industry represents a capital investment of \$52,500,000 in 4,500 nurseries, covering an acreage of 172,800 acres. To operate this area there were required 45,600 men, 2,279 women, 14,200 horses, mules, etc. Of the 3,400,000 plants grown 518,000,000 were fruit trees, of which 240,500,000 were of apple alone. Grape vines and small fruits aggregated 685,600,000. From other estimates it is concluded that in most species less than half of the plants grown in nurseries reach maturity; for instance, the census of apple trees in 1900 was 201,794,764, of which a large proportion are young trees not in bearing.

The great majority of trees raised in the fruit nurseries of America are for orchard planting and are trained erect; whereas in European nurseries they are trained in many forms, such as espaliers, dwarfs, standards, bushy forms, etc. Ornamental trees are largely grown from cut-

tings, layers, etc., fruit trees from scions, either by grafting or budding (see GRAFTAGE). The former method is preferred in the western States, first, because more than one tree may be obtained from one root used as stock, and second, because the long scion placed upon the foster stock will take root if placed far enough below the surface, a process which eliminates much of the uncertainty felt with respect to hardiness of trees upon nondescript stocks. In the East fruit trees are generally budded, since budding supplies whole roots in full activity at the time of performing the operation.

To supply the nurseries with stocks for the various fruit trees, specialists have arisen, particularly during the closing decade of the 19th century, and the nurseryman who raises his own stocks, except of peaches, is the exception. France supplies most of the pear and cherry stocks, and many stocks of other kinds; the prairie States furnish the great bulk of the apple stocks. The fruit tree nurseryman therefore confines his efforts largely to the propagation of the plants after budding or grafting. He is thus enabled to bend his energies to the production of large trees in restricted time, a process which is believed to exhaust the soil to such an extent that two crops of nursery trees are rarely grown upon the same land oftener than once in five years, during which time the land is devoted to clover or other crops which tend to improve the texture of the soil and the content of humus. Hence nurseries are likely to change their situations frequently and hence to occupy rented land. Ornamental and forest trees are believed to be less exhaustive and are thus more stable in their establishment. Commercial manures seem to be slower in bringing "treed" land into condition again than are stable manure and green crops.

Prior to the establishment of the agricultural experiment stations, nurseries exercised a profound influence upon the fruit industries throughout the country. Though they still play an important role they have a narrower scope, much of the variety-testing at present being conducted by the experiment stations. The leading nurseries are still looked to for much authoritative information, and they still seek to maintain and foster their business by honest and conservative methods and the sale of correctly named and healthy stock only.

Since the introduction of new fruits from abroad, or even from other localities in the United States, has been found to bring into action new insect and fungus enemies, State legislation has established inspectors of nursery stock. The most progressive nurserymen, accordingly, have adopted methods of control such as fumigation-houses. Badly infested stock is generally destroyed as the best means of preventing the spread of the pests to new, uninfested localities.

For the unification of interests and the improvement of methods the American Association of Nurserymen was formed, and a monthly magazine, 'The American Nurseryman,' is published at Rochester. Consult Bailey, 'The Nursery-Book' (1896).

Nursery for Children, Hygiene of the. There is no part of the home requiring more particular and intelligent care with respect to the conditions of health than that which is assigned to the children of a household. The

NURSERY LORE AND NURSERY RHYMES

children's apartment should be a large, sunny, dry, and well-ventilated room. Absence of sunlight is as bad for children as plants—both grow pale and sickly in consequence of it. Excess of sunlight can be averted by blinds, awnings, or dark-colored (preferably green) window-shades. The room should be above the first floor, in a well-built house, on dry ground, and should have good plumbing. The furniture of a nursery should be comfortable, but simple and easily cleaned. The floor is best covered with a carpet or rug which can be readily removed for cleansing, or when a contagious illness prevails. The walls should be either painted (preferably a light gray), varnished, or covered with a varnished paper which can be washed. Dirt must be kept out of the nursery. There should be no heavy furniture. All cupboards and closets should be kept clean and well aired. There should be no "tuck-away" places. Dosing, as ordinarily carried out—that is, the transferring of dust from one place to another—should be unknown. Dust should be removed by hand, with a slightly moistened piece of cheese-cloth, and with the cloth fastened in a metal grasp fitted to the end of a pole made for that purpose. The floor should be swept after moistened tea leaves or sawdust have been sprinkled over it. The corners of the room should be rounded so that no dust can lodge in them.

Ventilation and Warming.—While a nursery should be always comfortably warm, it should be well aired or ventilated, and fresh air must come from out of doors. Few houses are equipped with such a good system of heating and ventilation that the opening of a window to admit air is not necessary. But cold air should not blow upon the child. In fact, in cold weather children should not be allowed to stay near a window, even if closed, as it is the cold air that comes through crevices that "cuts like a knife." As the current of cool air is greatest along the floor of a room, in cold weather children should not sit upon the floor. The room may be frequently ventilated by opening a window for a short time at the top, the children meanwhile being more warmly clad. Or the air may be admitted through an elbow tube, or through the space between the upper and lower sash, the lower sash being raised several inches and having under it, along its entire length, a board (window-board). A stout piece of cloth, decorated if desired, may be fastened across the lower part of the window, with the window raised nearly to the upper edge of the cloth, the air comes tempered through the cloth, and also between the upper and lower sash. The upper sash may be lowered a few inches, and a frame covered with one or more layers of cloth fitted in between the sash and the window-frame. As lamp and gas light readily pollute the air of a room, protected candles are better.

The temperature of a nursery should be from 65° to 70° F. Open fire-places, the Franklin and barrack stoves, or hot-water pipes are frequently better for heating purposes than close stoves or furnaces, which unduly dry the air. If close stoves are used they should have no dampers. All heating and lighting apparatus should be well protected, so that children cannot burn themselves or set fire to anything.

Nuisances and Sources of Contamination.—There should be no imperfect plumbing in the nursery—in fact, all plumbing would better be in an adjacent room. Soiled napkins and other offensive articles should be promptly removed from the nursery, also remnants of food. Toys should, so far as possible, be unpainted and clean. Disinfectants are rarely needed, except in cases of sickness, if sunlight, good air, and cleanliness are secured.

Toilet.—While a warm bath, with the occasional use of a pure soap and thorough drying, is necessary, the child should become accustomed to cool water. This can usually be accomplished by gentle sponging with cool water after the use of warm water. A child does not always need a daily bath. Soft towels or cloths are best for drying purposes. Toilet-powders need not be used except where the skin remains moistened. Much of the soreness upon the buttocks and in the groins can be prevented by the use of dry, soft napkins, washed in soft water and with a soap containing little alkali. The scalp and teeth should be kept clean, and only soft brushes employed. A comb should rarely be used.

Dress.—This should be sufficiently warm, and as small in amount as is consistent with comfort. The underclothing is of the most importance, and should be of woolen or linen mesh-work of varying degrees of thickness, depending on the seasons of the year. The fabric of children's clothing should be soft. Tight constriction by bands is injurious. When a child begins to use its limbs freely the clothing should be shortened. Shoes should be soft, and for young children without heels, and should not cramp the toes.

Food.—The child's food should be well cooked and clean; the milk should be pure; if there is any doubt as to its purity it should be sterilized. Long-tubed nursing-bottles should not be used. All receptacles of food should be kept clean. Boiling and straining the drinking-water is frequently advisable. It should be cooled by placing it in corked bottles in the refrigerator.

Nursery Lore and Nursery Rhymes are songs and jingles for children handed down from past generations. These folk-lore jingles are mechanically repeated in the play-room and on the play-ground, the children having little if any knowledge of the significance or origin of the rhymes. Being in verse form they are easily preserved, either as mere traditional rhymes, or as formulas to be used in games; and, as unconscious survivals of a remote antiquity, they not infrequently preserve for the scientific inquirer fragments of ancient incantations for healing diseases or revealing the future, and invocations combined with ceremonial observances, while the intimate nature of the religious conceptions involved points back unmistakably to a mediæval origin. Children with all their inventiveness and imagination are slaves of the letter, and most of their game-formulas are handed down from generation to generation along with the games themselves. In their characteristic directness, point, and quaintness of phrase, they defy imitation, and in their faculty of arresting the imagination from age to age they reveal the instinct of perpetuity. Many of them are beyond doubt survivals among children of May games,

ring-songs and dances, rounds, and kissing games which in old England were played by grown-up people, and these of the higher grades of society. Many of these are still current in America which are now forgotten in the mother-country, although they not infrequently have equivalents on the continent of Europe. Under the same general head are included nursery rhymes proper, and counting-out rhymes, cumulative rhymes, courting and love games, playing at work, flower oracles, and riddle and guessing games; while on the other hand popular mottoes, old saws and maxims relating to husbandry, the weather, or the like, and all the wealth of local rhymes and sayings belong to the popular rhymes of folk-lore generally. The verses usually consist either of a rhyming couplet, or of four lines in which the second and fourth rhyme; they are often accompanied by a refrain, which may be a single added line, or may be made up of two lines inserted into the stanza; and in place of exact consonance, any assonance, or similarity of sound, will answer for the rhyme.

Upon the subject of nursery rhymes upward of 70 volumes have been published and none of these are more authentic than 'The Games and Songs of American Children' by W. W. Newell, published in 1884. Other works are: Chambers, 'Popular Rhymes of Scotland' (1842); Halliwell, 'Nursery Rhymes of England' (1860). See also FOLK-LORE; PROVERBS; RIDDLES.

Nus, Eugène, é-zhân nus, French dramatist: b. Châlons-sur-Saône, France, 1816; d. 1894. He was an ardent Socialist, and his first success as a dramatist was with his 'Jacques le Corsaire' (1844). Among his works are: 'L'Enseignement mutuel' (1846); 'Choses de l'autre Monde' (1880); 'Vivisection du Catholicisme' (1894); etc.

Nusku, noos'koo, in Assyrian mythology, a solar deity who afterward became a fire god. He was regarded as a messenger of the gods.

Nussbaum, noos'bowm, Johann Nepomuk, German surgeon: b. Munich, Bavaria, 2 Sept. 1829; d. there 31 Oct. 1890. He studied in Munich, Würzburg, Berlin, and Paris, and in 1860 became a professor at the University of Munich. He published: 'Die Pathologie und Therapie der Ankylosen' (1866); 'Die Verletzungen des Unterleibs' (1880); 'Ueber Chloroformwirkung' (1885); etc.

Nût, noot, in Egyptian mythology, the goddess of the sky, wife of Keb, the god of earth.

Nut, a piece of metal tapped, and adapted to be screwed on the end of a butt. It is used for many purposes, but especially on the end of a screw-bolt, in order to keep it firmly in its place.

Nut Brown Maid, The, an old English ballad, the earliest extant form of which is found in Arnolde's 'Chronicle' (1502). It is based on the legendary story of Henry Clifford, known as 'The Shepherd Lord.' Consult Percy, 'Reliques,' series 2, book i, 6.

Nut-gall, a hard, nut-like gall (q.v.), especially those from the Asiatic oaks, used in ink-making and for other purposes. The Chinese and Japanese nut-galls of commerce, however, are from species of *Rhus*, and are large

and very irregular in form. They contain from 30 to 60 per cent of tannin, and are the source of gallic acid ($C_7H_5O_6$) which appears in white silky needles, soluble in alcohol, less so in ether, and sparingly soluble in cold water; it is precipitated blue-black by ferric salts, the color disappearing on boiling, and is not affected by gelatine, except in the presence of gum. Consult Maisch, 'Materia Medica' (2d ed. 1885).

Nut-grass, or **Chufa**, a sedge of the genus *Cyperus*, especially *C. esculentus*, of the Eastern and Southern States, whose root-stocks bear small tubers, like nuts, which are edible to man, and of good flavor when roasted; and which are highly nutritious to hogs who eagerly search for them. Consequently these sedges are planted in some parts of the country as a food-crop for swine. An oil may be expressed from these tubers, or "ground-almonds," which is an excellent substitute for olive-oil for table use.

Nut-lock, a means for fastening a bolt-nut in place preventing its becoming loose by the jarring or tremulous motion of the machinery. Such are used upon fish-plates of railways, upon harvesters, etc.

Nut-weevil, a snout-beetle of the genus *Balaninus*, which deposits an egg in the kernel of a nut, when it is young, where the egg hatches and the grub feeds until the kernel is destroyed, when it bores its way out through the shell. Several species infest the various commercial nuts.

Nutation, a slight change in the direction of the earth's axis produced by the same cause as the precession of the equinoxes, namely, the attraction of the sun and moon upon the equatorial protuberances of the earth. If the orbits of the earth and moon were circular and in the same plane, the motion of precession, which consists in a slight revolution of the direction of the earth's axis in a period of about 266 years, would be regular and uniform. But, owing to the inclination of the orbits, and the revolution of the moon's node, the real direction of the axis of the earth revolves in a small circle around its mean direction in a period the same as that of the moon's node, namely—18.6 years. Bradley discovered and explained nutation not long after his discovery of the aberration of the fixed stars.

Nutcracker, the English name of a species of crow (*Nucifraga caryocatactes*) found ranging over a wide area in the pine forests of northern and sub-Alpine Europe and Asia. It is dull brown, thickly speckled with white spots, and is about the size of a jay. The nutcracker is gregarious, wandering in bands of 50 or 100 in the autumn, but scattering to remote regions and becoming silent during the breeding season. Its chief food is nuts and seeds of conifers. It is said to hold nuts and cones with its foot and to extract the kernels by repeated blows of the bill.

A closely related American bird is Clark's crow (*Picicorvus columbianus*), discovered by the Lewis and Clark expedition in 1804-6. It is about one foot long, of a generally gray color, the wings and tail black with large white areas. It inhabits the coniferous belt of the Rocky Mountain slopes and congregates in great flocks,

NUTHATCHES—NUTRITION OF FARM ANIMALS

which rove in search of food. The well-concealed nest is built in the tops of pine trees in the higher mountain ranges. Consult Coues, 'Birds of the Northwest' (1874).

Nuthatches, small passerine birds forming the family *Sittidae*, related to the titmice, from which, and from the creepers, they are readily distinguished by the long, straight, slender bill. The typical genus (*Sitta*), with about 15 species, is confined to North America, Europe and Asia, but some related genera are found in the Southern hemisphere. In the United States we have four species and several sub-species. The common resident eastern species (*S. carolinensis*) is nearly six inches long and has the under parts white. The red-bellied nuthatch (*S. canadensis*) is an inch shorter, with the under parts rusty brown and the glossy black cap cut by a pure white stripe on each side. This is a migrant species, which breeds in the northern States and Canada and on mountain tops, but in winter extends its range to the Gulf coast. Two still smaller species, the brown-headed nuthatch (*S. pusilla*) and the pygmy nuthatch (*S. pygmaea*), are respectively southern, and far western. Both have the crown brown, not black, as in the other two species, and *S. pygmaea* may be distinguished by the black and white markings on the middle tail-feathers, which are plain in *S. pusilla*. The habits of all are similar. They spend their time in traveling restlessly up and down the trunks and limbs of trees in the most nimble manner, hanging in any attitude supported by their strong, large feet alone and without the assistance of the tail. Consequently they display greater freedom of movement than either the woodpeckers or the creepers. Their food consists chiefly of insects and their eggs. In the autumn and winter they have the habit of wedging acorns and nuts firmly in crevices, and hacking them with the bill till they break open: this is done partly for the kernels and partly for the grubs which they frequently contain. From this habit the common name is derived. Their only note is a hoarse call. They nest in holes in trees, often in crevices beneath bark, and lay four to eight speckled eggs.

Nutmeg, the hard kernel of the fruit of various species of *Myristica*, especially *M. fragrans* or *moschata*, of the order *Myristicaceae*. The common nutmeg-tree grows about 25 feet high, bears oblong, entire leaves, axillary racemes of small flowers, followed by golden yellow pear-shaped fruits which split in halves, exposing the kernel surrounded by a false aril which forms the mace (q.v.) of commerce. The fleshy halves of the fruit are used as preserves in countries where the trees are cultivated. Various species are cultivated in the tropics, particularly the East Indies, West Indies, Brazil, and Spice Islands. They are among the most important spices as which they are chiefly used. A fatty oil called oil of mace is expressed from the seed, and a nearly colorless essential oil is obtained by distillation. The tree thrives in the West Indies up to elevations of 2,000 feet, but is less productive there than at lower altitudes. It does best in well drained, rich loam, in warm, protected valleys.

Nutmeg-bird, a name among bird-dealers for an East Indian myna (*Munia undulata*), also known as cowry-bird; it is brown, with

white streaks above and spots below, a yellow rump, and a white middle to the under parts. An eastern fruit pigeon (genus *Myristicivora*) is also so called, because it feeds upon the nutmeg fruit.

Nutmeg Melon. See **MELONS**.

Nutmeg State, a popular name for the State of Connecticut, derived from the alleged ingenuity of Yankee inventors who were facetiously charged with manufacturing wooden nutmegs to be sold as genuine.

Nutria. See **COYPU**.

Nutrition of Farm Animals, **The**. The common domestic animals are fed for a variety of purposes. With cattle, sheep, and pigs, it is the object to induce gains in weight, that is, to fatten them, or in the case of milch cows, to produce gains in the form of body secretion,—milk, rather than fat on the body. In a similar way, sheep are fed for the production of wool; goats for milk or their fleece, and poultry, for the market and the production of eggs. Cattle are sometimes, and horses are almost universally, fed as beasts of burden. Animals with young require food for their development and after birth the young animal needs it for growth and the development of the body as well as for maintenance.

A great deal of information regarding food requirements has accumulated from the experience of countless generations, and for many years the problem has been studied experimentally at agricultural colleges, experiment stations, and similar institutions, in this and other countries. It is fair to say, at the present time, that the feeding of farm animals rests upon quite well defined general principles, derived from the studies of the chemist and the animal physiologist, concerning the composition and functions of food and the way it is utilized after it is eaten. Such studies show that the materials composing the body are constantly breaking down and being consumed, and that to keep the animal in a healthy and vigorous condition requires a constant supply of new material; if this is lacking or is insufficient, hunger, and finally death, result. To supply the needed materials is one of the chief functions of food, but in addition to this it maintains body temperature and also furnishes the force or energy which enables the animal to do work, and to perform the necessary functions of the body, such as keeping up the beating of the heart, the respiratory movements, and so on. Since it furnishes heat and energy, the food may be said to serve as fuel. If, in addition to maintaining the system, growth is made, as in case of a young animal, or milk is secreted, more food is needed than for maintenance. If the supply is in excess of all demands, some is stored as a reserve material, principally in the form of fat. To supply food in the right proportions to meet the various requirements, without waste, constitutes scientific feeding. By carefully studying the composition of feeding stuffs, the proportion in which they are digested and the requirements of different animals when at rest, at work, producing wool, giving milk, etc., the principles of feeding have been deduced. In applying these in practice, the cost and special adaptations of different feeding stuffs must also be taken into account.

NUTRITION OF FARM ANIMALS

The animal body and the different feeding stuffs which nourish it are all made up of a comparatively few chemical compounds, namely water, ash or mineral matter, and the so-called nutrients, protein, fats and carbohydrates, the carbohydrates being subdivided into two groups, namely, "nitrogen free extract," that is, sugars, starches, etc., and "crude fibre." Of these protein is the only nutrient which contains nitrogen, the characteristic element of body tissue, and is therefore the only one which can truly serve for building and repairing the animal body. Fats and carbohydrates serve as fuel and yield energy in the forms of heat and muscular power. Protein may also serve as a source of energy and thus has a two-fold function.

Water.—Water, though not a nutrient, is essential, being needed to dilute the blood and for other physiological purposes. All animals also require oxygen of the air for maintaining the life processes. Water constitutes from 40 to 60 per cent and ash from 2 to 5 per cent of the body; fat varies greatly with the condition of the animal, but seldom falls below 6 or rises above 30 per cent. The dry matter of the flesh, skin, bones, muscles, internal organs, brain, and nerves, in short, all the working ma-

chinery of the body, is composed quite largely of protein. (See NUTRITION OF MAN for more extended discussion of nutrients.)

Character of Food.—The feeding stuffs of most importance for farm animals are of vegetable origin, and include cereal grains, such as oats and corn, either ground or unground; leguminous seeds, as beans, peas and cowpeas; oil cakes and other commercial by-products, as linseed oil cake, cotton-seed meal, gluten feed, and so on; fodder crops, fresh and cured; and the different roots, tubers and green vegetables. In quite recent times, cane molasses, beet molasses, and other beet sugar by-products have also assumed more or less importance in this connection. As regards feeding stuffs of animal origin, milk is the natural food of the young of all mammals. After weaning, skim milk is a common food, especially for pigs. Dried blood meat meal, and similar feeds of animal origin are also sometimes fed. The composition of a number of the more important feeding stuffs may be seen by reference to the subjoined table, which shows the average composition as determined by analysis and also the digestible nutrients furnished by each 100 pounds of the feeding stuffs.

TABLE 1.—AVERAGE COMPOSITION OF A NUMBER OF FEEDING STUFFS.

KIND OF FEED	Percentage composition						Digestible materials in 100 pounds			Energy in 100 lbs. digestible nutrients
	Water	Protein	Fat	Nitrogen free extract	Crude fiber	Ash	Protein	Carbo-hydrates		
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	lbs.	lbs.	lbs.	Calories

a Largely non-albuminoid nitrogenous materials.

b Very largely sugars.

NUTRITION OF FARM ANIMALS

It will be seen that the cereal grains resemble one another quite closely in composition, being characterized by a fairly low water content and a considerable amount of protein and nitrogen-free extract. Some crude fibre derived largely from the outer or bran layer of the grain is also present. Bran, shorts, middlings, and other by-products and cereal grains vary in composition, but all have a low water content while the crude fibre content is rather high, and the nutritive ingredients are principally protein and carbohydrates. The large proportion of crude fibre is due to the fact that these products represent the outer layers of the grain which are more hard and firm in structure than the interior portion which consists quite largely of starch. Beans, peas, and leguminous seeds resemble the cereal grains in having a low water content, though in general they furnish a higher percentage of protein. Such foods are known to be useful and valuable, but with the possible exception of cowpeas, they are not very commonly fed in the United States, although much used in Europe.

Concentrated Feeds.—The various cakes, gluten meals, and similar feeding stuffs are, generally speaking, commercial by-products. Thus, cotton-seed cake is the material left after the oil has been expressed from the cotton-seed. In the same way linseed cake is the residue obtained from flaxseed in the manufacture of linseed oil. When this is ground it becomes linseed meal. In the manufacture of beer the malted grain remaining is known as brewers' grains, and is best fed after drying. When starch is manufactured from corn, the nitrogenous portion of the grain is rejected and constitutes gluten feed and gluten meal. There are a number of mixed feeds on the market which are made up of shrunken grains, branny material, and other residues obtained in the manufacture of cereal breakfast foods, etc. These vary in feeding value, some of them comparing favorably with more common cereal feeds. Grain, ground and unground, commercial by-products, leguminous seeds, oil cakes and similar products are very frequently called concentrated feeds, the name being suggested by the fact that their feeding value, especially the protein content, is high in comparison with the bulk. So far as the general experience and the result of American and foreign experiments go, most of the common feeding stuffs in the group are wholesome and valuable. Some are more prized than others for a particular purpose. Thus, oats are a favorite food for horses, especially in the Eastern United States, and other regions where they are a staple crop, but in the South and Middle West, corn is the most important feed. For fattening cattle, sheep and hogs, corn is undoubtedly the most important grain in the United States.

Forage Crops.—The various forage crops—grass, clover, Kafir corn, corn, etc., all have a high water content when fresh, that is, they are more or less succulent and juicy. They contain, however, considerable nutritive material, chiefly protein and carbohydrates, and are valuable feeding stuffs. The leguminous forage crops—alfalfa, clover, cowpeas, soy beans, vetch, etc.—are richer in protein than the grasses. When forage crops are dried and cured the resulting hay is richer in proportion to its bulk than the green material; in other

words, it has been concentrated by the evaporation of the greater part of the water present. However, this is not the only change which has taken place. When hay is properly cured, it undergoes a peculiar sort of fermentation or oxidation materially affecting its composition, improving the hay by diminishing the quantity of crude fibre, and by increasing the relative amount of other nutrients, especially nitrogen-free extract. Hay which has undergone proper curing has a better flavor and agrees better with animals and is apparently more digestible than hay which has dried quickly in the sun without fermentation.

The feeding value of different forage crops, fresh and cured, depends in considerable degree upon the stage of growth, the nutritive value of the crop, generally speaking, increasing until the growth is complete and diminishing somewhat as the plants mature or become overripe. Straw, the fully ripened stalk of cereal grains contains some nutritive material, but is less nutritious than the same portion of the plant cut before ripening. In the perfectly ripe condition the nutritive material, elaborated in different portions of the ordinary forage plants, has been largely conveyed to the seed and used for its development or stored as reserve material.

Silage.—Green forage crops are frequently preserved by ensiling. In this process the material undergoes a peculiar oxidation which correspondingly changes it in composition and food value. Some of the carbohydrates are changed into alcohol, acetic and other acids, and crude fibre is undoubtedly softened somewhat and possibly the silage is thus rendered more digestible. Bodies having peculiar flavor and odor are also formed. The green crops, hay, straw and other cured crops and silage are frequently called "coarse fodder" or "roughage." This term is due to the fact that they contain a comparatively small amount of nutritive material and a high proportion of crude fibre as compared with their total bulk. Although inferior to concentrated feeds in composition, they are an essential part of the ration of farm animals, serving to give the required bulk to the food and being useful in other ways. It is believed that unless the food when taken into the stomach is comparatively bulky and the mass is more or less loose in structure, it is not readily acted on by the digestive juices.

The outcome of many experiments made with farm animals is in accord with the observation of careful feeders, namely: that the various common coarse fodders may be fed very largely as circumstances demand. Although timothy hay is regarded, in some regions, and corn fodder in others, as the best coarse feed, yet, experience has shown that both these feeds, and also hays from wheat, barley and other cereal grains, and from clover and alfalfa, are all of great value. Fresh herbage was, of course, the original food of domestic animals, and in early times, natural pasturage was almost entirely depended upon to support them during a considerable part of the year. The importance of pasturage is still conceded, but the fact is also recognized that if, owing to drought or other cause, the supply is insufficient, other food will be needed. When green feed is cut and fed fresh to farm animals, more or less confined, the practice is called "soiling," and is becoming quite prevalent, especially in older countries

NUTRITION OF FARM ANIMALS

where land is expensive. It is coming into use in some localities of the Eastern United States to such an extent as to entitle it to recognition as one of the systems of feeding. Partial soiling is much more common, being relied upon to carry animals through the period when pastures are short. Under the soiling system, a larger number of animals can be kept upon a given acreage, and by allowing open air exercise in a large yard or pasture, the practice has been demonstrated as entirely feasible for dairying animals. On an average, carrots, Swedish turnips or rutabagas, and other roots and tubers, green vegetables, and fruits contain a high percentage of water and small amounts of the different classes of nutrients. The percentage of crude fibre is smaller than in the green forage crops, but since the proportion of nutritive material is small in comparison with the total bulk, they are ordinarily referred to as coarse fodder. The establishment of beet-sugar factories in this country has led to the production of immense quantities of sugar-beet pulp as a waste material, sometimes called "diffusion residue," or "beet chips," which consist of the residue of the beet after the extraction of the sugar under pressure in the diffusion batteries. Sugar-beet molasses is another product of the beet-sugar manufacture, which accumulates in large quantities, and both this and cane molasses are coming to be regarded as an important feed. It owes its value largely to the sugar in it.

Preparing Feed.—It is often claimed that cooking feed increases its palatability and digestibility. The general opinion drawn from experiments with farm animals is that this belief is not warranted and that the cost of cooking is not made up for by the increased value of the ration. Soaking feed, especially hard grain, renders it more easily masticated, and possibly increases its digestibility, but the general conclusion is that the importance of soaking feed for most farm animals is overestimated, although soaking wheat for pigs is quite generally recommended. Sprinkling or wetting dry hay lays the dust and is a practice often resorted to, particularly for horses, as the dust from dry hay, especially clover, is believed to cause heaves. Opinions differ as regards the advantages of grinding grain, but from the results obtained in a large number of tests with farm animals, it does not appear that the superiority of ground over unground grain is sufficient to pay for the cost of grinding, provided the animals have good teeth and sufficient time to chew their food thoroughly. Chaffed or chopped coarse fodder occupies less space for storage than uncut hay or straw and can be readily handled. Shredding corn fodder is an economical practice, and more of the stalks and harder portions will be eaten than when fed whole, but for most farm animals in general, the practice of cutting or chopping coarse fodder is much less followed in the United States than in Europe. Precaution should always be taken to avoid feeding stuffs which are harmful in themselves or which become harmful. Dirt, small stones, etc., should be removed from grain by proper screening and all feeding stuffs should be clean. Moldy feeds and those which are more or less decomposed are unwholesome, and may prove a cause of various diseases. Plants which are infested with ergot are also harmful. There are a number of plants which are poisonous to stock, such as

rattlebox (*Crotalaria sagittalis*), larkspur (*Delphinium* sp.), death camass (*Zygadenus venenosus*), water hemlock (*Cicuta* sp.), etc., and care should be taken to prevent animals from securing them. An explanation of the poisoning of stock by young sorghum and other green plants ordinarily wholesome, is offered by the discovery of a peculiar glucosid, which with the aid of a special ferment, also present in the plants, liberates prussic acid. This is doubtless always present in at least minute traces, but apparently becomes dangerous when the plant is arrested in dry weather at certain stages of its growth. Sunlight such as prevails in the arid and semi-arid regions of the United States sometimes causes the development of the poison in excess.

Digestibility of Feeds.—The real value of any feeding stuff is determined not alone by its composition, but also by its digestibility; that is, by the amount of material which it gives up to the body in its passage through the digestive tract. It is evident that if two feeding stuffs have practically the same composition, but one gives up more material to the body than the other—that is, is more thoroughly digested—it must actually be more valuable than the other material. The bulk of the substance of almost all feeding stuffs is insoluble when eaten. Only material in solution can pass through the walls of the stomach and intestines into the circulation and be utilized by the body; therefore, digestibility consists chiefly in rendering insoluble materials soluble. This is effected by the aid of digestive ferments and also to a less extent by bacteria. The usual method of ascertaining the digestibility of a given material is to feed it for a longer or shorter time, the amount and composition being determined. From the total nutrients consumed, the amounts excreted undigested in the feces are deducted, showing the amount of each retained in the body. It is the usual custom to express the amounts digested in percentages, the results thus obtained being termed coefficients of digestibility. As regards the results of digestion experiments with farm animals as a whole, it may be said that the percentage of protein digested is fairly high, being greater in grains and seeds than in hay or grasses. Generally speaking, the value obtained for the digestibility of fat is rather low, but there are reasons connected with the analytical methods commonly followed which render the results obtained with fat not altogether satisfactory. Nitrogen-free extract is quite thoroughly digested by farm animals, but crude fibre is not very thoroughly assimilated. Farm animals differ considerably as regards the thoroughness with which they digest their foods. It seems fair to say that in general, ruminants digest a larger percentage of fats, carbohydrates, including crude fibre, than horses, the difference being most marked in the case of the crude fibre. Pigs ordinarily digest their food quite thoroughly. These results are in accord with what might be expected from differences in the digestive organs of the different classes or animals.

Food Requirements.—Attempts have been made to ascertain the food requirements of various kinds of farm animals under different conditions, and large numbers of feeding experiments have been made under varying conditions with this end in view. From the results feeding standards have been deduced which show

NUTRITION OF FARM ANIMALS

the amounts of digestible protein fat, and carbohydrates, supposed to be best adapted to different animals when kept for different purposes.

The feeding standards prepared by Wolff, a German investigator in animal nutrition, have been the most widely used of any. Wolff's standards have recently been modified by Prof. E. Lehmann, as the result of additional experiments and practical experience, and also in the attempt to adapt them more closely to the practical needs of the animal. A number of these standards are as follows:

TABLE II.—WOLFF-LEHMANN FEEDING STANDARDS.
(Amounts of nutrients required per day per 1,000 pounds live weight.)

ANIMAL.	Total Dry Matter	Digestible Nutrients			Fuel Value
		Protein	Carbohydrates	Fat	
	Pounds	Pounds	Pounds	Pounds	Calories
Oxen at medium work.....	25	2.0	11.5	0.5	27,200
Oxen at heavy work.....	28	2.8	13.0	0.8	32,760
Fattening cattle:					
First period	30	2.5	15.0	0.5	34,650
Second period	30	3.0	14.5	0.7	35,500
Third period	26	2.7	15.0	0.7	35,900
Milk cows:					
Giving 12 lbs. milk per day.....	25	1.6	10.0	0.3	22,050
Giving 16.5 lbs. milk per day.....	27	2.0	11.0	0.4	25,850
Giving 27.5 lbs. milk per day.....	32	3.3	13.0	0.8	33,700
Fattening sheep:					
First period	30	3.0	15.0	0.5	35,600
Second period	28	3.5	14.5	0.6	36,000
Horses:					
Light work	20	1.5	9.5	0.4	22,150
Medium work	24	2.0	11.0	0.6	26,700
Heavy work	26	2.5	13.5	0.8	30,750
Fattening swine:					
First period	36	4.5	25.0	0.7	57,800
Second period	32	4.0	24.0	0.5	54,200
Third period	25	3.7	18.0	0.4	40,200

It should be borne in mind that feeding standards are simply a concise and approximate statement of the amounts of the different nutrients required by animals, as indicated by the results of experiments and observation, and are intended to apply to the average conditions. No single standard can be laid down for all conditions. Good judgment and intelligent observation on the part of the feeder are also necessary. The value of any ration which may be determined upon may be calculated with the aid of the feeding standards and the figures in Table I. Suppose four pounds of oats constitute one of the ingredients of a ration. According to the table, it is evident that if 100 pounds of oats furnish 9.25 pounds digestible protein, one pound will furnish .0925, and four pounds will furnish .3700. In the same way, if 100 pounds of oats supply 124,760 calories of energy, one pound will furnish 1247.60 calories and four pounds will furnish 4990.40. The sums of the protein supplied by all the feeds show the total amount in the ration, and so on, with all the other nutrients, and with the energy. In making such calculations, it is a common practice to consider only the protein and energy value since these factors show the essential features of the food and the calculation is somewhat simplified without materially lessening the value of the results. It is not necessary that a ration should furnish each day the exact amount called for by the standard but rather that it should approximate it through long periods, a slight deficiency at one time being made up by a corresponding excess at another. In

calculating rations it is essential that weights be used rather than measures. It is often inconvenient to weigh the grains, but the weight may be calculated with sufficient accuracy by the figures given below, which show the weight of a quart of a number of common feeding stuffs.

Some of these materials, especially by-products like wheat bran, vary considerably in weight, and the given figures cannot be regarded as strictly accurate. Weighing is, of course, always the safer way where it is desired to feed quite definite amounts. In selecting feeding stuffs for his stock, the farmer will naturally

be governed by the conditions of the market. The cost of feeding stuffs is controlled by other factors than the actual amounts of food materials which they contain; indeed, there often appears to be very little connection between the two. Bearing in mind that the protein is the most expensive ingredient, and the one especially sought in concentrated feeds, the farmer can make his selection with the aid of such data as are given in Table I. Of course, the special adaptability of some materials to different kinds of animals and different purposes will also be taken into account.

WEIGHT OF FEEDING STUFFS PER QUART.

	lbs.	qts.
Corn cracked	1	1.3
Corn meal	1	8
Corn-and-cob-meal	1	6
Oats, whole	1	..
Oats, ground	1	12
Wheat, whole	1	14
Wheat bran	1	10
Wheat bran coarse	1	8
Wheat middlings	1	7
Wheat middlings, coarse	1	13
Gluten meal	1	11
Gluten feed	1	3
Linseed meal	1	2
Cotton-seed meal	1	8

Another important consideration where fertilizers or manures have to be relied upon is the manurial value of a feeding stuff. If the manure is carefully preserved a large proportion of the fertilizing constituents of the feed is recovered in the manure, and goes to enrich the land. (See FERTILIZERS.)

Feeding Stuff Inspection.—A number of dif-

NUTRITION OF MAN

ferent States have passed laws requiring that the composition of certain classes of feeding stuffs be guaranteed by the manufacturer, and providing an inspection of these goods to see that the guaranty is complied with. These laws in general apply only to the so-called concentrated feeding stuffs, especially the by-products and mixed feeds, and not the cereal grains sold as such. The inspection is usually in charge of the Agricultural Experiment Stations; and is managed very similarly to the fertilizer inspection. The need for this inspection arises from the quite wide variation in the composition of many of the by-products, the confusion of names, as in the case of the by-products from starch manufacture, the large number of mixed feeds which are put upon the market under proprietary names, and the occasional tendency to mix with the material substances of inferior value. The feeding stuff inspection protects the farmer from fraud in the same way as the fertilizer inspection, and gives him the benefit of a guaranteed composition in buying. The result of this inspection, which has been in operation a number of years, has been quite marked in driving inferior grades of goods, like adulterated cotton-seed meal, out of the market, and tending to bring about greater uniformity in composition in the case of standard by-products.

C. F. LANGWORTHY,

Department of Agriculture, Washington D. C.

Nutrition of Man. To be properly nourished, man must be supplied at suitable intervals with the foods which will best serve to build the body, maintain it in health, and permit of the performance of the necessary amount of mental and physical work. Food may accordingly be defined as that which taken into the body, builds tissue, or yields energy. Blood and muscle, bone and tendon, brain and nerve, in fact, all the organs and tissues of the body, are formed from the nutritive ingredients of food, and with every motion of the body, and doubtless with the exercise of feeling and thought as well, some material is consumed which must be re-supplied by the food. If the food supply is just sufficient for the needs of the body, the weight remains constant, except for the daily fluctuations dependent upon the water consumed, contents of the intestinal tract, etc. If the food supply is insufficient, the body loses weight, while if more is consumed than is needed, reserve material, usually fat, is stored and the body gains in weight. In one sense, the body is a machine of a superior sort. Like other machines, it needs materials to build its several parts, to repair them when worn out and to serve as fuel. It uses this material like a machine in some ways, and in others differently. The engine gets its power from fuel and so does the body,—in the one case, coal or wood, and in the other, meat, bread, milk, etc., serving this purpose. In both cases, the energy latent in the fuel and called potential energy is transformed into heat and power. When coal is burned in a furnace, some of its potential energy is transformed into the mechanical power used by the engine for its work; the remainder is wasted in the heat not utilized by the engine. In a similar way, the potential energy of food is transformed in the body into heat, to keep the body warm, and into mechanical power employed for muscular work, but this is done more

economically than by the engine. If more heat is generated than is required, it is wasted, just as in the case of the engine. The human machine differs in one important particular from the steam-engine, namely, it is self-building, self-repairing and self-regulating. Then, too, if need be, the body can use its own substance, stored fat, for instance, as fuel, and the engine cannot. But besides all this, the body is more than a machine. It has not only organs to build and maintain, but has a nervous organization as well as sensibilities and the higher intellectual and spiritual faculties, and it seems fair to insist that the right exercise of these depends upon the proper nutrition of the body.

Composition of Foods.—The study of foods has shown that although they differ so much in texture and appearance, they are in reality made up of a few chemical constituents, namely, protein, fat, carbohydrates and ash, together with a larger or smaller amount of water. The latter can often be seen, as in the juice of fresh fruits or meat. In flour or dried beef, no water or juice is visible, but a small amount is contained in the tissues in minute particles, and may be separated in the laboratory. Protein is the name given to the total group of nitrogenous materials present. The group is made up mainly of the true proteins such as the gluten of wheat, the albumen of egg, etc., and nitrogenous materials such as amids which are believed to have a lower food value than the albumens.

The group "fat" includes the fat of meat, as suet and lard, the fat of milk (butter), true vegetable fats and oils like olive oil or the oil in corn, as well as vegetable wax, some chlorophyll (the green coloring matter in leaves, etc.), and other vegetable coloring matters, in brief, all the materials which are extracted by ether in the usual laboratory methods of estimating fat. The name "ether extract" is often and quite properly applied to this group.

The group "carbohydrates" includes starches, sugars, crude fibre, cellulose, pentosans, and other bodies of a similar chemical structure. This group is usually subdivided, according to the analytical methods followed in estimating it, into "nitrogen-free extract" and "crude fibre"; the former subdivision including principally sugar, starches, and most of the pentosans, and the latter cellulose, lignin, and other woody substances which very largely make up the rigid structure of plants. The carbohydrates occur chiefly in vegetable foods, though some are found in animal foods, milk-sugar being a familiar example.

The group "mineral matter" includes the inorganic bodies present in the form of salts in the juices and tissue of the different food, the principal chemical elements found being sodium, potassium, calcium, magnesium, chlorine, fluorine, phosphorus, and sulphur. The term "ash" is often and very appropriately used for this group, since the mineral matter represents the incombustible portion which remains when any given food is burned.

Food, as we buy it at the market or even as served on the table, contains a large or smaller amount of material, which is not or cannot be eaten, and which would have little or no nutritive value if it were eaten, such, for instance, as the bones of meat and fish, the shells of eggs, and the skins and seeds of vegetables and fruits.

NUTRITION OF MAN

In discussing the chemical composition of foods, such portions are usually spoken of as refuse, but they form an important item when the actual cost of the nutrients of food is considered. The materials grouped together as refuse contain the same ingredients as the edible portion, though generally in quite different proportions. Thus bones are largely mineral matter with a little fat and protein. Bran of wheat contains a large amount of crude fibre or woody material, with a little starch, etc. In some cases, material which is edible is classed as refuse because the flavor is objectionable. Thus peach or plum pits are too highly flavored to be palatable, and if eaten in quantity are undoubtedly actually injurious. The edible portions of food which are rejected in its preparation or at the table are spoken of as waste. The chemical composition of a food serves as a basis for judging of its value for building and repairing body tissue. Its value as a source of energy must, however, be learned in another way. The most usual way of measuring energy is in terms of heat, the calorie being taken as a unit. This is the amount of heat which would raise the temperature of 1 kilogram of water 1° C., or 1 pound of water 4° F. Instead of this, the unit of mechanical energy, the foot-ton (the force which would lift 1 ton 1 foot), may be used, but it is not as convenient. One calorie corresponds very nearly to 1.54 foot-tons.

Fuel Value of Food.—The fuel value of any food is equal to its heat of combustion less the energy of the excretory products derived from it, and may be learned by taking into account the chemical composition of the food, the proportions of the nutrients actually digested, and oxidized in the body, and the proportion of the whole latent energy of each, which becomes active and useful to the body for warmth and work. However, the fuel value may be and often is calculated from the composition of the food material supplied, on the assumption that 1 gram of protein furnishes 4 calories, 1 gram fat 8.9 calories, and 1 gram carbohydrates 4 calories, or one pound protein 1,820 calories, 1 pound fat 4,040 calories, and 1 pound carbohydrates 1,820 calories.

The relation between the quantities of nitrogenous and nitrogen-free nutrients in the ration is called the "nutritive" or "nutrient ratio." In calculating this ratio, 1 pound of fat is taken as equivalent to 2.25 pounds of carbohydrates—this being approximately the ratio of their fuel values—so that the nutritive ratio is actually that of the protein to the carbohydrates plus 2.25 times the fat.

All the organs and tissues of the body contain nitrogen. Protein is the only nutrient which supplies this element, and is therefore essential for building and repairing body tissues. The other elements required, namely carbon, oxygen, and hydrogen, may be supplied theoretically, at least, by protein, fat or carbohydrates; but a well-balanced diet should contain all the nutrients in proper proportion. Protein, fat, and carbohydrates may be burned with the formation of carbon dioxide and water, and therefore all may serve as a source of energy, but for protein this is the less important, and probably less usual function. The fats and carbohydrates by being themselves used as fuel, leave the protein for its indispensable work of

tissue forming. In an ordinary mixed diet, meat, fish and milk, among animal foods, and cereals among vegetable products, are the chief sources of protein. About nine tenths of the fat in the ordinary diet is supplied from animal foods, while approximately nine tenths of the carbohydrates are furnished by vegetable foods.

The mineral matter in food is required for a number of different purposes, a considerable amount being needed for the formation of the skeleton. Some is also present in the organs and tissues. It cannot, however, be regarded as a source of energy, according to commonly accepted theories, since it cannot be burned with the formation of carbon dioxide and water. The water present in the food is not a nutrient in the sense that it serves for building tissue or yielding energy, but it is essential, serving for carrying the food in the digestive processes, for diluting the blood, and for many other physiological purposes. The oxygen of the air is required by man as by all living animals for the combustion or oxidation of the fuel constituents of food.

The average composition of a number of common foods and the energy which one pound will furnish when burned in the body, are shown in Table I., on the following page.

It will be seen that meats, fish, eggs, milk, fresh vegetables, and fruits contain the most refuse and water; that protein is most abundant in the animal foods and in the dry legumes, and occurs in considerable quantities in the cereals; that fats occur principally in the animal foods; that carbohydrates are found almost exclusively in the vegetable products and milk; and that small quantities of mineral matter are found in practically all food material. The fuel value varies within wide limits, being greatest in those materials which contain the most fat and the least water.

Digestibility of Foods.—One of the most important considerations in fixing upon the value of any given food is its digestibility, in other words, the proportion of its nutritive ingredients which the body can retain and utilize. As frequently employed, the term digestibility has several other significations. Thus, to many, it conveys the idea that a particular food "agrees" with the user, in other words, that it does not cause distress when eaten. The term is also quite commonly understood to mean the ease or rapidity of digestion, and one food is called more digestible than another, because it is digested more easily or in less time. However, the term digestibility, as most commonly used in scientific treatises, refers to thoroughness of digestion. In brief, digestibility consists in rendering insoluble materials soluble, and is accomplished with the aid of digestive ferments and perhaps, though to a smaller degree, by micro-organisms. The principal digestive ferments are contained on the saliva, in the gastric juice of the stomach and the pancreatic juice of the intestine. The saliva has the power of changing starches into sugar. The gastric juice acts upon protein, and the pancreatic juice upon the protein, fat, and carbohydrates. Digestion is aided by fine division of the food in chewing, and by muscular contractions, that is, the so-called peristaltic action of the stomach and intestine, which helps to mix the digestive juices and their ferments with the

NUTRITION OF MAN

food. The digested food passes through the walls of the alimentary canal into the blood and then and later undergoes marked chemical changes. The heart pumps the blood containing the nutrients of the digested food, and the oxygen which it gets in the lungs, all over the body, and thus the organs and tissues are supplied with the materials which they need for their particular functions. At the same time, the blood carries away the waste which the exercise of these functions has produced. The living body tissue has the power of selecting the necessary materials from the blood and building them into its own structure, but just how it does this it is not possible to say.

The parts of the food which the digestive juices do not or cannot dissolve, and which therefore escape digestion, are periodically given off by the intestine. Such solid excreta, or feces, include not only the particles of undigested food, but also the so-called metabolic products, that is, residues of the digestive juices, bits of the lining of the alimentary canal, etc. The other excretory products are the urine, respired air and perspiration.

The chemical elements of which this bodily waste is composed are, of course, the same as those making up the body and its food, namely, carbon, oxygen, nitrogen, calcium, etc. Most of the carbon and part of the oxygen are given off from the lungs as carbon dioxide. Hydrogen unites with some oxygen to form water, which is excreted in the form of vapor from the lungs, in the perspiration from the skin, and urine from the kidneys, which latter contains also nearly all the nitrogen, most of it in the form of urea. Waste mineral matters are given off to some extent in the perspiration but mainly through the kidneys and intestine. Although sometimes studied by methods of artificial digestion, the digestibility of any food may be most satisfactorily learned by actual tests, the method being, in general, the same as in experiments with animals. (See NUTRITION OF FARM ANIMALS.) From a large number of experiments, it has been calculated that on an average the different groups into which foods may for convenience be divided, have the following coefficients of digestibility:

cated experiments are frequently resorted to. Thus the income and outgo of nitrogen or nitrogen and carbon forms a means of judging of the processes which are going on in the body. Some of the most valuable experiments have been made with a special device called the respiration calorimeter (q.v.), which permits of the measurement of the total income and outgo of matter and energy.

The information gained from a study of the composition and nutritive value of foods may be turned to practical account by using it in planning diets for different individuals or classes of individuals or in estimating the true nutritive value of foods actually consumed by families or individuals, that is, by making dietary studies. The plan followed in making dietary studies which may be of any convenient number of days' duration, is as follows: Exact account is taken of all the food materials (1) on hand at the beginning of the study; (2) purchased during its progress; and (3) remaining at the end. The difference between the third and the sum of the first and second is taken as representing the amounts used. The amounts of nutrients and energy furnished by the total quantity of each food material are calculated through the aid of figures obtained from analyses of samples of the different foods or from tables of average composition like Table I. above. Deducting from the total amounts of the several nutrients and energy, the amounts found in the kitchen and table refuse, the quantities actually consumed are obtained. Account is also taken of the number of meals eaten by different members of the family or group studied and by visitors if there are any. From the total food eaten by all the persons during the entire period, the amount eaten per man per day can be calculated. Observation has shown that as a rule, a woman requires less food than a man and that young children require still less, the amount being dependent upon the age. The amount required by a person varies too with the amount of work performed, more food being evidently needed when a man is engaged at hard labor than when he is idle. The factors which are commonly used in computing the results of dietary studies follow; a man at moderately

TABLE II.—COEFFICIENTS OF DIGESTIBILITY OF NUTRIENTS AND THEIR FUEL VALUE PER POUND IN DIFFERENT GROUPS OF FOOD MATERIALS.

FOOD MATERIAL	Protein		Fat		Carbohydrates	
	Digestibility	Fuel value per pound	Digestibility	Fuel value per pound	Digestibility	Fuel value per pound
	Per cent	Calories	Per cent	Calories	Per cent	Calories
Fish and meats.....	97	1,940	95	4,040	98	1,730
Eggs.....	97	1,980	95	4,090	98	1,730

Vegetable foods (of mixed diet).....	84	1,840	90	3,800	97	1,820
Total food (of mixed diet).....	92	1,820	95	4,050	97	1,820

As a general rule, it may be said that carbohydrates are more completely digested than protein and fat, and that the protein of animal foods, as meat, milk, fish, and eggs is more digestible than that supplied by vegetable foods. In determining the value of food, more compli-

active muscular work being taken as the standard:

FACTORS USED IN CALCULATING THE RESULTS OF DIETARY STUDIES.

Man at hard muscular work needs per meal or per day 1.2 the food of a man at moderately active muscular work.

NUTRITION OF MAN

Man with light muscular work and boy 15-16 years old need, 0.9 the food of a man at moderately active muscular work.

Man at sedentary occupation, woman at moderately active work, boy 13-14, and girl 15-16 years old need 0.8 the food of a man at moderately active muscular work.

Woman at light work, boy 12, and girl 13-14 years old need 0.7 the food of a man at moderately active muscular work.

Boy 10-11 and girl 10-12 need 0.6 the food of a man at moderately active muscular work.

Child 6-9 years old needs 0.5 the food of a man at moderately active muscular work.

From results of many investigations and many physiological experiments, a number of so-called dietary standards have been suggested which are designed to show the amount of nutrients and energy which are required by persons of different occupations and habits of life. The European dietary standards proposed by Voit and the American standards proposed by Atwater, follow:

cooking. In the case of meat, a small part of the loss is due to the escape of meat juices and fat, but the chief loss is simply water. The material removed when meat is boiled need not constitute an actual loss if utilized as soup or gravy. In ordinary meat broth, the substances, with the exception of fat, which are dissolved out of the meat, bones and gristle by the water, consist almost wholly of extractives and salts, which are very agreeable and often most useful as stimulants but have little or no value as actual nutriment. In the case of vegetable foods also, the principal material lost in cooking is water driven off by the heat. If vegetables are boiled some sugar and mineral matter is almost always extracted, but such loss is too small to be very important. Heating often changes the structure of food materials very materially so they may be more easily chewed and more easily and thoroughly digested. In many vegetables,

(*) Fats and carbohydrates in sufficient amounts to furnish, together with the protein, the indicated amount of energy.

Preparation of Food.—The preparation of food has much to do with its nutritive value. Thus, many articles which, owing to their mechanical condition or other cause, are unfit for nourishment when raw, are nutritious and palatable when cooked. It is also a matter of common experience that well cooked food is appetizing and wholesome, while the same material if badly cooked is unpalatable. Cooking is of importance for at least three reasons: It changes the mechanical condition, so that the food material may be acted upon more freely by the digestive juices; it makes it more appetizing by improved appearance or flavor, or both; and it kills by heat disease germs, parasites or dangerous organisms if such be present. Food which is attractive to the taste quickens the flow of saliva and other digestive juices, and thus aids digestion. The cooking of meats develops the pleasing taste and odor of extractives and that due to the browned fat and tissues, and by softening and loosening the protein (gelatinoids) of the connective tissues, makes the meat more tender. Extreme heat, however, tends to coagulate and harden the albuminoids of the lean portions, and also to weaken the flavor of extractives. If the heating is carried too far a burned or charred product of bad flavor results. Quite generally foods lose weight in

the valuable carbohydrates, chiefly microscopic starch grains, are contained in tiny cells with comparatively thick walls on which the digestive juices have little effect. The heat of cooking, especially with the aid of water, ruptures these cell walls and also makes the starch more soluble. The heat also browns or caramelizes a portion of the carbohydrates and produces agreeable flavors in this and other ways.

In the case of breads, cakes, pastry, and other foods prepared from flour, the aim is to make a palatable and light porous food, more easily broken up in the alimentary canal than the raw materials could be. Sometimes this is accomplished simply with the aid of water and heat. In cooking, the heat changes part of the water in the dough into steam, which, in trying to escape, forces the particles of dough apart. The protein (gluten) of the flour stiffens about the tiny bubbles thus formed in the dough and the mass remains porous even after the steam has escaped. More commonly, however, other things are used to "raise" the dough—such as yeast and baking powder. The baking powder when wet gives off the gas carbon dioxide and the yeast causes fermentation in the dough by which the same gas is produced. This gas acts as the steam does, only much more powerfully. When beaten eggs are used to lighten dough, the

albumen encloses air in bubbles which expand, and the walls stiffen with the heat and thus render the food porous. Cleanliness should always be observed in keeping, handling, or serving food. This is required to insure health, as well as for other more obvious reasons. Cleanliness, in this sense, applies not only to freedom from visible dirt, but also from undesirable bacteria, etc.

Cost of Food.—Although the cost of food is one of the chief items in the living expenses of the large majority of the people, very few have any clear ideas regarding the actual nutriment in the different materials they purchase, and too frequently those who wish to economize have little knowledge of the combinations which are best suited to their needs and of the real nutritive value of different foods as related to their cost. In this connection, it is necessary to take into account not only the price per pound, quart or bushel of the different materials, but also the kinds and amounts of nutrients which they contain and their fitness to meet the demand of the body. The cheapest food is that which supplies the most nutriment for the least money, and the most economical food is that which is cheapest and at the same time most adapted to the needs of the hour. It is quite evident that the market price is not regulated by the actual food value. Thus, an ounce of protein or fat from the tenderloin of beef is not more nutritious than that from the round, although it costs considerably more. The attractive appearance of a given food or the buyer's fancy has much to do in regulating the demand and selling price. It is well worth while for housekeepers to become familiar with the true nutritive value of different foods, and to take this into account, as well as flavor, appearance and cost, in the selection of the daily menu.

Diet.—For persons in good health and with good digestion there are two important rules which should be observed in regulating the diet. The first is to select things which agree with the person and avoid those which experience has shown them they cannot digest without harm. The second is to choose such kinds and amounts of food as will supply the materials which the body needs and at the same time will not burden it with superfluous material which must be disposed of at the cost of health and strength. For guidance in this selection, Nature has provided us with instinct and taste which have been trained by experience. Physiological chemistry adds to these the knowledge, still new and not at all adequate, of the composition of food and the laws of nutrition. It is a common practice to be influenced too much by taste, or in other words by the dictates of the palate. Though there may be differences among abnormal persons, for the great majority of people who are in good health, the ordinary food materials such as meat, milk, butter, eggs, cheese, fish, flour, meal, sugar, fruits, potatoes, and other vegetables, make a fitting diet, the main question being to use them in such amounts and proportions as are suited to the actual needs of the body.

Too much food is as bad as too little, and entails a waste of energy as well as a waste of nutritive material. While in the case of some foods purchased, notably meats, more or less waste is unavoidable, the pecuniary loss can be

diminished, both by buying those kinds in which there is the least waste, and by utilizing more carefully than is commonly done, portions which are ordinarily classed as refuse. Then, too, much of the waste may be avoided by carefully planning the diet so as to provide a comfortable and appetizing meal in sufficient amount, but without excess. If strict economy is essential, the dearer cuts of meats and the more expensive fruits and vegetables should be avoided. With reasonable care in cooking and serving, a varied and pleasing diet can undoubtedly be furnished at moderate cost. It must be remembered that the real cheapness or dearthness of a food depends not only on its market price, but also on the cost of its digestible nutrients, and that the ideal diet is that combination of foods which, while imposing the least burden on the body, supplies it with exactly sufficient material to meet its wants, and that the disregard of such a standard must inevitably prevent the best development of our powers.

C. F. LANGWORTHY,

Department of Agriculture, Washington, D. C.

Nuts, hard-shelled fruits, indehiscent, with a hard, dry pericarp, growing on certain trees and bushes in most temperate and tropical regions. The shell, which is often enclosed by woody or leathery husks, does not open of itself when the nut is ripe. Common examples are hazel and hickory nuts. Peanuts and other ground nuts properly belong to another class of fruits. The more important nuts may be divided into two classes: (1) those used for food, and (2) those used for oil, dyeing, and other purposes, medicinal, ornamental, and commercial.

The principal kinds of edible nuts are sweet and bitter almonds (*Amygdalus communis*), native to Asia Minor, northern Africa, southern Europe, and successfully cultivated in California; Brazil-nuts, or nigger-toes, the seeds of a majestic tree (*Bertholletia excelsa*), whose habitat is Venezuela and northern Brazil; bread-nuts growing on a tree (*Brosimum alicatum*) of Jamaica; several varieties of chestnuts, the American (*Castanea americana*) in the Eastern and Southern States, the Spanish (*Castanea sativa*) in southern Europe, northern Africa, and western Asia, also species found in Australia and Tahiti; cocoanuts, the fruits of the coconut palm (*Cocos nucifera*) in the East Indies, West Indies, Florida, South America, and Hawaii; cola, or kola, nuts, the seeds of a tree (*Cola acuminata*) native to West Africa and cultivated in tropical America; hazelnuts, filberts, or cobnuts (*Corylus avellana*) in England, Spain, Sicily, and other parts of Europe, also the American hazel (*C. americana*) and the California hazel; hickory nuts (*Carya alba* and other species) in the United States (from Maine to Texas), and Mexico; pecans (*Carya oliviformis*), in Indian Territory, Texas, Louisiana, and other southern States; pistachios or green almonds (*Pistacia vera*), found in southern Europe, southwestern Asia, and northern Africa; souari or suwarrow nuts (*Caryocarpus nuciferum*), also called the butternut of Demerara, native to Brazil and Guiana; walnuts (*Juglans regia*), commonly named English or Persian walnuts and Madeira-nuts, in Asia, Europe, Chile, and California, also the black

NUTS

walnut (*J. nigra*) and the white walnut (*J. cinerea*) or butternut of the United States.

Certain edible nuts are used as sources of oil. The principal kinds are the almond (sweet and bitter), the ben nut of the East Indies, the candle nut of the South Sea Islands, the cashew-nut of the West Indies, the coconut of the East Indies, the dika nut of West Africa, the palm nut of West Africa, the pine nuts of Europe and Asia, the physic nut (*Carcas purgans*) of tropical America, the English walnut and the American butternut.

Of nuts having medicinal qualities are the seeds of *Strychnos nux-vomica*, of southern Asia and the East Indies, from which the poisonous drug nux-vomica is obtained, and the betel nuts, fruit of the areca palm (*Areca catechu*), in the East Indies and the Philippines, used as a vermifuge, also said to have stimulant and tonic properties. Some kinds of nuts are turned to account for various practical and ornamental purposes. The boomah nut (*Pycnosoma macrophylla*), of Africa, is used for tanning; nut galls (*Quercus infectoria*), of the Levant, for dyeing and ink-making; soap-nuts (*Sapindus saponaria*), of the West Indies, in washing. The horse chestnut (*Esculus hippocastanum*), of Europe, contains starch. The cumara nut (*Dipteris odorata*), of Brazil, is valuable for its perfume. The saffraas nut (*Neeltandra pachyrrhiza*), of Brazil, is used in flavoring chocolate. Ravensara nuts, also called the Madagascar clove nutmeg, are useful for seasoning. Many species of nuts are prized as ornaments. Betel nuts are utilized as coat buttons; bladder nuts (*Staphylea pinnata*), of Central Europe, are worn as beads in necklaces; also the bonduc nut (*Guilandina bonduc*), of India, and the grugru nut (*Acrocomia schlerocarpa*), of South America, are used as beads. The corozo nut or vegetable ivory, of Brazil and Colombia, is made into toys, and the coquilla nut (*Attalea funifera*), of Brazil, is valuable for decorative turnery.

The demand for nuts as an article of commerce is constantly growing. The value of nuts, domestic and foreign, annually marketed in the United States, is about \$7,000,000. The consumption of home-grown nuts cannot be accurately estimated. The yearly exports of domestic nuts amount to \$300,000, of which pecans (the most important of native nuts) form a considerable item. Imports during the fiscal year 1902-3 amounted to nearly \$5,000,000, the bulk being of three kinds: almonds (\$1,337,717), walnuts (\$1,106,033), and coconuts (\$908,248). The most popular varieties of almonds are from Tarragona and Iwica, Spain, and from Formigetta, France. Shelled almonds, which are largely used by confectioners, for the most part come from Spain, Sicily, and Italy. The walnuts from Grenoble, France, are said to be the best, and those from Naples have a fine flavor. Importations of coconuts are chiefly from South America and the West Indies. Of other nuts, filberts or hazels come principally from Italy, Sicily, and Spain, chestnuts from France and Italy, and Brazils from South America.

Recent experiments tend to show that the food value of nuts is much greater than was formerly supposed. Many savages and wild animals depend largely upon nuts for sustenance through long periods of the year. According to

a missionary of the Kongo, the natives subsisted almost entirely upon cola nuts during a famine lasting months. Among civilized people nuts have been looked upon as accompaniments to a feast, promoting cheerfulness and pleasant talk. They serve this purpose and more, for as sources of protein and fat they furnish considerable nutritive material and energy. Where other provisions are deficient in protein or albuminoids and fat, almonds and walnuts supply this lack. The chestnut may be used as a substitute for the cereals, because of its high proportion of starch, sugar, and dextrin. In some parts of Asia nut oil is used considerably in cooking.

Almonds, Brazilnuts, filberts, hickory nuts, pecans, walnuts, chestnuts, and other nuts contain in concentrated form a great deal of nourishment. When bought at ordinary prices, they should not be considered luxuries but fairly economical articles of diet. Investigations carried on at the Agricultural Experiment Station of the University of California in 1901-2 emphasize the fact that nuts are to be regarded as true foods rather than food accessories.

Samples are selected from Woods and Merrill's analyses of nuts. The edible portion of almonds contains: water, 6 per cent; protein, 23.5; fat, 53; carbohydrates, 7; ash, 3.9; fuel value per pound, 3,329 calories. Almonds are generally eaten as dessert, as is the Brazilnut, whose edible portion contains: water, 5.3; protein, 17; fat, 66.8; carbohydrates, 7; ash, 3.9; fuel value per pound, 3,329. The chestnut (Spanish, dry) contains: water, 6.6; protein, 9; fat, 6.6; carbohydrates, 75; ash, 2.8. The chestnut is widely grown in France, where large quantities are used as food by both poor and well-to-do classes. Dried chestnuts are ground to flour and baked in cakes. In Italy the chestnut is eaten fresh, boiled, and roasted, also in the form of porridge. Chestnut cake is a common delicacy among the peasants of the Apennines. In Korea the chestnut practically serves as a substitute for the potato, being cooked in several ways. In some countries chestnuts are used for fattening hogs and other animals. The edible portion of the filbert contains: water, 3.7; protein, 15.6; fat, 65.3; carbohydrates, 13; ash, 2.4; fuel value per pound, 3,432. The filbert is eaten chiefly as a dessert in England and America. In some countries of Europe it is often roasted, and it is sometimes ground to a flour and made into bread. It is grown in enormous quantities about Trebizond. The fruit of the shag-bark hickory is a great favorite with Americans. The edible portion of the hickory nut contains: water, 3.7; protein, 15.4; fat, 67.4; carbohydrates, 11.4; ash, 2.1; fuel value, 3,405. The pecan (*Hicoria pecan*) is the most popular of American nuts. The edible portion of the pecan contains: water, 3; protein, 11; fat, 71.2; carbohydrates, 13.3; ash, 1.5; fuel value per pound, 3,633. The English walnut ranks next to almonds in popularity. In Korea it is a regular article of diet. The edible portion of the walnut (Italian, *J. regia*) contains water, 4; protein, 16.9; fat, 68; carbohydrates, 9; ash, 2; fuel value per pound, 3,558. As there is practically no refuse in the composition of nuts, other food substances having bulk should be eaten with them. Vegetarians point to the linch, active squirrel and recommend the eating of nuts for

NUTT—NYAN

reducing the abdomen and increasing agility. The fact that Americans do not appreciate the food value of nuts as much as Europeans and Asiatics do, is attributed to the abundance of fruits and cereals in this country. The increasing demand, however, is encouraging nut culture in California and other States. The number of nut-trees and their products in the United States as reported by the Twelfth census was as follows:

	Trees	
Almond	1,649,073	7,142,710 lbs.
Cocanut	48,919	145,000
Pecan	643,292	3,206,850 lbs.
Persian English Walnut...	726,798	10,668,065 lbs.
Miscellaneous nuts	834,460	380,224 bu.
Value of all nuts.....		\$1,959,161

EUGENE PARSONS,
Author and Editor.

Nutt, nūt, Alfred Trubner, English folklore scholar: b. London 22 Nov. 1856. His education was obtained at University College School and the Collège de Vitry François, and after serving from 1874 a three-years' apprenticeship in the book publishing business on the Continent, succeeded to that of his father, David Nutt, in London, in 1877. He joined the Folk Lore Society soon after and was elected its president in 1897. He founded the English Goethe Society in 1886 and was one of the founders of the Irish Texts Societies in 1898. He has written 'The Legend of the Holy Grail with Especial Reference to the Hypothesis of its Celtic Origin' (1888); 'The Voyage of Bran' (1895-7).

Nuttall, nūt'al, Thomas, English-American naturalist: b. Long Preston, Settle, Yorkshire, England, 5 Jan. 1786; d. Nutgrove, near St. Helens, Lancashire, England, 10 Sept. 1859. He learned printing, came to the United States in 1807; traveled widely; made numerous discoveries in botany; ascended the Missouri River in 1811, the Arkansas in 1819, and in 1825-34 was professor of natural history and curator of the botanic gardens at Harvard. In 1834 he explored the Oregon and Upper California. From 1842 he resided in England. Among his publications were: 'The Genera of North American Plants' (1818); 'A Journal of Travels into the Arkansas Territory' (1821); 'Introduction to Systematic and Physiological Botany' (1827); 'A Manual of the Ornithology of the United States and Canada' (1834); and 'The North American Sylva: Trees not Described by F. A. Michaux' (1842-9).

Nutting, nūt'ing, Mary Olivia, American writer: b. Randolph Centre, Vt., 1 July 1831. She was graduated from Mount Holyoke Seminary (now College) in 1851, taught there 1853-70, was librarian of the institution 1870-1901, and since the last-named date, libra-

rian emeritus. She has published 'Steps in the Upward Way' (1867); 'Our Summer at Hill-side Farm' (1867); 'The Story of William the Silent' (1869); 'The Days of Prince Maurice' (1894); etc.

Nux Vom'ica, the popular name for the seeds of a tree (*Strychnos nux-vomica*) of the natural order *Loganiaceæ*. The tree is a native of Ceylon, Coromandel, and other parts of southern Asia. It is of medium size, bears oblong, entire smooth leaves, and flowers in terminal corymbs, followed by one-celled berries as large as oranges. They have brittle shells, white gelatinous pulp, and flat, disk-like hairy gray seeds which are tough, odorless, and very bitter. The pulp is a favorite food of many birds. The seeds have long been used in pharmacy and medicine, and are of great value, being the source of the alkaloids strychnin and brucin. Under the name false Angostura bark the bark of this tree has been used to adulterate the true Angostura bark, from which it differs in its properties.

Nyack, nī'āk, N. Y., village in Rockland County; on the Hudson River, where the expansion is called Tappan Bay, and on a branch of the Erie Railroad. It is connected by ferry with Tarrytown on the opposite side of the Hudson, and it is about 26 miles from the Grand Central Station in New York. It was settled in 1700, incorporated as a village in 1873, gave up its charter in 1876, and was again incorporated in 1883. It is a beautiful residential village, but has some manufacturing. The chief industrial establishments are boot and shoe factories, wagon, carriage, and sleigh factory, yacht, boat-building, and cloth finishing works. For many years it has been an educational centre; it is the seat of the Nyack Military Academy, the Hudson River Military Academy, and the Rockland Military Academy. It has public and parish schools, a public library, and several good church buildings, notably Saint Ann's (R. C.), the interior of which is beautifully decorated. The village owns and operates the waterworks. Pop. (1910) 4,619.

Nyam-Nyam, nyām-nyām', Niam-Niam, or Zandeh, an African nation, composed of numerous petty tribes dwelling in the basins of the Shari and Welle rivers. They number upward of 2,000,000. They are a branch of the Sandeh tribes, who all belong to the stock of the negroid Nubas. The men devote themselves to hunting and war; the women cultivate the fields and eleusine, manioc, sweet potato, gourds, yam, banana, etc. These with game are the chief food, though a portion of the people are notorious cannibals. They have no cattle. Considerable manual and artistic skill is shown in the forging of iron, making of pottery and baskets, and the carving of wood. They are passionately fond of music, and play a kind of mandolin. Polygamy prevails. The weapons are spears, knives, a species of iron boomerang, and shields.

Nyan, nī-ān', a large wild sheep (*Ovis hodgsoni*) of the Tibetan Mountains, with great spiral horns on the head of the ram, and yielding excellent mutton. It is called argali by British sportsmen, and is one of the prizes of the chase in the Himalayan region.

NYANGWE — NYMPHS

Nyangwe, nyāng'wě, Africa, a trading station in the Kongo Free State, on the Kongo River; lat. 4° 15' S.; lon. 26° 20' E. In 1871 it was visited by Livingston, and in 1876 Stanley made the place his headquarters while exploring the Upper Kongo. It is connected by road with Albertville on Lake Tanganyika. By caravan route, rivers, and steam cars from Leopoldville connections exist with the Atlantic.

Nyanza, nyān'zā, a Bantu word meaning "great water." It is used as the English word "lake" in connection with the names of three large bodies of water in Central Africa: as, Albert Nyanza, Victoria Nyanza, and Albert Edward Nyanza.

Nyassa, nyās'sā or nyās'sā (from the Bantu word *nyasa*, that is, "great water"), a lake in southeastern Africa, nearly 400 miles from the Indian Ocean, and west of German East Africa. It extends north and south about 350 miles, and east and west from 20 to 50 miles; area, about 14,300 square miles. It is about 700 feet deep at its southern point, but to north, or its source, it is quite shallow. Toward the south the bed sinks below the level of the Indian Ocean, and at its head the surface is over 1,000 feet above the ocean level. The outlet is Shiré River, which flows south into the Zambesi. With the exception of Murchison Falls and Rapids, 70 miles long, in the Shiré River, there exists unbroken water communication between the head of Nyassa and the Indian Ocean. The African Lake Company have launched steamers on the lake, investigated the coast, and made a road from the north end of the lake up the heights to the plateau between Nyassa and Tanganyika (q.v.). Another road has been made around the rapids in the Shiré River. On the west and east coasts are mountains, those on the east are from 4,000 to 11,000 feet in height. In some places low sandy land extends between the water and the mountain, and in other parts, as at the north, the mountains come down to the water. A number of rivers flow into the lake from the west; they have broken through the mountain barrier. Livingstonia (q.v.) on the south, Bandawé on the west, and a number of other small villages or hamlets have been established along the coast.

Nyāya, nyā'ya. See HINDUISM.

Nyc'tipithe'cus. See DOUBODOULL.

Nyd'ia, a character in Bulwer's 'Last Days of Pompeii.' She is a blind flower girl, of good birth, rescued from slavery by the hero.

Nye, nī, Edgar Wilson, American humorist: b. Shirley, Maine, 25 Aug. 1850; d. near Asheville, N. C., 22 Feb. 1896. He removed when a young man to Wyoming Territory; studied law, and was admitted to the bar in 1876. Subsequently he made his home in New York and became widely known as a humorous lecturer and writer under the pseudonym of "Bill Nye." He was the author of 'Bill Nye and Boomerang' (1881); 'Forty Liars' (1883); 'Remarks' (1886); 'Fun, Wit, and Humor' (1889), with J. W. Riley; 'Comic History of the United States' (1894); 'Comic History of England' (1896); 'Baled Hay'; etc.

Nyeshin, nyē'zhēn. See NIZHAN.

Nyiregyháza, nyē-rēd-y-hā'zō, Austria-Hungary, town in the district of Szabolcs; on the Nyir River, and at the junction of two railroads, about 170 miles by rail northeast of Budapest. It is in a productive agricultural region in which wheat, grapes, and a variety of fruits grow luxuriantly. It is in the vicinity of the Tokay wine region. There are a number of manufacturing industries, among which are the manufacturing of matches, soda, and saltpeter.

Nyköping, nū'hē-pīng, Sweden, seaport, on a bay of the Baltic Sea; about 60 miles southwest of Stockholm. In the 13th century this was one of the most important places in Sweden. The castle, now a ruin, ranked in strength with those of Stockholm and Calmar. In 1719 the town was captured and nearly destroyed by the Russians. It has regular steamer communications with Stockholm and other ports, and is of considerable manufacturing and commercial importance.

Nyl'ghau. See NILGAI.

Nym Crin'kle. See WHEELER, ANDREW CARPENTER.

Nymph. See PUPA.

Nympha'cea, an order of aquatic plants, the water-lilies. They are generally large, floating on the surface of the water, and having a stem which forms a subterranean creeping shoot. The flowers are very large, solitary, with cylindrical peduncles as long as the petioles of the leaves; the perianth is colored, petaloid, composed of a great number of petals, arranged in several rows, and often inserted, as well as the stamens, in the lower part of the sides of the ovary; the outermost of these petals seem to constitute a calyx, while those within form a kind of corolla. The stamens are very numerous; the anthers are turned toward the centre of the flower. The ovary is simple, covered almost throughout by the perianth-segments and by the stamens; it is globular, with several cells, each containing a great number of ovules; the stigma is radiated, peltate, sessile. The fruit is globular, resembling externally a poppy capsule, indehiscent, fleshy within, divided into a great number of cells containing seeds immersed in a fleshy pulp. This order furnishes one of the best examples of the gradual passage of petals into stamens and of sepals into petals; the transition is so insensible that many intermediate bodies are neither precisely petals nor precisely stamens, but part of both. The principal genera of the order are *Euryale*, *Victoria*, *Nymphaea*, and *Nuphar*. See LOTUS; VICTORIA REGIA; WATER-LILY.

Nymphs, in Greek mythology, youthful goddesses of inferior rank to the other divinities who dwelt in Olympus. Begotten by Oceanus, or by Zeus and others, they preserve and nourish the woods, rivers, springs, and mountains. They are therefore distinguished according to their offices, as Oceanides, nymphs of the ocean, regarded as daughters of Oceanus; Nereides, or nymphs of the Mediterranean, who were regarded as daughters of Nereus; Leimonides, or nymphs of the meadows; Dryades or Hamadryades, or nymphs of trees, whose lives were regarded as beginning and ending with those of the trees with which they were asso-

NYORO—NYX

ciated; Melides, or nymphs of fruit-trees; Oreades or Orestiades, or nymphs of mountains and grottoes: these, dressed lightly, as huntresses, were the companions of Artemis (Diana), who was herself originally an Arcadian nymph; there were also Naiades, who presided over fountains, Potamides over rivers, and Limniades over lakes. The nymphs hold a middle station between gods and mortals, and, without being immortal, yet live longer than is permitted to man. At their death the substance which they have supplied with nourishing moisture perishes also. This first notion of nourishment, which is supposed in the very idea of a nymph, seems to have given origin to the second representation of them as nurses of young children entrusted to their care.

Nyoro, nyō'rō, a Bantu tribe living on the shores of Lake Albert Edward, in Africa. As a race they are well built, tall and good-looking. They live in cone-shaped, thatched huts and make dugout canoes and rafts. They lived principally on sweet potatoes, fish and game. They are said to number about 125,000.

Nyrén, nū-rän', **Magnus**, Swedish astronomer: b. Wermland, Sweden, 21 Feb. 1837. He was educated at Upsala and became an instructor in the Pulkova Observatory in 1868. His astronomical researches have been of great value and he was made vice-director of the Observatory at Pulkova in 1890. He has published: 'Bestimmung der Nutation der Erdschse' (1873); 'Variations de la latitude de Poulkova' (1893); etc.

Nys'sa, a genus of trees. See **TUPelo**.

Nystag'mus, involuntary motion of the eyeballs. The movement is usually lateral, but is sometimes rotatory, and in rare cases vertical. It may be induced by inflammation and other disorders of the eyes, and in miners is not infrequently caused by long-continued work underground in obscure light. Very little in the way of cure is possible.

Nyx, nīks, in Greek mythology, the goddess of night or darkness. She was the daughter of Chaos. Her brother was Erebus.

O

O the fifteenth letter and the fourth vowel of the English alphabet. Its form may have been suggested by that assumed by the lips in producing the sound. It is called the labial vowel because of the part the lips have in its pronunciation: for analogous reasons the third vowel *i* (ee) is called the palatal and *a* (ah) the guttural vowel. In early Latin writing the *o* was square ◊. In the Greek alphabet there are two characters to represent this vowel, namely, great *o* (omega, Ω, ω) and little *o* (omicron, Ο, ο). The vowel sounds in our language which are represented by *o* are numerous, namely, (1) The sound it has in *oh*, *lo*, *cone*: this is the regular, long sound of *o*, and it is common to English with most other languages. Curiously, English seems to lack the short vowel sound corresponding to this long *o*: what is usually called the short *o*, the vowel sound in *on*, *odd*, *log*, is not the *o* of *long* shortened, but rather the sound of *e* in *all* shortened. But though orthoepists hold that the true short open vowel sound of *e* is unknown in English, natives of New England almost invariably in many words shorten the open *o* (as in *go*) without changing its quality; in their pronunciation of *bone*, *home*, *coat*, *load*, etc., the vowel is the true *o* shortened. This short *o* is not recognized by Alexander J. Ellis as an English vowel sound. The editors of Webster's Dictionary (edition of 1879) remark of this local pronunciation that "its rise and growth are interesting facts, and its final prevalence is a thing he (the theoretic phonologist) would rather desire than deprecate." The long *o* sound is variously represented in English; by *o* (*lo*), by *ow* (*low*), by *au* (*hautboy*), by *eau* (*beau*), by *eo* (*yeoman*), by *ew* (*sew*), by *oa* (*roam*), by *oe* (*hoe*), by *oo* (*door*), by *ough* (*dough*), by *ou* (*shoulder*), and by *oue*. (2) The vowel sound commonly called short *o*, as in *odd*, *cob*, is really, as we have seen, the shortened vowel sound represented by *e* in *all*, *fall*. (3) The obscure short vowel sound heard in *done*, *son*, *ton*; this sound is usually represented by *u*, as in *dun*, *sun*, *ton*. (4) The sound of *u* in *run*, for example, *move*, *prove*. (5) The same sound shortened, as in *wolf*, *woman*; the vowel sounds 4 and 5 are the sounds of the fifth vowel in a standard alphabet. (6) The sound usually rendered by broad *a* in *all*, *call*: examples, *order*, *former*, *north*.

O', in Irish proper names, a patronymic prefix corresponding to the Mac of the Highlands of Scotland; thus *O'Connell* means "the son of Connell." It is supposed to be a corruption of the Irish *ua* (Gaelic, *ogha*), meaning a grandson.

O. P. Riots, or Old Price Riots, a public disturbance in London in 1809, occasioned by the opening of the New Covent Garden Theatre. The management increased the prices of admission, and the crowd mobbed the theatre demanding that the old tariff for admission be retained.

Oahu, *ô-â'ho* or *ô-wi'ho*, one of the Hawaiian Islands, the northernmost large island of the group; length 38 miles, average width about 20 miles. It has an irregular coast line, several small harbors, one excellent harbor on the west coast, upon which Honolulu (q.v.), the capital of Hawaii is situated. Two mountain ranges cross the island, and between is a large dry plain which is productive when irrigated. Mount Kaala, 3,890 feet, is the highest point on the island.

Oak, a genus (*Quercus*) of trees and shrubs of the order *Cupulifera*. The species, of which there are about 300, are characterized by alternate simple deciduous or evergreen leaves, inconspicuous monoecious flowers, the staminate, usually in slender pendulous catkins, the pistillate usually nearly sessile and generally solitary or in groups of two or three and developing into "acorns" which are more or less globular or oblong nuts set in the hardened, scaly involucre (cups) which sometimes nearly surround them. Nearly all the species are natives of the northern hemisphere, especially the temperate and colder portions in the latter, of which even the larger species, when present, become reduced to mere shrubs, a peculiarity also exhibited in very sandy, dry or rocky soils. Some species are natives of the warmer parts of the temperate zone, but few are actually tropical. Most of the oaks are noted for strength, durability, longevity and striking individuality of appearance; and on account of these qualities they have been used as symbols by many races, and enter into literature and tradition. Some of the species reach maturity only when 50 to 100 years old, and others even exceed this maximum before reaching a size suitable for lumbermen's purposes. Specimens are known which have reached nearly 1,000 years, and others of half that age are common.

Oaks are generally propagated by seeds planted as soon as mature in the autumn; choice varieties are grafted or budded; and evergreen species are often increased by means of cuttings or layers. In general they thrive best upon well drained, fairly moist, loamy soils, especially such as are well supplied with lime. They are, however, found in all kinds of habitats, including almost pure sand, clay, rocky mountain sides and the mucky soils of undrained swamps. With few exceptions the valuable species are easily grown and readily transplanted while young.

OAK APPLE—OAK GROVE

Among the oaks are some of the most valuable trees of the Temperate zone. Their acorns furnish a valuable food for swine, and in some instances are used for human food; their bark is one of the most important barks used in tanning; and their timber, which is noted for its solidity, strength, resistance to moisture, and durability, is one of the most important woods of the world. It is used largely in ship-building, but less now than before the introduction of iron and steel vessels; in railroad and mill construction, bridge building, etc.; and, because of its handsome graining and its ability to receive polish, it is extensively employed in interior finish of houses, in furniture, etc. The galls which grow upon certain species and the bark are widely used as a source of tannin for ink manufacture. Some of the more rapidly growing species are planted largely in Europe in copses, the stems being cut every few years for fuel and for the bark. Few trees are more highly prized by horticulturists and landscape gardeners; but usually the specimens must be in place before the gardener lays out the ground because with most species little effect can be expected under ten years. For this reason other trees of quicker growth are planted with oaks and are removed when the oaks need the space.

About 50 species and half as many hybrids and varieties are natives of the United States, some extending from Nova Scotia to Minnesota and southward to the Gulf States, others being limited to very restricted localities. In general these species belong to two groups, the black oaks and the white oaks. Those of the first group have leaves with pointed tips and acorns that require two years to reach maturity; those of the second have leaves with round lobes and acorns which reach maturity the first year. The most important species is probably the white oak (*Quercus alba*) which has the full range mentioned above. It attains a height of 100 feet, has broadly spreading branches which form an open rounded head, and the light gray bark which gives it its name. It is one of the handsomest of its genus, and being of rather quick growth for an oak, and remarkable for its statelyness, it is often planted in parks. Its timber being compact and remarkably handsome is one of the most prized for furniture. The mossy-cup or bur oak (*Q. macrocarpa*) resembles the white oak in size, appearance and distribution, but its timber, being of coarser grain, is less valued. The chestnut-oak (*Q. prinus*) is a smaller tree, with a broad irregular head and dark brown bark deeply furrowed, and with leaves like those of the chestnut. It ranges from Nova Scotia to Alaska and southward to southern Michigan, Ontario, and Pennsylvania. It is especially valued for its bark, which is exceptionally rich in tannin. The live oak (*Q. virginiana*) is a broadly spreading tree, seldom more than 60 feet tall. It is noted throughout its range, which extends from Virginia southward, for its glossy, dark green leaves and its dense shade, for which it is widely planted in the South for ornament. It is usually draped with Spanish or Florida moss (*Tillandsia*) which also adds to its striking appearance. The red oak (*Q. rubra*) which has a range similar to the white oak, is a rapidly growing, handsome tree sometimes reaching 150 feet and forming a broad round head. Its timber is very heavy, durable and hard, but is coarse-grained. It is

less used for the finer work than the white oak. A close relative, the scarlet oak (*Q. coccinea*), is smaller than the preceding, but is similar in range, uses, etc. Both kinds are remarkable for their autumn colors. The water-oak (*Q. nigra*, popularly known as *Q. aquatica*) is common from Delaware southward to the Gulf States. It attains a height of 80 feet, and being of rapid growth it is frequently planted as a street tree in the South. In the North it is not hardy.

The European or British oak (*Q. robur*) has two well marked botanical varieties, one with stemless acorns, the other with acorns on stems. It is a native of western Asia and northern Africa as well as of Europe. About 50 horticultural varieties of this species are in cultivation for ornament, some being introduced into America for this purpose. This is the oak of legendary lore, under whose branches the ancient Druids held their religious ceremonies. It is also the oak used by the navies of Europe for more than a thousand years. The cork-oak (*Q. pseudo-suber*) is a native of the Mediterranean region and is noted for its bark which furnishes the cork of commerce. The gall-oak (*Q. lusitanica*) is a shrub, native to western Asia, and is chiefly useful for its nut-galls (q.v.) which occur upon the leaves as the result of insect attack. The Valonia oak (*Q. argilops*) common in the same region, is noted for the astringency of its acorns, which are largely used in tanning. The holm, holly or evergreen oak (*Q. ilex*) is a native of southern Europe, and bears acorns used for food.

A very large number of insects live upon the oak, its timber and its decaying wood. One estimate for the United States places this at 1,000; the number actually recorded being between 500 and 600. In Germany, according to Kaltenbach, there are 537. These belong to all orders and include borers, leaf-chewers, sap-suckers, and fruit-eaters. Among the most noted are the oak-tree pruner (*Elaphidion villorum*), a beetle which lays its eggs in the twigs, in the pith of which the larvae feed until nearly mature, when they chew out a ring of wood nearly to the bark, retire to the semi-severed twig, plug up the burrow and pupate. The wind snaps the twig; hence the name. Many gall-forming insects, plant-lice, leaf-miners, scale-insects and leaf-rollers, feed upon the leaves, which are also often attacked to a damaging extent by the larvae of numerous lepidopterous insects. Some of the curculios are frequent pests upon the acorns, which are rendered useless for stock food, because their contents have been eaten by the larvae. Perhaps the most serious pests, however, are the borers, of which there are a large number. These may retard the development of the trees or may so injure the wood by their burrows as to make it unfit for purposes where strength and appearance are necessary. Consult: Packard, 'Fifth Report, United States Entomological Commission' (Washington, 1890).

Oak Apple, any large gall (q.v.) on an oak; specifically, in England, a spongy excrescence on the twigs of *Quercus pedunculata*.

Oak Crown, Order of the. See **ORDERS AND DECORATIONS**.

Oak Grove, Battle of. After the battle of Fair Oaks or Seven Pines (q.v.) 31 May-1 June 1862, Gen. McClellan remained inactive

OAKELEY—OAKLAND

astride the Chickahominy, his advance but five miles from Richmond. In the last week of June Fitz-John Porter's corps of two divisions, with McCall's division, temporarily attached, was on the left bank of the Chickahominy, and held the right of the line. Next on the left, across the stream, was Franklin's corps of two divisions, and on Franklin's left, in the order named, Sumner's and Heintzelman's corps, of two divisions each. Keyes' corps, of two divisions, was in reserve. The effective strength of the army was 92,500, and McClellan was daily calling for more. Lee, including Jackson's command, which was near, stood between him and Richmond with 80,000 men. The bridges being repaired and the ground firm, McClellan, 25 June, determined to advance the left of his picket-line preparatory to a general forward movement. Immediately in front of the most advanced redoubt on the Williamsburg road was a large open field, beyond which was a swampy belt of timber of some 500 to 700 yards, which had been disputed ground for many days. Further in advance was an open field, crossed by the Williamsburg road and the railroad, and commanded by a Confederate redoubt and rifle-pits. It was McClellan's intention to push his lines through these woods in order to ascertain the nature of the ground, and to place Heintzelman and Sumner in position to support an attack to be made by Franklin on the 26th, on the rear of Old Tavern, and which, if successful, would force Lee from the heights overlooking Mechanicsville and clear the way for a general advance on Richmond. The movement began about 9 A.M. by the advance of Hooker's division of Heintzelman's corps on both sides of the Williamsburg road, where a mile separated the Union and Confederate works. Hooker was supported by Kearny's division on the left, and on the right by Richardson's division of Sumner's corps. The Confederate pickets were driven in, and Hooker struck Wright's and Armistead's brigades of Huger's division, which, with a part of Ransom's brigade, made a stubborn resistance, and at 11 A.M., after Hooker on the right had advanced some 800 yards and Kearny nearly a mile, the entire Union line was ordered to fall back; Kearny, however, held on to the ground won. At 1 P.M. McClellan came upon the field and ordered a renewal of the advance. Hooker was reinforced by a brigade of Couch's division, and advanced; Kearny joined in on his left. Mahone's brigade and the rest of Ransom's reinforced the Confederates, and a severe fight ensued, lasting until dark. McClellan says he accomplished his object. The Confederates claim that McClellan was repulsed and gained no material advantage, and that at night they occupied their old positions. This battle, also known as that of Kings school-house, French's Fields, and the Orchards, was the beginning of the Seven Days' Battles (q.v.). The Union loss was 67 killed, 504 wounded, and 55 missing. The Confederate reports show a total loss of 441. Consult: 'Official Records,' Vol. XI.; Webb, 'The Peninsula'; Allan, 'History of the Army of Northern Virginia'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. CARMAN.

Oakeley, Sir Herbert Stanley, English composer: b. Ealing 22 July 1830; d. November

1903. He was educated at Rugby, and at Christ Church, Oxford, studied music in England and at the Leipsic Conservatory under Moscheles and Plaidy, and later devoted himself to the organ, working with Breidenstein in Bonn and with Schneider in Dresden. In 1858-66 he was musical critic to the 'Guardian,' in 1865-91 professor of music at Edinburgh, and for many years composer to the Queen in Scotland. In Scotland he furthered orchestral and organ music, and established Students' Choral Associations in the universities. His compositions are principally religious, including anthems, cantatas, hymn tunes, chants, and service-music; but he also wrote some pieces for the piano-forte.

Oaken Crown, Order of the. See OAKS, ROYAL.

Oakes, 8ks, Urian, American colonial scholar and clergyman, 4th president of Harvard College: b. England 1631; d. Cambridge, Mass., 25 July 1681. He was brought to America in 1634, showed himself an able mathematician and astronomer when a mere boy, was graduated at Harvard in 1649, studied theology, preached for several years in England, and in 1671 became pastor of the church in Cambridge and fellow of Harvard College. His ambition is supposed to have urged him to rouse dissension against President Hoar, upon whose resignation in 1674 he became acting president, being inaugurated in 1680. He wrote much Latin verse and a famous 'Elegy upon the Death of Thomas Shephard,' selections from which may be found in Tyler, 'History of American Literature.'

Oakland, 8k'land, Cal., city, county-seat of Alameda County; on the San Francisco Bay, and on the Southern P., the Santa Fé, and the Western P. R.R.'s; across the bay from San Francisco, and at the centre of the coast-line of the State. It is connected by the electric railway system with the chief towns and villages of the county, and with a number of places along the coast. The land-locked harbor, six miles along the southern front of the city, can accommodate the largest ocean vessels. The city has 15 miles of water-frontage. The jetties erected by the Federal Government in the western part of the harbor have greatly increased traffic. The high-tide jetties, forming the harbor entrance, are built of rubble stone. The South Pacific Coast Railway has built a solid mole alongside the south jetty.

Oakland is walled on the north and east by the Coast Range, and the city slopes down to the bay, making a location of great scenic beauty, forming an almost perfect natural drainage, and so protecting the city from cold but not cool breezes as to give an ideal climate. The mean temperature for the years 1880 to 1904, was 52° F. It was settled in 1820 by Don Luis Maria Peralta and other Spaniards, was incorporated in 1852, and chartered as a city in 1854. It is the commercial centre of a large agricultural region, and its excellent facilities for transportation (ships and cars meet at the water-side) are greatly increasing the amount of its shipments each year. Its chief industrial wealth is derived from its manufactures, shipping, and the agricultural products of the county. The principal industrial establishments are iron works, which have 800 employees; ship-

building works, 700 employees; canneries, over 4,000; flour mills, 150; candy factories, 200; gas works, 250; planing mills, 650; and lumber yards, 375. There are in the employ of building contractors over 2,000 men; the paving companies have about 350 employees; the coal and grain handlers number about 175, and the water company has 250 employees, the street railroads, 900; and other industries of the city have in all 17,941 employees. The annual wages paid to the employees of industrial establishments is about \$10,302,000. Some of the prominent buildings are the post-office, banks, hospitals, Home for the Blind, Y. M. C. A. and Y. W. C. A. buildings, theatre, Saint Joseph's Home for Deaf Mutes, the church, school, and library buildings. The educational institutions are 19 public and 10 parish schools, California College (Baptist), Saint Mary's College (R.C.), Saint Joseph's Academy (R.C.), Our Lady of Lourdes Academy (R.C.), a public library which contains nearly 40,000 volumes and is housed in a Carnegie building which cost \$50,000, on a site that cost \$20,000. Connected with the public high school is a well equipped observatory. Berkeley (q.v.), which is the seat of the University of California, adjoins Oakland, on the north. There are eight public parks, and a water park in which at the base of the foothills and within 10 minutes' walk of the centre of the city is Lake Merritt, a natural salt-water lake of 170 acres, whose waters are replenished with every tide. The nine banks have a combined capital of over \$3,000,000 and deposits of over \$25,000,000. In August, 1911, Oakland was one of eight cities in California having commission government. Berkeley on the north, Alameda on the southwest, and a number of smaller adjoining places are practically one with Oakland commercially, but each has a separate municipality. Pop. (1880) 34,555; (1890) 48,682; (1900) 66,900; (1910) 150,174.

EDWIN STANTON,

Secretary Oakland Board of Trade.

Oak'um, in shipbuilding, threads of hempen ropes picked to pieces, to be used when mixed with pitch for caulking the seams of wooden vessels. Until recently old men, women, and children were employed to pick oakum, but this is now chiefly done by machinery. The rope or junk is old rigging and cables bought up for this purpose. It is first cut by a powerful knife into short lengths, and these are thoroughly steamed to dissolve out the tar. The strands being then pulled apart, they are spread in the sun to dry. After this they are torn in pieces and cleaned of dust in carding machines, a succession of which are used, until the oakum is obtained in clean light fibres. Since the passing of the wooden ship, oakum is very little in demand.

Oannes, ʔ-ān-nēz, in Babylonian mythology, a god of the sea, described as having the head and body of a fish, to which were added a human head and feet. In the daytime he lived with men to instruct them in the arts and sciences, but at night retired to the ocean.

Oar Fish, or **Band-fish**, one of the ribbon-fishes (*Regalecus bankii*), a peculiar deep-sea fish, 12 to 20 feet or more in length, with a narrow and extremely compressed body of a silvery color. It is only rarely met with and

usually in a dying condition, as its proper home is in the depths of the sea.

Oda, ʔ-ās', Philippines, a pueblo of the province of Albay, Luzon, situated in the Inaya River, 15 miles northwest of Albay, the provincial capital. It is on the main road between Ligao and Polangui, has a considerable river trade, and is the centre of one of the finest hemp-growing districts of the province. Pop. 15,987.

Oa'mia, a fertile place in a desert, usually found where lack of vegetation is caused by lack of moisture. Some of the mountains in the Sahara are of sufficient height to cause condensation of moisture and rainfall; and as much of the soil has all the ingredients necessary for productiveness, an oasis is formed. Springs sending out enough water to moisten the soil aid in the formation of fertile spots; and artificial means are now used; the artesian wells are assisting in making productive places in the Sahara. See SAHARA.

Oat Grass. See GRASSES OF THE UNITED STATES.

Oates, ʔta, Titus, notorious English perjurer, the fabricator of the story of the Popish Plot: b. Oakham 1649; d. London 12 July 1703. The son of a clergyman of the Church of England who had become an Anabaptist preacher and in 1654 was expelled from a chaplaincy in the Parliamentary army, he was turned out of successive schools and took no degree at Cambridge, but was ordained and became vicar of Babbing in 1673. Soon after he was vicar to his father, with whom he circulated such outrageous stories against a schoolmaster of the parish that they were expelled from the living. After various ups and downs, about 1676 he conceived the idea of informing against the Roman Catholics; he became a Roman Catholic in 1677, studied at Valladolid and St. Omer, but was expelled from both, and 1678 gave information as to a Popery Plot against Charles II., intended to seat upon the throne James, Duke of York, and turn the country over to the Jesuits. He received a large governmental pension and his story was implicitly believed, resulting in the judicial murder of 35 innocent persons. But in two years the excitement somewhat subsided; and upon the accession of James II., Oates' pension was withdrawn and he was put on trial for perjury, was found guilty, fined, condemned to stand in a pillory, and be imprisoned for life after a terrible flogging, which he survived as by a miracle. His sentence was reversed after the accession of William and Mary; he was set free and received an annual pension of £300. In 1693 he married a rich widow and a few years later joined the Baptist congregation and preached among them, but was soon expelled. Consult: Roger North, 'Examen,' and 'Lives of the Norths'; Thomas Seecombe, 'Lives of Twelve Bad Men' (1894); Burnet, 'History of My Own Time' (1883); and the English histories of Hallam, Lingard, and Macaulay.

Oaths and Affirmations (Judicial). A judicial oath is a solemn declaration made in some form warranted by law, before a court of justice or some officer authorized to administer it, by which the person taking it promises to tell the truth, the whole truth and nothing but the truth, in relation to his knowledge as to the matter then under consideration, and appeals to God to wit-

OAKLAND.

CITY HALL SQUARE.

OATS—OAXACA

ness his sincerity. It is distinguished from an extra-judicial oath in the fact that the latter is not made under any warranted form of law, and has no binding force, except in the conscience of the one taking the oath. An affirmation is made in place of an oath by a person conscientiously opposed to an oath, and it is a declaration which is equivalent in law to an oath. Oaths are of extremely ancient origin, and are not peculiar to Christianity, having been used by nearly all nations in the world. Affirmations in place of oaths were the result of a statute first enacted in England for the benefit of those to whom the invocation of the Deity was objectionable. Generally under the present laws, only those persons included within the statutes permitting an affirmation to be made in place of an oath, have such right. Authority to administer oaths is an incident to judicial officers. All persons having sufficient intelligence to appreciate the nature of an oath and believing in the existence of a Supreme Being, who demands a moral obligation to speak the truth when under oath, are competent to take an oath.

In nearly all of the United States, through statutory enactment, it is provided that every person believing in a religion, not the Christian religion, may be sworn according to such ceremonies as his religion may have; a substantial compliance with the provisions of the statute as to the form of an oath is usually sufficient, the test generally being as to whether or not the person taking the oath would be liable for punishment for perjury in the event that such oath had been violated. Any person lawfully required to depose the truth, and making a wilful false oath on any material point, whether he believes it or not, is subject to be held for perjury, and punishment therefor in accordance with the statutes under which he may be indicted. See also EVIDENCE; LAW, CRIMINAL; WITNESS.

Oats, various grasses of the genus *Avena*. The best known species is often subdivided into Tartarian oats (*A. orientalis*) and common oats (*A. sativa*). In the former variety the panicles are one-sided and somewhat contracted; in the latter they are loose and spreading. The origin of common oats is in doubt, but many writers suppose that they are derived without hybridizing from a Tartarian species now unknown to botanists. The numerous varieties of this species vary greatly in color, size of grain, height, etc., and more or less in composition. Other species are cultivated to a small extent but are mostly considered weeds. The best known of these are probably animated oats (*A. sterilis*) whose seeds move with varying amounts of moisture; wild oats (*A. fatua*) valued in some places, for example, California, for pasturage, but generally regarded as a noxious weed; bristle-pointed oats (*A. strigosa*) used sometimes like the preceding but also considered a weed; and short oats (*A. brevis*) cultivated at high altitudes for its seed which matures where other cereals fail.

Oats succeed well upon a great variety of soils if these are well supplied with moisture. They will not do well in wet soil nor in hot countries, though in warm regions they succeed if the soil is moist enough. They thrive best in temperate climates, in many of which they

rank as one of the most important cereal crops. The land is plowed and harrowed usually in spring and the seed either sown broadcast or drilled in at the rate of about three bushels to the acre. In the western United States the seed is commonly sown broadcast upon cornland which has been prepared only with the harrow. In the eastern States the ground is usually plowed previous to sowing. Since the plants are very hardy the seed may be sown as soon as the ground can be worked in spring, a practice which insures an early development of the plants under favorable conditions. In about three months the harvest usually occurs in northern countries; in southern regions a somewhat longer time is necessary because of the shorter days and usually drier conditions. Though the average yield per acre in the United States was, during the last decade of the 19th century, 26.14 bushels, yields of more than 50 bushels are common under good management, especially in Europe.

Oats are rather exempt from the attacks of specific insect enemies; and the means of combating the general cereal enemies are the same as for wheat, barley and other grass and grain insects. They are subject to the attacks of several so-called plant diseases, of which the best known are rust and smut. Since these are less troublesome upon early maturing varieties, these are chosen in regions which seem to be infested. They also have another advantage in that they are less likely to lodge than taller and later growing varieties.

The oat has long been considered one of the most valuable of cereal grains. Treated as a grass it makes an excellent forage, fodder or hay; and as a grain it is one of the standard feeds for domestic animals, particularly the horse, and is widely used as human food, especially for making porridge. In the manufacture of what are called "breakfast foods" the oat takes an important part, and the by-products, such as hulls (the outer covering), bran, middlings, and "oat dust" are largely sold to stockmen for mixing with other feeds. The whole grain has the following average composition: Nitrogen-free extract, 59.7; protein, 11.8; water, 11.0; crude fibre, 9.5; fat, 5.0; ash, 3.0. Since analyses have failed to reveal the presence of a supposedly stimulating principle called "avenin," chemists and other investigators have concluded that such a principle does not exist.

Consult Morrow and Hunt, 'Soils and Crops of the Farm' (1892), and books upon general farming.

Oaxaca, wā-hā'ká, Oaxaca de Juarez, dā hoo-ā'rēth, or Oajaca, Mexico, a maritime state, bordering on the Pacific Ocean, and bounded on the north, east, and west by the states of Puebla, Vera Cruz, Chiapas, and Guerrero. Area about 26,778 square miles. The principal mountain ranges are the Sierra Madre, which crosses the whole state, and Sierra del Sur, near the coast. See MEXICO—THE STATES OR.

Oaxaca, Mexico, city and capital of the State of the same name. The situation, in the midst of a fertile valley, the rivers Atoyac and Jalatlaco flowing through it out into the Oaxaca valley, is most attractive. It is 288 miles southeast of Mexico City, by railway, and is

5,067 feet above sea level. It enjoys an unlimited supply of pure water, by means of two aqueducts, one of which was built in 1755 and the other in 1880. Transportation facilities are supplied by the Mexican Southern and Oaxaca & Ejutla railways. There is a local bank,—the Bank of Oaxaca,—which, together with branches of the National Bank and the United States Banking company, and an agency of the Bank of London and Mexico, supply the financial needs of the community. Within the last few years the city has assumed much prominence as a base of supplies and headquarters for the many and rapidly developing mines of the State. The streets of the city are laid out somewhat like those of Washington, are lighted by electricity and are well paved and clean. The general style of architecture is Spanish, and the most notable edifices of interest are the Government Palace, the Palace of Justice, the Municipal Palace, Federal Building, Museum and Institute of Science and Art, the Normal School, State Hospital, Charity Hospital and the Municipal Necropolis. The educational institutions include a number of primary schools, the State Institute of Science and Art, in which are taught jurisprudence, medicine, obstetrics, pharmacy, telegraphy and business methods; the Normal School for Men and the Normal School for Women, in which both primary and advanced instruction is given. Two museums—the Oaxaqueño and the Fernando Sologuren—are devoted to the investigation and study of archaeology and the natural sciences. The State Library and the Clerical College Library contain, together, 23,000 volumes. The Cathedral of the city was founded in 1553 and completed in 1730, and is an imposing edifice of gray stone. There are many public gardens or parks—among them the Zocolo, Guadalupe, San Francisco, Netzahualcoyotl and the Constitution. The city is believed to have been founded before the conquest and to have been an important place long before its discovery by the followers of Cortez; was occupied by the Spaniards in 1521, constituted a city by royal charter in 1532 and given the full name—Oaxaca de Juárez,—in 1872. Here were born and reared several of the greatest men of Mexico,—among them President Díaz; the present and long time Secretary of Foreign Relations, Ignacio Mariscal, the late Mateos Romero, many years Minister of Mexico to the United States; and in a poor little hamlet not far distant, the Washington of Mexico—Benito Juárez. Pop. about 35,000.
